This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE LAND OF THE HITTITES.

PLAIN OF THE JORDAN ABOVE JERICHO.

BEFORE threading the winding paths of Southern Palestine, or entering upon a description of any particular portion thereof, it may be well to take a bird's-eye view of the general aspect of the country of which the land of the Hittites anciently formed no inconsiderable part.

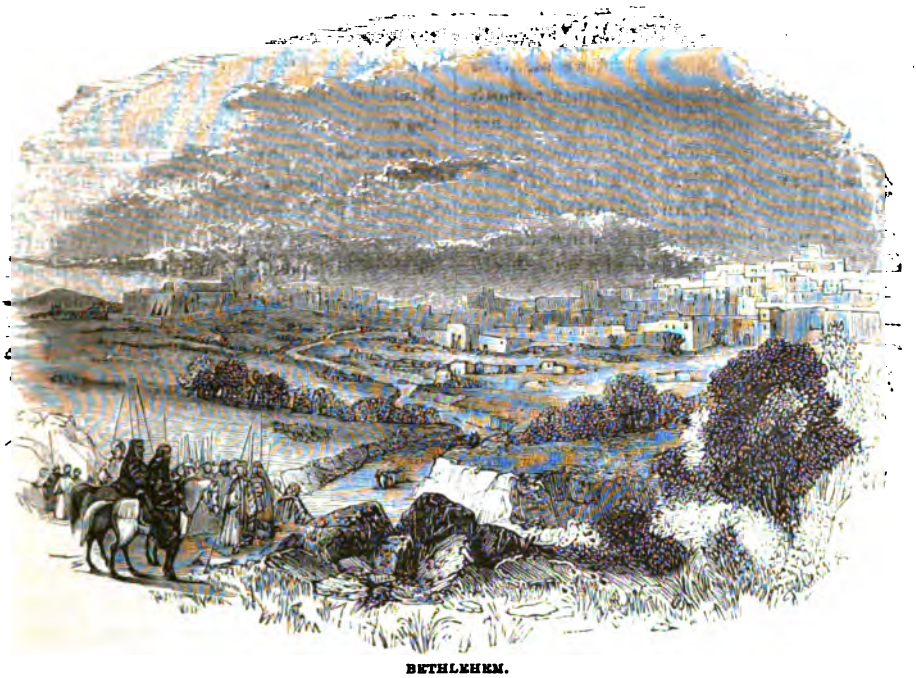
Palestine, like Greece, is a country of small extent of territory, and appears especially so when contrasted with the great events of which it has been the theater. In the north, the country is but some twenty miles wide; in the south, its widest part, it barely stretches to ninety; thus yielding an average breadth of about fifty-five miles. Its extreme length is only one hundred and eighty miles. This is Palestine proper, the original Land of Promise—that portion emphatically termed "the Lord's Land;" the only spot on earth of which Jehovah has declared "the land is mine." And yet on this limited area—but as a hand's breadth compared to most other countries—more important events have been enacted than on any other portion of the wide world. When, however, the Lord was about to make of Israel a nation, and for that purpose brought Jacob's descendants out of Egypt to take possession of the land he had promised their ancestors to bestow upon them, a large territory lying east of the Jordan fell into their hands by right of conquest, of which they took possession, and the tribes of Reuben, of Gad, and a large portion of Manasseh established themselves east of the Jordan. This gave to the Israelites an accession of

territory, which, while it added little or nothing to the length of the country from north to south, nor gave it any increase of breadth in the south, added largely to its width in the northern and middle sections, and increased the average breadth of the land to about sixty-five miles.

Even with this enlargement the country only attains an extent of ten thousand square miles—a measurement about equal to the territory of Massachusetts and Rhode Island united, or considerably less than one-fourth of the dimensions of the State of New York. The real surface is, however, much larger than the comparison would imply; for Palestine being essentially a hilly country, the slopes of the hills add somewhat to the available surface.

The southern part of Palestine abounds in such hills and valleys, the former being generally of moderate height and of every conceivable form. The bed-rock is chiefly of limestone, and readily disintegrates into soil, which, when upheld by low stone walls (as were once universal on those hill-sides), preventing the soil from being washed into the valleys, rendered the hills cultivable in a series of long, narrow fields, gardens, or vineyards, from base to summit. Thus these hill-sides were enriched and beautified by a luxuriant growth of the olive, the fig, the grape, and other fruits, as well as such vegetables as were needed by the people, while the valleys bore exceedingly heavy crops of wheat, barley, and other cereals. But by the decadence of the Jewish nation, the ravages of war, and especially the driving away of settled inhabitants, came desolation and ruin. By degrees the terrace walls fell or were thrown down; the heavy rains washed away the unsupported and friable soil, until the upper portions of the hills, denuded of that which had clothed them with fertility, became naked and barren rocks. This is now the general character and appearance of this portion of the country; though here and there a spot is still found on which, a little unusual care having been bestowed, there is sufficient fruitage to suggest to the chance traveler how richly these hills once repaid the toil of the husbandman, and the abundance with which they may again, un-

TERRACE CULTIVATION.



BETHLEHEM.

der proper skill and culture, and under a stable and good government, reward the labor of patient and skillful toilers. "The more I see of Palestine," says an American traveler (J. D. Paxton), "the more I am persuaded that it was once one of the first countries of the world."

Of Judea proper, the most mountainous part is the country about Jerusalem, and between it and the head of the Dead Sea. More to the south the breadth of the country is less occupied by mountains, which are chiefly found in connection with the central ridge. Cultivation on the hills is most common for about half the distance from Jerusalem to Hebron; in the other half the uncultivated hills are more or less wooded. The only mountain in this section that can be seen from far is the Frank Mountain, about five miles south-east of Bethlehem. It was a fortified post of the Crusaders, and would seem to have been in those times almost impregnable, for not only is it high, but so steep that Nan was obliged to dismount at its base and climb on foot to its top. Robinson was obliged to do the same. President Bartlett, who was in Palestine in the early part of 1874, compares the section of country between Bethlehem and Hebron to the stony parts of New Hampshire, except that the rocks of Palestine, being limestone, and not as are those of New Hampshire, granite, rather aid than detract from the fertility of the country. Then, too, the singular variety of surface and of climate, caused by its constantly recurring elevated hills and deep valleys, make it capable of producing almost every kind of fruit, flower, and grain. He, too, concludes that Palestine must have been indeed a goodly land, "presenting to its children attractions beyond even those of Scotland, of Switzerland, or of New England."

The road from Jerusalem to Bethlehem runs through a valley of some six miles in length by an average breadth of a little less than two miles. Its direction is nearly south, the divergence being slightly to the west. About thirty minutes' travel from Jerusalem, on the eastern side of the road leading to Bethlehem, a little way back in the fields, and on the verge of the ridge,

stands the Convent of Mar Elyas (St. Elijah). As a matter of veritable history, scarcely excelled in Baron Munchausen, we mention the marvel of this place, namely, a smooth piece of rock opposite the gate, on which are found certain depressions, such as, were the rock sand, might be left by a human body reclining there. It is an indentation made by the sleeping prophet Elijah, when, fleeing from Jezebel, he sought this stone to obtain a little rest! Whether, when he awoke, he found the impression he had made on his stony couch, we know not. Can monkish credulity go beyond this?

THE VALLEY OF THE SHEPHERDS NEAR BETHLEHEM.

Bethlehem shows to great advantage from this point; and the convent commands, too, a wide and picturesque prospect across the deep valleys of the south. Some ten minutes beyond, in a south-west direction, lies the tomb of the beloved Rachel. It is a plain Saracenic mausoleum, having no claim to antiquity in its present form, but doubtless marking the very spot which the afflicted patriarch chose as a final resting-place for his favorite wife. Some forty years after her burial, Jacob, then about to die, narrated the circumstance to Rachel's oldest son, Joseph, saying, "When I came from Padan, Rachel died by me in the land of Canaan, in the way, when yet there was but a little way to come unto Ephrath;" "the same is Bethlehem," has been added by some later hand, probably by Moses. "And," says the same historian, "Jacob set a pillar upon her grave." That pillar, possibly merely a rough stone shaft, would seem to have been standing at least some six hundred years afterward, when Samuel dismissed Saul, after anointing him as future king of Israel. (1 Samuel x, 1, 2.) But however humble the original "pillar" and its succeeding monument, they serve to perpetuate a fact to which Jew, Christian, and Moslem alike give their adherence; and the site of Rachel's tomb is one of the few historic places the truth of which is rarely questioned. The precincts of the sepulcher are now used by the Turks as a cemetery. The desire which these people feel that their ashes may rest in this spot is described by Mr. Carne as "singular and ex-

treme." All round this simple tomb lie thickly strewn the graves of the Mussulmans.

Let us diverge a little from the direct road to Bethlehem to note another scene connected in the mind of Bible students with the name Rachel, and which may as well, therefore, be here introduced. "Not four hundred yards from Rachel's tomb," says W. M. Thomson, "the guide showed us a heap of old rubbish, which he said was called Ramah." This tale Dr. Thomson regarded to be a modern invention. "One thing, however," he observes, "is certain, that if there was such a name attached to any site in that vicinity all obscurity would at once vanish in regard to that much controverted reference to a Ramah in Matthew ii, 18, 'In Rama was there a voice heard, lamentation, and weeping, and great mourning, Rachel weeping for her children, and would not be comforted because they are not.' Whether this Ramah is in fact the one that existed in the time of Herod is problematical, but not, I think, the fact that there was such a place in that vicinity when Herod slew the infants in and about Bethlehem. Neither of the present well known Ramahs could be meant, they are too far off and separated from Bethlehem and from Rachel's tomb by other villages and intervening mountains and wadies. The name Ramah, in some of its forms, is applied to *any* place seated on a hill; and there may have been—apparently, in historic truth, *must* have been—one of them somewhere near Rachel's tomb." G. Robinson speaks of a village of Rama as lying about two miles westward of the tomb of Rachel. (Lacks confirmation.)

Rev. Dr. Olin describes the first appearance of Bethlehem as being "very striking and its environs as beautiful, though not well cultivated." The soil he accounts fertile, and the steep hill-sides and valleys he describes as "covered with figs, olives, pomegranates, and grapes." "This delicious spot," he says, "may perhaps be taken as a specimen of the general appearance of the hill country in the prosperous days of the Jewish state, and of what it might once more become under the fostering care of a good government, and of an industrious, civilized population. But it is only under the walls of considerable towns that agriculture is now at all practicable. Within two miles of Bethlehem fields are permitted to lie waste which once employed and amply repaid the labor of a numerous peasantry. It is vain to till them; for the Bedouins, who are always in the vicinity, seize and carry off the fruit and corn even before they come to maturity. Even in broad daylight these marauders do not hesitate to drive their beasts through fields of wheat under the owner's eyes, and they graze their animals upon them without scruple. Of course, under such discouragements but little attention is paid to agriculture."

"As we neared the town of Bethlehem," says Hodder, who has an eye for the picturesque and a heart to be moved by association, "it looked the perfection of beauty,

GRAPES OF PALESTINE.

for 'distance lends enchantment' to a view nowhere more than in the Holy Land. None of us had need to be told 'that is Bethlehem.' Who has not drawn a picture in his mind's eye of the surroundings of that sacred place where the Savior of the world was born? I have for one, many a time, and strange to say 'the clairvoyance of the imagination,' as Sir E. B. Lytton calls it, was true. Bethlehem was *my* Bethlehem."

It is built upon a narrow ridge projecting eastward from the central mountain range, and the approach to the village is so steep that one traveler says the party with which he journeyed had to cling to their horses'

VALLEY OF THE KEDRON, LOOKING NORTH.

manes to keep themselves from sliding backwards off their saddles. Whether, however, this was owing to the steepness of the ascent or the lack of skill in the horsemen does not appear. The hill is bounded on the east, north, and south by deep valleys. Conder says in his "Tent Work in Palestine," that the town is built on the summit of two knolls, connected by a lower saddle. Constructed of grayish limestone, well built, square in form, and crowned with small domes, the dwellings rise above each other in somewhat regular gradations. The streets are few and narrow, and paved. Though not surrounded with a wall, Bethlehem has two gates, which are closed at night. From the gate at the western extremity to the Convent of the Nativity, which occupies the eastern end of the village, the distance is about half a mile. The entire length of the ridge is perhaps double this measurement. The population is almost entirely Christian, and is now estimated at about five thousand persons. It is a thriving modern town—the birthplace of a faith that looks forward and not back.

"The tradition which fixes the grotto in the old Basilica at Bethlehem as the site of the stable where Christ was born, is," says Conder, "the most venerable of its kind in existence, the place being noticed by Justin Martyr in the second century. The tradition seems to me credible because, through this part of Palestine, there are innumerable instances of stables cut in rock resembling the Bethlehem grotto." In the monastery Latin, Greek, and Armenian monks find a common retreat, each of them having certain parts allotted to their exclusive use, while other parts are held by them in common.

Two spiral stair-cases lead down to the cave of the Nativity, twenty feet below the floor of the church. The cave is lined with Italian marble, and in a small recess near the eastern end of the grotto is shown the spot where the Virgin is said to have given birth to the infant Savior. In a small semi-

circular niche cut in the flooring is placed a silver star, said to be directly under the spot occupied by the star which had guided the Eastern magi when it stood in the mid heavens "over where the young child was." How the monks learned this wondrous *fact* is not stated.

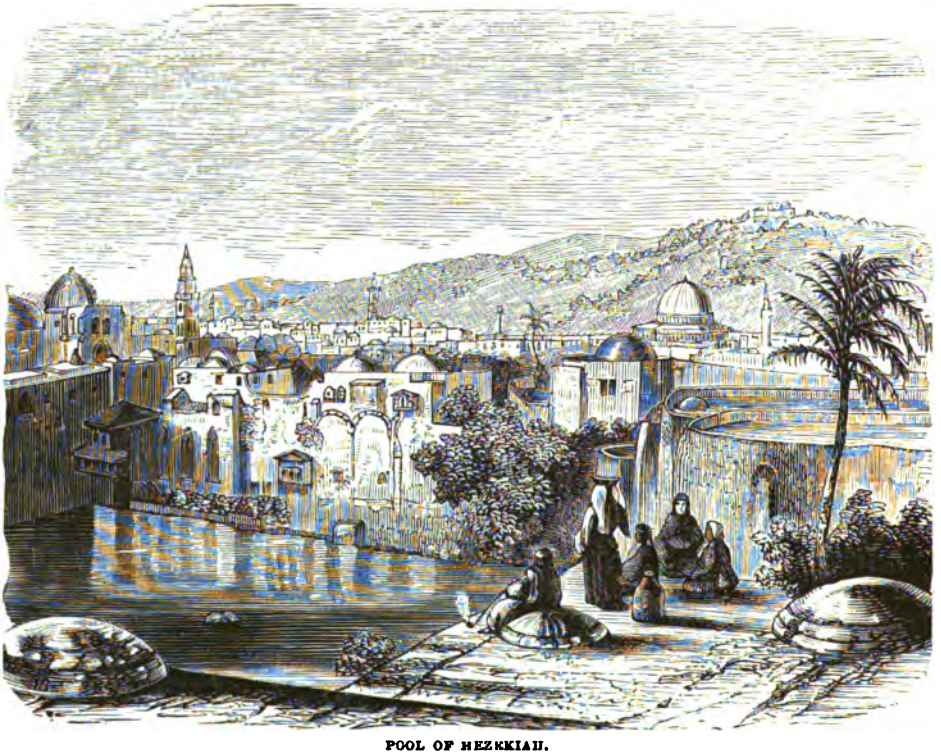
East of Bethlehem is a narrow plain or open valley, with white stony slopes and a few crumbling ruins. It is here that Migdal Eder, "the Tower of the Flock," is supposed to have stood, and where, according to Jewish tradition, Messiah was first to appear. It is said to have been on this plain that the angelic messenger appeared to the shepherd and that the Gloria in Excelsis was first sung, the choir being a celestial one. "And suddenly there was with the angel a multitude of the heavenly host, praising God, and saying, Glory to God in the highest, and on earth peace, good will toward men."

It was in this plain, doubtless, that the beautiful pastoral of Boaz and Ruth was enacted. (See Book of Ruth, chapter i, 22; ii, 23.) The Moabitish maiden had made request of her mother-in-law, Naomi, to allow her to go, in accordance with the custom of the country and the law of the land (Lev. xix, 9, 10, and Deut. xxiv, 19–21), and glean ears of barley. The request was granted, and thus Ruth became acquainted with Boaz, her future husband, and ancestor of David and of Christ. This gleaning was the gathering of such ears of grain as fell from the hand of the reaper or binder. A similar practice prevailed until of late years in England, and was claimed by the gleaners as a right. It has been there decided, however, by the court of common pleas, that no such right can be claimed at common law.

Were I not already verging into the years that usually bring with them sedateness and sobriety, rather than gallantry, I might speak of the proverbial beauty of the females of Bethlehem. I may, however, quote the language of a younger traveler. "Every body," he says, "has heard of the beauty of the females of Bethlehem, but nobody has heard enough." One of this young traveler's companions says, "The girls of Bethlehem are charming!" He had been visit-

JEWS' WAILING PLACE AT JERUSALEM.

ing a family in which were two daughters—one about sixteen, and the other about seventeen years of age. "Such lovely eyes, dark and lustrous, such black, glossy hair, rich and wavy; such teeth of pearly whiteness; such finely rounded limbs, and every movement graceful! How I wished I could have spoken to them in their native tongue. They showed us the curiosities of their home, and their clever needle-work, with a frankness and modesty which an English lady might have envied." He is surely



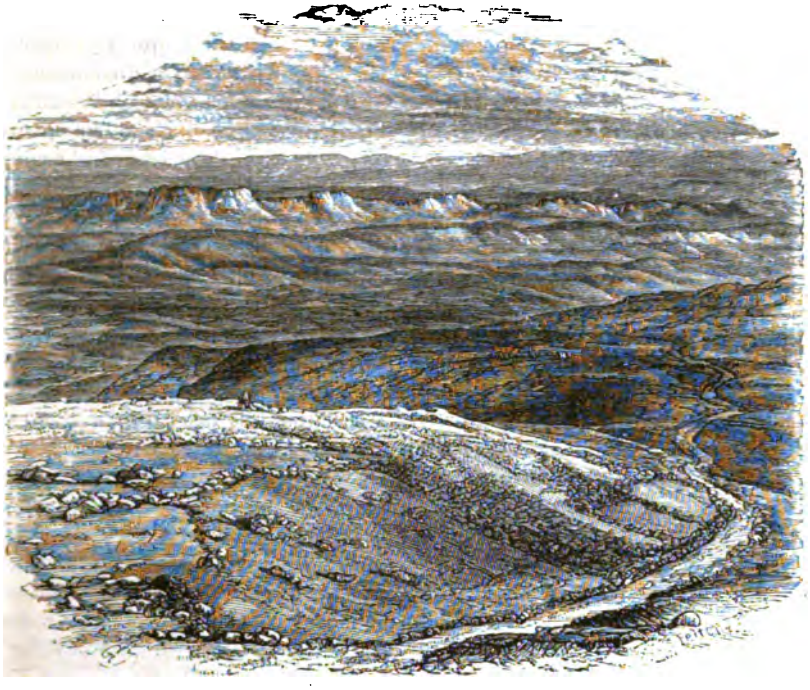
POOL OF HEZEKIAH.

smitten. Ah, well, there is such a thing as love at first sight; whether this be such, the reader can determine as well as I.

"Half an hour from Bethlehem," says Mr. Hodder, whose course now lay through a wady running eastward, "we lost sight of pleasant groves and vine terraces, and soon after came into a desolate region, with bare, barren hills and gloomy ravines. There were places where you might commit suicide in a moment by just turning your horse a trifle to the left, and everybody would be

sure to say it was an unavoidable accident. I suppose almost every one has, at some time, when standing near the verge, or passing along the edge, of a dangerous height, experienced an almost irresistible temptation to throw himself down headlong. I once heard it suggested that this was the Devil's temptation to our Lord when he took him to the pinnacle of the temple and bade him cast himself down. I have often seen places that are really worse; but I never traveled on any road, and certainly never on horseback, that seemed worse than the part of this road of which I speak. We went over worse places than these later in our journey, but nothing in Palestine impressed me with a greater sense of danger than the ride from Bethlehem to the gorge of Kedron."

The road from Bethlehem to Mar Saba is represented by President Bartlett as being exceedingly rough and circuitous, occasioned by the necessity of frequently skirting the hills, very much as one would have to do, who,



WILDERNESS OF JUDEA.

ignoring the regular roads and fondly following sheep paths, should take a ride over the roughest hilly portions of Vermont and New Hampshire. Yet this roughness is not incompatible with singular fertility and productiveness when under cultivation. "On the way," says the president, "as we reached the sunny exposures, we could look down over the green slopes and declivities, perfectly brilliant with a carpeting of flowers of every bright color. I have never seen any thing to compare with the abundance and variety of this floral display." This was toward the close of March. Below we give another and very different picture.

After a while the traveler by this route strikes the southern edge of the deep gorge of the Kedron, which leads down eastward from the foot of the hills on which Jerusalem stands to the Dead Sea. On the southern side of this wild gorge stands the Convent of Mar Saba, a famous settlement of Greek monks. Bartlett declares it to be "the strangest building in Palestine, and one of the most singular places in the world. It is perched on the very edge of the deep rock ravine, and is made up, inside and out, of an odd mixture of natural rock and masonry." Dr. Ridgaway says, "It is such a mixture of rock and of buttresses, of nature and of art, that it is difficult always to tell where God's hand ceased and the hand of man began to work."

"The Mar Saba," says Conger, "clings to the side of a precipice some four hundred feet high, and is built up the cliff with huge flying buttresses to support the walls. The buildings are scarcely distinguishable in color from the brown crags on which they stand. The huge crevice (the ravine) which seems to have been rent in some great convulsion of nature, is bare and tawny, like the rest of the country. The silence of the desert surrounds it, and only the howl of the jackal, or the shrill note of the golden grackle—a beautiful blackbird with orange-colored wings, the note of which is beautifully clear, and is the only pleasant sound ever heard in this solitude—breaks the solemn stillness. The place seems otherwise dead."

Having entered the convent (no females are admitted)* the traveler finds himself in one of the strangest places that human ingenuity ever contrived for a dwelling-place. You look down at buildings and court-yards and labyrinths of passages, and up at curious holes in the walls with ledges in front, which are the cells and dwelling-places of monks. The place is full of mystery. You see men walking upon ledges of rock, and turning into holes in the walls, and you look upon a little garden hanging in the air, as it seems, looking wonderingly down into the chasm, in which are more buildings and chapels and cupolas. None but the initiated could ever find their way through these mysterious labyrinths, and once within those stony walls woe to him who would try to get out! Among the curiosities of the place visitors are allowed to see, none attracted the curiosity of Mr. Hodder as did an old clock "which had written on its face, 'George Clark, maker, Leadenhall Street, London.' I would give a trifle," remarks this gentleman, "to know the history of that clock, and to trace its adventures from the time it left the busy crowds of London until it took up its abode forever in the ravine of the Kedron."†

"The walls within the convent," says Conger, "are covered with frescoes, some old, some belonging to the time when the monastery, in 1840, was rebuilt by the Russian government. The floor of the church is paved with marble, the transept is closed by a great screen blazing with gold. The monks, whose pale, sad faces speak of ignorance and hopelessness, and sometimes of vice and brutality, are among the most degraded representatives of Christianity." Dr. Ridgaway says, "They are far superior in appearance to those of Mt. Sinai." "Yet even for these poor outcasts, in this stony, treeless, and almost lifeless wilderness," continues Conder, "nature prepares every day a glorious picture, quickly fading, but matchless in color. The distant ranges seem stained with purple and pink. In Autumn the great bands of cloud sweep over the mountains with long bars of gleaming light between, and for a few minutes as the sun sets a deep crimson blush comes over the rocks and glorifies the whole landscape with an indescribable glow."

The three travelers whose route and description are above given, went from Bethlehem to Mar Saba. There is, however, a nearer and more direct route from Jerusalem. This latter was taken by Dr. Pococke. It lies all the way through the Kedron valley. He says, "We went to the south-east, along the deep and narrow valley in which the Kedron runs. It has high rocky hills on each side, which are shaped into terraces, and doubtless produced formerly both corn and wine. . . . About six miles from Jerusalem we ascended a hill to the south, from which we had a prospect of Zion, the Mount of Olives, and Bethlehem. We then went about an hour on the hills, and, descending a little to the south, came to a lower ground, where we had our first view of St. Saba. Then turning east, in less than a mile from there we arrived at the convent."

"If the road from Bethlehem to Mar Saba is so bad," asks Hodder ("On Holy Ground," page 112), "what can be said of the road to the Dead Sea, which is worse?" Why, surely, that it must be bad enough! After five hours' travel among naked gray ridges and naked gray ravines, a scene burst on the view of this party, "which," they say, "might reasonably take away the breath." "Before us stretched the long chain of the mountains of Moab, like a huge blue wall; beneath it lay that great and melancholy marvel, the Dead Sea. It was a view which I had not expected, never having associated the idea of beauty with the Dead Sea or the wilderness of Judea; but from the height on which we were the effect was really very fine."

The outline of the mountains of Moab, as seen in the peculiar atmosphere of the Holy

*"It was a source of great vexation to the ladies of our party to be obliged to remain outside the convent until our explorations were over, for these unnatural creatures glory in the fact that never, under any circumstances whatever, even of distress or danger, have they admitted any member of the gentler sex to enter within their walls. God help them, poor fellows! they make a grand mistake."

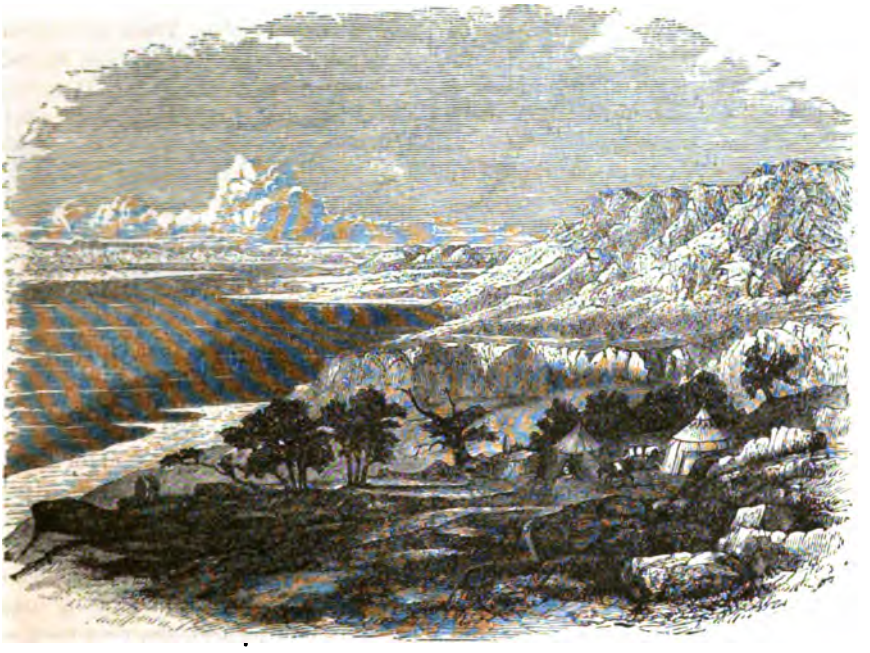
†There is here a library said to be rich in valuable manuscripts, but it is kept from the inspection of strangers. But a few Europeans or Americans have inspected it.

Land, would redeem any view from tameness. "I have seen them," says Mr. Hodder, "from great distances and close at hand; sometimes luminous with the golden light of sunset, sometimes dark and somber in the gloaming, ofttimes wearing that rich blue tone which painters introduce into their pictures, and which the uninitiated are apt to declare overdone with color; but always in whatever light and from whatever view, the hills were beautiful."

To illustrate the clearness of the atmosphere we have the following: "After we had been more than an hour approaching the sea, which seemed very near, one or two of us, tired of riding, gave up our horses and took to our feet for a stroll. We thought half an hour must certainly bring us to the shore; but distances are so very deceptive in Palestine, that an object ten miles away seems sometimes to be but comparatively a stone's throw off. So we found it on this day; for after a six miles' walk under a burning sun, we were glad to get on our horses again, for our destination seemed as far off as ever.

"We noticed, as we descended to the plain, what so many travelers have observed and described, namely, an exhalation like a white cloud rising from the sea, in exquisite relief with the dark blue of the hills of Moab behind it, and assuming at times a fantastic spiral shape.

"At length we reached the plain, and making our way through a strange jungle of curious vegetation—the most remarkable of all in appearance being a kind of reed with pods full of something like cotton wool—we came to the shore of the lake. Here, again, I was 'agreeably disappointed,' and looked in vain for the awful gloom and deathliness I had expected to find. The shore was not strewn with masses of dead and whitened trees; the water looked bewitchingly bright and beautiful and reflected every minute detail of the surroundings as in a burnished mirror. But this was a first impression. After an hour or so upon its shore I experienced its awful stillness and *felt* the absence of life. I can not define the solitude of the place. There is a something which you *feel* more than you *see*."



THE DEAD SEA, LOOKING SOUTH.

TYROL AND THE LAKES OF ITALY.

THE WARTZMANN, OVERLOOKING BERCHTESGADEN.

TYROL lies to one side of the most thronged routes of European travel, and is all the more interesting for that to lovers of nature and of simple customs. Modern fashions have intruded only to the edge of the main roads, while in all beyond the quaint life of the country is yet shown in its original purity. Even the guest at the grand hotels has only to step out of his buggy to find the people still dwelling and toiling in the ideal simplicity of pastoral mountaineers. Its mountains are overtopped, and there are grander glaciers elsewhere, but its natural features have a character and charms of their own; and its steep mountains, with often strange and fantastic forms, its roaring torrents, its deep valleys, at times swelling out into broad sweeps of plain, rich with the fruits of careful tillage, its quaint Alpine towns, with the ever present road-side crosses, the peasants, with their curious primitive costumes, caring for their little crops, frequently at the hourly peril of their lives, offer a succession of pictures full of beauty and never wanting in variety.

Tyrol is crossed by the roads leading from Munich in Bavaria, and Salzburg in Austria, to the Northern Italian cities, and is easily accessible. We may enter it with Mr. Waring by the Salzburg road, and take our first glance at it from a little mountain inn overlooking the Valley of the Salzach. Guarding the entrance to the valley stands the lofty fortress of the Salzburg. Two great peaks come close up to the foreground, one on either hand; while behind them, "stretching away into the distance, rises crest after crest of the Salzburg Alps." The momentary fear that we have made a mistake in choosing this entrance to the beautiful land is not unnatural, for "we could not hope again to see such a combination of beauty and grandeur as this far-stretching fertile plain and yonder snow-clad peaks." But the fear is groundless, for nature is inexhaustible, and in whatever of her moods we may observe her, where man has not marred her, we may take each successive scene, while we are loath to give up the last one, as a fitting and grateful substitute for it. With the present travelers, "the fear abated before a day had passed, and it never returned."

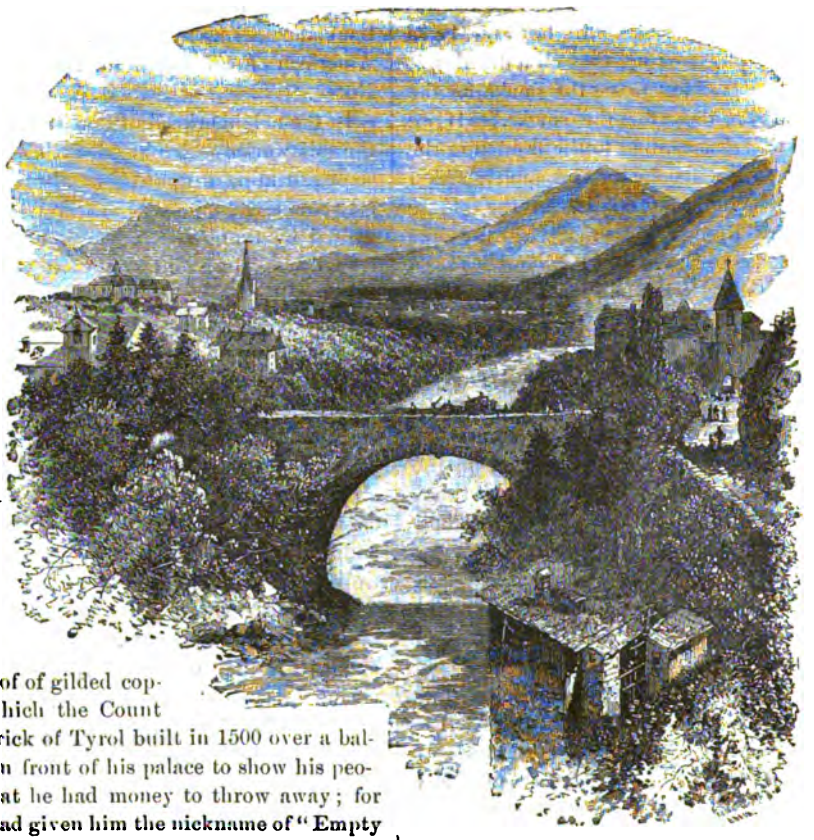
We may take our choice of a variety of

conveyances—mail and post wagons, including an omnibus, which will, however, be so full of people smoking, that on a dry day it will be impossible "to see the smoke for the dust, or the dust for the smoke." If we would travel according to the fashion of the country, we will take an einspänner, which seems to be to the Tyrolians what the caléche is to the French Canadians, or the one horse chaise to the New Englanders. It is a queerly shaped vehicle with a comfortable back seat for passengers, while the driver sits with his feet resting on the whiffletree; the horse is fastened to the left side of a pole and pulls with a cross-wise traction. The passenger will have to get accustomed to frequent halts to bait the team, but he should not be impatient; for as he saunters along he may enjoy the study of the people and their customs—and "time thus spent at way-side inns, among costumed peasants, here in the foot-hills of the great Alpine chain, is time gathered for the memories of all future years."

This particular excursion we are on, from Salzburg to Berchtesgaden and the Königssee, has been pronounced the most lovely of all excursions. Berchtesgaden is politically in Bavaria, but it is nevertheless an ideal Tyrolean village. It overlooks broad and rich farms in the valley below it, and is itself overlooked by the gigantic Watzmann mountain. Appearing to have pleasure for its chief industry, it produces a rare impression on the stranger, with a suggestion of theatrical effect. The Königssee is three miles away, lies two thousand feet above the sea, and is inclosed by mountains which rise almost vertically from its shores to the height of from six to eight or nine thousand feet. The excursion boats are generally rowed by women. Our party has "a comely, wiry-armed damsel, and two tough-sinewed, bare-kneed, cock-feathered young men, one standing at his oar after the manner of a gondolier." The principal landing is at St. Bartholomae, a royal hunting chateau, where one may eat the Saibling or lake trout, and drink, for the benefit of the royal treasury. Every boat carries some kind of a gun, to be fired off and awaken the echoes; this and the scenery of the lake furnish a close resemblance with the like features of our American Echo Lake in the Franconia Notch.

In the neighborhood of Berchtesgaden are the salt works, which are described as "the show salt-mine of the world," also the property of the king of Bavaria. They are visited by thousands of people every year, who, dressed in a fantastic mining costume, to please the theatrical taste of his majesty, not because it is necessary, are taken across an underground lake lit up by rows of miner's lamps, and made to ride on oddly contrived railways with odd cars, as they traverse its galleries.

Hence, by Pass Lueg, a marvelously deep cleft six miles long and often only wide enough for the river and the road, but which the Gisela railway threads through tunnels at its narrowest parts, to the Ziller Valley and the Inn River at Wörgl. The latter part of the route is "rich from end to end with grand mountain scenery, culminating in the great rugged marvels of the Wilde Kaisar," and then toning down to mere rounded forms, fertile slopes, and placid valleys. The views up the valley to Innsbruck are diversified with fields of Indian corn, wooded slopes, old castles and modern houses, and the ever-present mountains. Innsbruck is a "bright, bustling, cleanly, handsome," town, but annoyed by the strong winds which sweep down the gorges and fill the streets with dust. Such winds prevail, according to the official tables for an average of seventy-one days of the year, while of the other days one hundred and twenty are rainy, sixty-seven are quite cloudy, and only thirty-six are quite clear. The Maria Theresa Street, wide, and finely built, shows off to great advantage with the tall column of St. Ann, the triumphal arch of Maria Theresa, and the almost vertical wall of the snow-streaked mountains rising up "as if it were from the very heart of the town." The two principal sights of this capital derive their interest, one from its curious story, the other from its historical associations and its merits and fittingness as an artistic composition. The *Goldenes Dach*



MERAN, FROM THE KUCHELBERG.

is a roof of gilded copper, which the Count Frederick of Tyrol built in 1500 over a balcony in front of his palace to show his people that he had money to throw away; for they had given him the nickname of "Empty Purse." It is beautiful in itself, and is still prized for its beauty, monument of folly though it is. The tomb of the Emperor Maximilian, in the court church, or Church of the Franciscans, is one of the finest works of the kind in the world. The sarcophagus, in the middle of the church, supports the figure of Maximilian kneeling before the altar. At the corners of the slab on which he rests are beautiful figures, and on the sides and ends of the sarcophagus are twenty-four reliefs in marble, representing prominent events in his life. Surrounding the sarcophagus stand twenty-eight colossal bronze statutes of members of the emperor's family, his chosen friends, and the heroes he admired, including Clovis, king of France, Rudolph of Hapsburg, Theodoric, king of the Ostrogoths, King Arthur of England, Godfrey of Bouillon, and Ferdinand of Aragon.

The Tyrolean patriot, Andreas Hofer, is buried in the same church, his remains having been taken here in 1823. His story is a touching one, and is familiar. A simple country innkeeper, he rose to defend his country against the invasions of Napoleon, and with his little army drove the enemy out of the valleys five times in a single year. After a signal victory at Isel Berg, he was, in the absence of the Austrian chiefs of the land, made governor of the country, and ruled it from the royal palace for five dollars a day. The emperor of Austria gratefully acknowledged his services with a gift of golden ornaments and a coat of arms; but he refused to believe that peace had been declared, and, continuing to resist the French for a few days too long, was overcome, betrayed, and delivered to Napoleon, and shot by his order. He is only a modern hero, and that only of a year, but no man has been more honored. His statue represents him as a

Tyrolese peasant, with a rifle on his shoulder and a banner in his hand. His portrait in the museum "represents a sturdy Teutonic countryman, gorgeous with the embroidery and green and red of the costume of the valley." Tablets have also been put up in memory of his companion leaders and a monument to those who died with them.

In an adjoining chapel are the graves of Ferdinand II, Count of Tyrol, and of his wife, Philippine Welser, the daughter of an Augsburg merchant, who was considered the handsomest woman of her time, and "whose virtues and gentle character no less than her beauty so fixed her memory in the hearts of the people that she is as real a personage to them now as when she lived among them three hundred years ago."

Some travelers complain that Tyrol too is becoming contaminated by the rush of fashionable tourists, bringing new and strange customs and uprooting the old. The influence of the throng seems to be as yet only superficial. The grand hotels, where the waiters wear white neck-ties and swallow-tailed coats, do not dominate the land; and even in much frequented inns, the waiting is yet done by the mistress and her girls, the old customs of kitchen and table are adhered to, and the prices are so low that they can not have risen. In the busiest street of Innsbruck and about the Kursaal at Meran, "broad necklaces, bright colors, bare knees, and hat feathers are by no means exceptional. In the side streets of either town there is no more suggestion of any foreign influence than there was before railroads had been invented." The curious and picturesque costumes of the land are conspicuous every-where. The dress, particularly of the women, varies in the different valleys. Generally it is to be seen in its fullness only on Sundays and feast days; but in some parts the people wear it on week-days, although most often, as is the case the world over, it is "sobered by the rust of long use." The women, after the fashion of whatever valley their dresses may be patterned, depend upon bright colors and jewelry. The men's dress "resembles that with which we are familiar only in coat and shirt. The breeches are of black leather, with green cord down through the seams and green embroidery at the hip and knee; they reach only to the top of the knee, and are so loose that in the sitting position half the thigh is exposed. No stockings are worn

MALE TYROLESE COSTUME.

under the heavy hobnailed shoes, but a very thick woolen stocking leg, often ornamented with green figures, covers the calf, the top being rolled down over the garter. For the length of about six inches at the knee the leg is quite bare, tanned, ruddy, and hirsute with life-long exposure in a climate of great Winter severity." The hat is decorated with feathers at the back, usually the half of a black-cock's tail. Every man and boy, we are told in the guide-books, smokes, and we must never expect to meet one without his porcelain pipe and a red or blue umbrella, which the women also carry as universally. The girls wear a little jaunty cap, or a leghorn hat with an immense brim, and dresses generally dark, and nearly always short; and while some of the costumes appear very coquettish, others are stiff and formal, and some have even a classical correctness. In one of the neighborhoods of the Ziller thal, the women wear

TYROLESE WOMAN.

thick gold or silver tassels lying on the front part of their hat brims, and carry a carnation or other bright flower over the ear. Even travelers catch the mania for picturesque costumes; and, says Mr. Waring, "it is especially pleasing to see a staid, smooth-shaven Englishman, who at home would reprehend the wearing of any thing less than a stiff hat, unbend his rigid lines, deck himself with light and rolling felt, and sport a cock-feather or a bunch of Edelweiss at his crown. It is good, too, to see his sidelong glance at the mirror, and the little wreath of pleasure that winds about his lips at the thought of such rare indulgence."

The peasants pursue their hard husbandry on the richer lands, far up the mountain valleys, wholly regardless of danger. Grohman, in his "Tyrol and the Tyrolese," speaks of houses in the North Tyrol which are built on such steep slopes that they have to be chained to the rocks; of villages where the people go to church with crampoons on their feet to keep from slipping down the hills; and of one village—Moos—of eight hundred inhabitants, where more than three hundred men and women have been killed since 1758 by falls from the steep slopes of the pastures. Mr. Waring relates that on the day that he reached Cortina, in the Dolomites, a mother and her daughter and a young man were working in a hay-field in the neighborhood which slopes down to a high precipice, when the mother slipped, but was stopped by an obstruction. The young man had got down to her and was about to save her, when the child fell and carried them all over the fatal brink. The people have their rough sports, among which are wrestling and finger-hacking, or hooking the middle fingers of two persons together and twisting for a test of endurance at the peril of the joint; and their music, with its characteristic airs, and the national instrument, the bewitching zither. An innkeeper at Fügen, in the Ziller thal—Samuel Margreiter, of the Gasthaus zum Stern—will be associated with pleasant memories to those who were the concert-goers of the last generation. He and his wife were members of Ludwig Rainer's family of Tyrolese minstrels, who charmed English and American audiences with their native airs and manners, and whose pleasant melodies were familiar on all our pianos. He is a handsome, hearty, convivial fellow, and a man of substance, to whom the traveler may be cordially commended, and boasts that he taught the Princess of Wales and the Princess Louise to play on his zillerphone, an instrument with wooden keys like the recently devised metallophone of the toy shops. The people of the Grödner thal have risen to prosperity by their special industry of wood-carving, in which every one engages. Each carver makes one thing, as a donkey or a cat or a soldier, but nothing else, with great skill, and their wares are to be found everywhere. The custom of setting up a cross at every place where a fatal accident has occurred, the use of the cross-form for guide-

posts, and the practice of putting up crucifixes and images of the Virgin for devotion, have filled the land with these symbols, each covered with a roof of boards at the top, and give the scene a religious aspect.

TYROLESE ALPINE GUIDE.

The railroad over the Brenner Pass from Innsbruck to Botzen is one of the most interesting railway routes in Europe. The line, nearly eighty miles long, reaches at its highest summit a point nearly four thousand five hundred feet above the level of the sea, and makes an ascent of nearly twenty-five hundred feet in a distance of a little more than twenty-five miles. It is supported by great embankments and escarpments; and at one point the engineers have turned the little river Sill aside through a tunnel in order to secure a more stable foundation for the road in the old bed of the stream. The road passes through twenty-two tunnels, one of them, near Gossensars, so curved that both its mouths can be seen from the car windows at the same time. The train pursuing the circuitous route through this tun-

nel accomplishes a descent of five hundred feet, when it is brought opposite the starting-point, and only a few hundred yards of direct distance from it. It is the horse-shoe bend of the Pennsylvania railroad made considerably sharper. The scenery grows more grand and wild as the train ascends the northern slope, and many points are brought in sight the historical interest of which varies in date from the time of the Romans to that of Andreas Hofer. On the other side, as the road follows the valley of the Adige, the scenery and the growing crops gradually assume a more southern aspect, until Botzen is reached, with its fields of Indian corn and trellised vineyards, deep in a valley thirty-five hundred feet below the summit of the pass, surrounded by cliffs of red porphyry. Hence we may go, by einspänner or diligence, having the pinnacles of the Rosengarten, one of the most characteristic groups of the Dolomite formation, in sight all the way to Meran, the ancient capital of Tyrol. This is a far-famed health resort, lying in a luxuriant valley at the foot of the mountains, at a pleasant medium between a northern and a southern climate, between the upper and the lower levels. The invalid is chiefly attracted by the grape-cure, but he may take his choice of other cures, as the whey-cure, the cow-milk-cure, the sheep-milk-cure, the water-cure, the pneumatic-cure; and there is room for the well man, too. The banks of the Passier torrent are laid out as a park for guests, with a Winter promenade and sheltered basking-places on the sunny side, and cool retreats and rustic seats by the rapids on the shady side for a Summer promenade. All guests are expected to pay a weekly fee for the support of the Kursaal reading-room, brass band, etc.

A prominent point of interest is the old Schloss Tirol, the former residence of the princes of the land, which gave its name to the country. It stands on the spur of the mountain, twelve hundred feet above the town, and commands beautiful and varied views up and down the Adige, in which "the whole transition from the warm and fertile plains of the south to the dead region of eternal snow is crossed by a mere turning of the eyes from left to right." The valleys are gardens of grapes and grain crops. The land is owned by the thrifty tillers, and the vines, grown on trellises, as in the Lombard plains, give a home-like charm to the landscape. Plentiful crops of all kinds are secured by means of a bountiful irrigation, and the fourth and even a fifth crop of hay of respectable yield is sometimes spoken of. "If I had learned no other lesson from my journey," says Mr. Waring, "I should be amply repaid by the realization it has given me of the great importance of irrigation, on the small scale as well as on the large; of the almost universal ability to make use of it in one way or another; and of the extreme cheapness and simplicity of its methods."

In the deep valleys of South-eastern Tyrol, in the Grödner thal and the system of which the Puster thal is the center, dwell curious mixed stocks of people who may have been descended from the refugees stranded in these recesses after the earlier incursions of the barbarians against the Romans, inheriting their peculiarities from former times. They have their own dialects of barbarous Latin speech intermixed with German and Italian and Spanish words, that have drifted in, which they cherish fondly. They have not been isolated during all this time, for they have sent out their adventurers and their Alpine wares every-where, and are genuine Tyrolese, peculiar communities within a peculiar nation; but contact with the world has had no permanent effect on them. At Diestenheim, in a fine old chateau, at the mouth of the Tanfer's thal, was for years the Summer home of that pair of most home-like English authors, William and Mary Howitt. Mr. Waring, recording the impression left by the visit he paid to them, says that "One gets from an hour passed with them an insight into the happy possibilities of a ripe old age, and looks forward with a fresh interest to the time when one's own long down-hill of life shall bring good and sweet reward for the work of the busier years." William Howitt has since died, but his memory and his books will live long to cheer lovers of home. The Puste-

LEINZ, PUSTER THAL.

thal ends charmingly in a broad and fertile plain at Lienz, a lovely pastoral village dominated by mountains, at the entrance to the wild pass of Heiligenblut, where the priests keep a miracle, and at the foot of the ascent to the Franz Joseph höhe and the Gross Glockner, lord of the Tyrolean peaks.

The dominant feature of South-eastern Tyrol is the range of the Dolomites, lofty mountains with peaks of strange forms, castellated, buttressed, needle, and bayonet shaped pinnacles, "full of sharp angles, fantastic serrations, and knife-like edges." Similar forms are seen in the calcareous mountains as far down as the plain of Venetia and Lombardy, and at Lugano they are conspicuous in the Pyrenees, and are a frequent accompaniment of limestone ranges the world over, but "only here in Tyrol have they their full characteristic effect." The central resort of the Dolomite region is at Cortina, a pleasant town situated at the foot of the great Mount Tofana, in a broad valley four thousand feet above the sea, having a delicious climate free from the chills of some other mountain stations and from the heat of more inclosed valleys. Near the village of Caprile, another resort, is the lake of Alleghe, which was formed in 1771 by a land-slide that buried two villages in the dead of the night and drowned two others by the sudden damming of the river. Another slide, a few months later, raised the waters away up the shore and caused a still greater destruction of property.

The Dolomites are named after Dolomieu,

a French geologist of the last century, who first described the mineral Dolomite, a magnesian limestone, of which they are composed. Baron Richtofen believes that they are the work of coral polyps, and were formed in the bed of a deep salt sea, and raised by slow upheaval to their present elevation. He supports his theory by adducing the correspondence of their forms and surroundings with what is known concerning the coral reefs of the Pacific, the isolation of their masses from other corresponding formations, and a number of circumstances in their shape, situation, and surroundings which make it improbable that they were carved out, like most other mountains, by erosive or atmospheric action.

From Piere di Cadere, the birthplace of the great artist, Titian, is a day's drive by einspänner down a descent of nearly three thousand feet upon a stupendous mountain highway and across the plains to Venice. "The road now clung to the hill-sides, now zigzagged back and forth down the hill-side, or drove far up into a valley," and "often showed as a broad, white band far below us, and often as a terrace borne upon strong arches above us." The course lies down the valley of the Piave, a swift-flowing stream, whose lumber driving and frequent sawmills employ many men, while the constant rectification of the course of the river and the maintenance of the frequent shoots through which the logs are driven occupy women with carrying stones in baskets at their backs. "Despite their hard life, they seem cheerful and careless and happy."

By rail from Venice to high-walled, deep-blue Lake Garda. This is the largest of the Italian lakes, and stretching from the plain of Lombardy into the heart of Austrian Tyrol, it derives interest along every mile of its journey from the villages, monasteries, chapels, and chestnut-groves which its shores reveal. The Ponale road clings to the overhanging precipices on its margin, and "is threaded through tunnels like a string through its beads," and in more than one place a stone dropped from its parapet falls yards out into the water, while the rock above overhangs the head. Some of the villages of the lake stand on precipices apparently a thousand feet above the water, and one of them, Tremosine, a place of some importance, has no other means of communication than by a zigzag path which leads up the almost vertical rock from the steamboat landing.

The cultivable parts of the shore are occupied with gardens of lemons. These gardens are provided, for the protection of the trees in Winter, with tall, brick columns supporting a frame-work on which an inclosure of boards and glass can be made. They are so extensive and the pillars are so numerous in some places that a peculiar effect is given to the appearance of the shore as if it were marked by stages of basaltic pillars rising one above and behind another. Lake Como, the pet of poets and artists, has borne a reputation from ancient times as the most beautiful sheet of water, and still greets the visitor at every turn with "such wealth of beauty, of situation, of vegetation, and of scrupulous horticulture" as he had never conceived, and provokes him to commend it as "the best representation of veritable fairy-land."

On the approach to Milan from Lago Maggiore, an unusually clear day gave full view to "one of the world's most majestic sights," taking in at one sweep the Venetian Alps, the Carinthian range, "the great Dolomites, the Gross Glockner, the Vertel, the entire range of Swiss peaks to Mont Blanc, with seven-peaked Monte Rosa in the foreground, the Cottian Alps, with their pyramidal Monte Viso, the Maritime Alps, the Apennines, and the Euganean Hills," closing almost the entire horizon with the grandest mountain chain of Europe.

Our journey may fittingly close with a visit to some of the Waldensian parishes, where a people of the most rigid Presbyterian orthodoxy practice the severest frugality, "with a calmness and serenity that betokens an aim of life far other than physical improvement;" where "cultivated, enthusiastic, happy men and women, eager in the great pursuit of their lives, practice the genial graces of refined society, and exert a wide-spread influence, which is powerful even

THE WILDE KAISER.

against that of Rome, amidst an almost entire absence of the advantages which come of wealth, and which are so often regarded as indispensable." The pastor at Angrogna gets but little from his people, for they are all poor; he has only a small allowance from the synod, and the pressure of his pastoral duties does not permit him to earn any thing outside. A thin, simple wine, bread, cheese, boiled chestnuts, pototoes, and salad, with usually, but not always, meat on Sundays, are the best he has for his family and guests. "His parish reaches for miles back on the mountains and far up into steep and rugged valleys. Foot-paths and bridle-paths offer the only means of communication, and he is liable, day and night, Winter and Summer, in good weather and bad, to be summoned forth for a long, hard tramp to the house of a sick or dying parishioner. All this he describes as merely incident to a life of necessary and useful service, in which he is contented and happy." It is a wonder how the people live at all, their mountain soil is so poor, their climate and work is so hard; yet they have fought the battles of religious liberty for centuries, and have resisted the strongest assaults of papal force and craft—one of the noblest bands of religionists of whom history has a record. At a Sunday service at Bobe, in the Pellice Valley, one of the famous places in Waldensian history, "the temple was a bare room, with unpainted pulpit and benches, where the women sat in one place and the men in another. The women wore a costume of which a white cap with wide double-fluted ruffles was a conspicuous part, the young girls—those who had not been confirmed—wearing black caps instead. The men were men whom I had known in my childhood in the orthodox Churches of Western Connecticut, smooth shaven—for Sundays—wrinkled, uncompromising countrymen. The older men generally wore blue jeans dress coats with metal buttons and high collars. When the Psalms were given out they took loud-clasping iron cases from their pockets, and put on their steel-bowed spectacles. . . . It was like sitting again among the hard-handed farmers who used to throng the old Congregational Church in New Canaan." The reading-service and singing were also like those of old-fashioned times in New England; and after the services the people lingered around the church soberly to greet each other, just as our country people do.

We are brought home again, even while we are still in the valleys of Piedmont, and among a people whose language is French.

BEETHOVEN—A SKETCH.

THE name of Beethoven is familiar to every lover of classical music. His wonderful compositions are the delight of every cultivated ear. Yet he whose mission it was to afford refined pleasure to millions lived a life which was little else than a romantic tragedy, begun amidst the most sparkling illusions of hope, and ended in the thick darkness of passionate misery.

LUDWIG VAN BEETHOVEN was born at Bonn, on the 17th of December, 1770. His father and grandfather were musicians, and very naturally he was reared amidst musical associations. Though he enjoyed the advantage of a public school and of an early acquaintance with German literature, yet his education was more musical than literary. His wonderful abilities were so highly appreciated by Count Von Waldstein that he prevailed on the Elector Max Franz to appoint him organist to the electoral chapel, when he was only fifteen years old. Shortly after he began to display his extraordinary talents by composing his first sonatas, which caused him to be much admired, too much flattered, and which won him many valuable friends. The seven years, from 1785 to 1792, formed the "happiest portion of his life." He was generously patronized in court circles, moved in the best society, and was especially benefited by the friendship of a highly cultivated family named Breuning, the members of which were "his guardian angels." Nevertheless, his happiness had these drawbacks, his father's life was discreditable, and his own popularity led him to form friendships which wasted his time, and gave him such an inordinate love of flattery as rendered him impatient under the lash of even friendly criticism.

When twenty-two the went to Vienna, which was at that period "the central point of every thing great and sublime that music had till then achieved on the soil of Germany." His object in going thither was to put himself under the tuition of the renowned Haydn, who speedily perceived that Beethoven was no ordinary pupil, and

prophetically exclaimed, after listening to his extemporized performance on a given theme,

"This youth will some day make a noise in the world!"

This prediction was speedily fulfilled. The aspiring composer at once attracted the attention of a distinguished physician and patron of the musical art, named Van Swietan, and of a powerful nobleman named Prince Karl Von Lichnowsky. The latter pensioned him and, with his family treated him so kindly, that the capricious artist speaking of them at a later period facetiously said:

"They would have brought me up with grandmotherly fondness, which was carried to such a length that very often the princess was on the point of having a glass shade put over me, so that no unworthy person might touch or breathe upon me."

Aided by such patronage, by the instruction of such artists as Haydn, Schenk, and Albrechtsberger, and by daily contact with the best musical talent in Vienna, Beethoven's genius soon shone forth with such dazzling spendor that his name became "a general passion, to which every thing gave way." The once obscure boy from Bonn became the "bright particular star" of the musical world in Vienna.

Unfortunately the growth of his eccentricities kept pace with the development of his rare genius, and transformed some of his virtues into great faults. He had, for instance, a profound contempt for rank and wealth in themselves. To him manhood was greater than either, a prince was nothing unless he were "humane and benevolent." He measured men by their minds, not by their rank or possessions. This was right. But when he permitted this feeling to make him rude to his inferiors, disrespectful to his superiors, exacting, sullen, and passionate toward his associates, it became abnormal, offensive to others, and promoted the growth of tendencies in his character which ought to have been eliminated, but which, being cultivated, contributed largely to the misery of his maturer years.

It was a sore trial to England's greatest bard when blindness fell upon him like a thick cloud, but this great artist was stricken by a still greater sorrow. He became *deaf*. At first his hearing was but slightly affected. Unskillful medical treatment aggravated it, and he became so deaf as to be unable to converse, or to hear audible music. To a musical artist what could be a greater affliction? The intensity of his sufferings are expressed with tragical emphasis in a document written by him in 1802, at a time when he supposed himself to be in a dying condition. In this melancholy paper he says:

"I have been attacked by an incurable complaint. . . . I was forced to renounce the diversions of society and to pass my life in seclusion. If I strove at any time to set myself above all this, oh how cruelly was I driven back by the doubly painful experience of my defective hearing. . . . Almost alone in the world, I dare not venture into society more than absolute necessity requires. I am obliged to live as an exile. . . . Though hurried away by my fondness for society, I sometimes suffered myself to be enticed into it. But what a humiliation, when any one standing beside me could hear at a distance a flute . . . I could not hear a sound! Such circumstances brought me to the brink of despair and had well-nigh made me put an end to my life. Nothing but my art held my hand. Ah! it seemed to me impossible to quit the world before I had produced all that I felt myself called to accomplish. And so I endured this wretched life, so truly wretched. . . . O God, thou lookest down upon my misery, thou knowest that it is accompanied with love of my fellow-creatures and a disposition to do good! . . . O Providence! grant that a day of pure joy may once break for me! How long have I been a stranger to the delightful sound of real joy! When, O God! when can I again feel it in the temple of Nature and of men? Never? Nay, that would be too hard!"

Only one writhing in agony like Laocoon in the deadly embraces of serpents could have written thus. Not that the artist was always in such a melancholy mood. Happily the pleasures which accompany the exercises of creative genius beguiled his

thoughts during the hours he daily devoted to work. Nevertheless, his paroxysms of misery were so very frequent that they covered his life with gloom. It was an exquisite torture ever renewed to be unable to hear the performance of his own music. Unfortunately for himself, Beethoven's cold, deistical creed prevented him from deriving that consolation from the great All-Father which none but they who approach him through the crucified One can receive.

Another evil result of his deafness was that of his being doomed to the solitariness of a bachelor's life. What lady would marry a deaf man? Beethoven's excitability, intensified as it necessarily was by devotion to his art, made it eminently desirable that he should find a wife, whose affectionate attentions would soothe his spirit and put a mild check upon his eccentricities. That he was deeply sensible of this need is evident from the following lines from his pen:

"Love and love alone is capable of giving thee a happier life. O God, let me at length find her—her who may strengthen me in virtue—who may *lawfully* be mine."

Before his deafness had become hopeless he wrote to his friend Wegeler saying, "A dear and charming girl . . . loves me as I do her, and this has brought back some happy moments, the first I have enjoyed these two years; it is the first time I feel that marriage could render me happy. She is not, unfortunately, of my station in life, and at present I *could* not marry, for I must be tossed about the world first."

Like all poetical natures Beethoven was very susceptible to the influence of beauty. The attentions of a lovely woman threw him into raptures. Moving as he did in the highest circles, and honored as he was for his masterly productions, he was constantly brought into association with the most attractive women in Vienna. He was, indeed, exposed to "manifest seductions;" but, "like the demi-god of old, he had the firmness to preserve his virtue unscathed." Still he was constantly in love, or fancied himself to be so, with some one or other high-born maiden. Under the inspiration of these short-lived and sentimental, but honorable, attachments he wrote the most tender and charming portions of his music. The expression of his passion in music often exhausted its power and left his heart free to submit to the attractions of some new charmer. These purely poetical phases of feeling did not leave any scars either in his inamorata or himself.

But to one lady, named Julia, he seems to have been profoundly attached. Certainly his correspondence with her was Werther-like in expression, and from his allusions to her in after life, his love for her appears to have been both deep and lasting. He addresses her with such genuine German extravagance as "My angel, my all, my other self! . . . Can our love subsist otherwise than by sacrifices, by not wishing for every thing? Canst thou help it that thou art not wholly mine, that I am not wholly thine? . . . Love requires every thing, and very justly. So it is I with thee, thou with me: only thou forgottest so easily that I must live for myself and for thee. . . . Love me as thou wilt, my love for thee is more ardent—but never disguise thyself from me. . . . Is not our love a heavenly structure; but firm as the vault of heaven? . . . Never can another possess my heart—never! never! . . . The life that I am leading at present is a miserable life; thy love makes me the happiest and at the same time the unhappiest of men. At my years I need some uniformity, some equality in my way of life. Can this be our mutual situation? Be easy; it is only by tranquil contemplation of our existence that we can accomplish our object of living together. What longing with tears after this, my life, my all! Farewell. O continue to love me, and never misdoubt the most faithful heart of thy BELOVED LUDWIG."

This is rhapsodical enough to please even an admirer of Klopstock or Goethe. Of course such sentimental nonsense, however wise and precious it may have appeared to the artist and his Julia, *reads* very flat, and should by no means be accepted as model love-letter writing by any youth or maiden who may chance to read it. Generally such sentiment as the above is but the froth of

fancy, not the coinage of true and reasonable affection. But Beethoven was a poet by nature. No doubt he meant what he wrote, at least, while he was penning it. His biographer thinks his love for Julia was genuine and would have culminated in marriage but for his unfortunate deafness. Whether Julia finally refused him on that account, or whether he declined to impose himself upon her, is unknown. It is only certain that he did not wed her. Misery, not Julia, or any other maiden, became his bride.

Disappointed with respect to his desire for marriage, vexed by envious brother artists, excited by his evil-minded brothers to distrust his friends, tortured by the ingratitude of a nephew whom he adopted as a son, annoyed by his incurable deafness, nervously irritated by the absorbing study his professional duties demanded, his life became a prolonged discord. The musical world went into ecstasies while listening to his wonderful overtures, symphonies, sonatas, and songs; vast audiences shouted loud applause when he appeared on the stage after the performance of his glorious music; his name was honored both in his own and foreign lands. Yet he who combined the sounds which gave delight to countless thousands could hear neither his own wondrous music nor the voices which thundered the popular applause. What was fame to such a man? It could not calm his restless spirit nor keep him from that constant self-irritation which was perpetual misery. He was a magician with power to give to others pleasures which a cruel fate forbade him to taste himself. Unhappy Beethoven!

As might be expected under these circumstances the artist's temper became very inflammable. The following incident is characteristic. He was dining at a hotel one day, when the waiter brought him the wrong dish. When reproved for his mistake the fellow answered impertinently. Beethoven, in a furious passion, instantly seized the dish of stewed beef and threw it at the waiter's head. The man's arms were filled with plates containing numerous viands, so that he could not move them. There he stood with the plenteous gravy trickling down his face, swearing and shouting at the equally enraged artist. The company in the room roared with laughter. Beethoven's passion cooled when he noticed the ludicrous aspect of the waiter, whose words were soon choked by the stream of gravy, which he vainly endeavored to lick in with his tongue. In doing this he made so many absurd grimaces that the artist's sense of the ridiculous was titillated, and he finally joined in the uproarious laughter of the guests.

These fits of violent anger were quite frequent, and often led to similar unpleasant scenes, which did not always terminate so pleasantly as this one. In fact, in hotels where he was well known no notice was taken of his outbreaks. They were looked upon as the eccentricities of a great man, and were not resented as perhaps they deserved.

The reader will be pleased with a graphic sketch of the great man's appearance a few years before his death. It is taken from Russell's "Tour in Germany." Mr. Russell says:

"Though not an old man, Beethoven is lost to society in consequence of his extreme deafness, which has rendered him almost unsocial. The neglect of his person which he exhibits gives him a somewhat wild appearance. His features are strong and prominent; his eye is full of rude energy; his hair, which neither comb nor scissors seem to have visited for years, overshadows his broad brow in a quantity and confusion to which only the snakes round a Gorgon's head offer a parallel. His general behavior does not ill accord with this unpromising exterior. Except when he is among his chosen friends, kindliness or affability are not his characteristics. The total loss of hearing has deprived him of all the pleasure society can give, and perhaps soured his temper."

Beethoven died, after three months of severe suffering from dropsy, on the 26th of March, 1827, in the fifty-seventh year of his age. He met his end, not with the calm peace or heavenly joy of the Christian, but with the Socratic courage of a deist. The consolations of the *Christian* faith were unknown to this wonderful but unhappy man. He was buried at Vienna with much pomp,

and twenty thousand souls witnessed the imposing ceremonies.

Competent critics place him in the foremost rank of musical composers. What Dante was in poetry he was in music. His works are original, powerful, full of inspiration, wild in their energy, but "relieved by frequent touches of tender beauty and melancholy." He is a marvelous example of the mind's independence of its material organs. Deprived of the ability to *hear* a note he nevertheless *mentally* conceived some of the loftiest and sweetest strains that ever gave delight to the outward sense of hearing. So clearly defined were those mental conceptions that he was able to give them written expression. His was, therefore, the music of the soul, felt as disembodied spirits feel the melodies of music. And it must be accepted as one proof of the spirituality of man, of his capacity to think and feel independently of those bodily organs which he "shuffles off" when he reaches that bourne which must be crossed, but can not be recrossed.

THE BLACK DEATH.

IN the whole history of medicine there is no more awful and mysterious chapter than that which is concerned with the ravages of the black death in the fourteenth century. The narratives of other dreadful pestilences are more familiar to the public, because those narratives have been told by great masters of literary art, whose works are held by the world in lasting admiration. There appears, however, to be no doubt that the black death has a horrible preeminence above every other scourge of this character, for it raged throughout the whole known world, and with an intensity to which there is no parallel. In many respects it corresponds with the plague which to a certain extent is endemic in some Eastern localities, and also to that form of it which excited so much alarm last year in its threatened progress through Russia westward. We will examine this curious subject of mediæval history with especial reference to the modern aspect of the subject. It is a remarkable fact that the regular historians of England have attended so little to its social history that Hume dismisses the subject in half a page. Dr. Lingard, and Mr. Green in his "History of the English People," enter more largely into the subject.

Of course, we first turn to our modern medical lights to see what they can tell us of the plague. We turn, for instance, to Sir Thomas Watson, who has been called the Cicero of English medical literature. Sir Thomas, however, does not help us very greatly. "Concerning the plague," he writes, "as I have never seen, and hope never to see it, and as with Cullen I 'think it unfit for a person who has never seen the disease to attempt its peculiar history,' I shall not presume to offer you any observations in detail." Other doctors—we may name Dr. Milray and Dr. Aitken—do, however, go considerably into detail. We do not find it specifically described as that great pestilence known as the black death, but the black death is included under the general title of the plague. The doctors naturally take the plague in its present existent epidemic form, and, like the historians, hardly note the great scourge of the fourteenth century. Of course, they refer to those earlier writers, Mede and Sydenham, who have described it as it was in or near their own days. Sir B. Faulkner was resident in Malta when the plague raged there in 1813, and of twenty-eight inmates of the lazaretto all perished within a very few hours. It is probable that the black death did not materially vary in type from the present well-defined plague, although from time to time there have been jail or hospital fevers, typhus or typhoid, which have closely simulated it. Physical and moral wretchedness are invariable elements, and especially a collection of human beings in cellars or on ground-floors. "The plague," says one of the doctors, "was a

disease which seldom went up-stairs." The French writer Volney says: "The Winter stops the plague at Constantinople because the cold is great, and the Summer lights it up because the heat is then humid, while in Egypt the Winter favors it because the climate is then warm and moist, and the Summer stops it because it is hot and dry. The heat is only injurious when associated with humidity." When Lady Ann Blunt was in Bagdad lately she obtained some interesting particulars respecting the plague from a resident English physician. It exists perennially in Bagdad, much as the small-pox does in London. It is especially found in dirty, over-crowded tenements. It is not communicated by the air, neither is it caught by brushing up against infected people in the streets. It is noticeable that the Jews in the towns especially suffer from it, while the Bedouins of the desert are altogether exempt. The plague commences with a little fever, which continues for a couple of days, accompanied by a glandular swelling on the groin or armpit. If the swelling suppurates the patient recovers; if not, there is fever, delirium, and collapse. In Bagdad it has been a veritable black death. It is said that when the plague broke out in 1774 the deaths in the city and the province amounted to five millions. Bagdad never got over the plague. Its population has never since that time exceeded a hundred and fifty thousand. Since that time the plague seems to have made its appearance about once in a generation. About a hundred thousand persons perished in 1831. Just as the plague broke out in the last Russian war, so in the previous war between the Russians and the Turks it raged in the Danubian principalities.

The disease which is most distinctively known as the black death is the great pestilence of the fourteenth century. For the best and, indeed, for the only systematic account of this pestilence we are indebted to the distinguished German writer and physician, Dr. Hacker. No other plague ever fell with such desolating force upon the world. The figures of the Great Plague of London are as nothing in proportion to the most authentic calculations that can be made respecting this plague. In Italy one-half of the population died. In Avignon the pope consecrated the river Rhone, that bodies might be thrown into the river without delay, as the church-yards would no longer hold them. In England the black death prevailed for a whole year, being much longer than its average duration. The fullest account of the pestilence in England is to be found in Dr. Barnes's Cambridge folio of the "History of Edward III," which the erudite doctor compiled from every attainable authority on the subject. The plague first broke out in Dorsetshire, and then marched through the counties of Devon and Somerset, and so reached Oxford and London. The enormous statement is made that nine-tenths of the people died. Mr. Green puts the mortality at one-half. In London the grave-yards altogether failed to furnish room for the dead. "We find," says Barnes, "that the noble and valiant Lord William Manny, having a pious regard to God's judgments and the common frailties of humane nature, purchased a piece of ground adjoining to a place called 'No Man's Land,' and caused the same to be inclosed and consecrated, in which one place (besides those buried in other church-yards, churches, and monasteries) there were buried within one year more than fifty thousand persons. Wherefore the said noble Lord William Manny, in memory of the vast numbers of Christian persons there buried, and in pious charity (as he thought to their souls), caused afterwards, on the same ground, a chappell to be built of rare workmanship." Subsequently, however, he changed his mind, and founded a monastery of Carthusian monks; "but now it is an hospital for poor men and children, of the foundation of the worthy Thomas Sutton, Esq., while called by corruption the Charter House." Parliament did not sit for two years. For two years also the Court of the King's Bench was closed. The plague extended to Wales, and thence to Ireland; but it curiously happened that, while the English in Ireland were attacked, the native Irish suffered very slightly. There was a

considerable amount of exultation in Scotland at the heavy misfortunes which had assailed their southern neighbors. They chose this moment of horror and necessity to make an invasion of the northern borders. The black death fell upon them, destroying at once five thousand men, and they took the disease with them into Scotland. Then the disease, or something very similar, fell upon the cattle. "For want of men to look to them the cattle wandered about in the fields at random, from whence nobody drove or gathered them. So that they began to perish among hedges and ditches in such numbers that it was no less than wonder to behold; and there died in and about our pasture more than five thousand sheep. No bird or beast of prey would touch the carcase." In many places the harvest was not gathered in through want of laborers. In other places the most exorbitant price was charged for labor. The landed proprietors were obliged to renounce their claim for rent, and the lords of manors their claims for service. The black death struck at the whole social life and all the institutions of the country.

A curious fact is that there was an assemblage of cosmical physical facts which happened at the time of the black death. Dr. Hacker considers that they must be associated as cause and effect, but he has not succeeded in demonstrating the correctness of his theories, and we can hardly see how they rest on any scientific basis. It so happened that on March 24, 1345, there was a conjunction of the planets Saturn, Jupiter, and Mars in the sign Aquarius, and this malevolent combination was generally assigned as the cause of the black death. There was a combination of five planets this present Summer, but the modern Zeitgeist knows nothing of such credulity. It was noticed that there had been incessant rain in England for six months. Before the visitation there were great atmospheric disturbances. A thick stinking mist came up over Rome and Vienna. There was a fiery star over Paris, just as Josephus tells us that one blazed in the form of a spear during the last days of Jerusalem. Honest Barnes, following Stow, relates: "In the County of Oxford, nigh Chipping Norton, was found about this time, a monstrous serpent having two heads, with faces of women, one being shaped so as to resemble the new type of those days, and the other to represent the old antiquated fashion; it had also large and great wings, but something like those of the flitter mouse or bat, as authors have reported." In many parts of the country, at different times, there was an abnormal shake as frequent as a sea-swell. Divines of the time considered that the plague was a visitation on account of the pride and luxury of the ladies in dress and ornament, and contrasted their attire with the quaint simplicity of their ancestors. Without question there seems to have been an extraordinary amount of physical phenomena, but much legendary matter is mixed up with authentic tradition, and it is too late to attach any precise scientific value to the great mass of information that has come down to us.

The symptoms of this extraordinary disease, so far as they have been detailed, greatly resemble those of the Asiatic plague which caused so much alarm last year, and in some measure correspond with those of the common plague; but also presented some features peculiar to itself. Sometimes there was an assemblage of symptoms, at another a single one sufficed to do the deathly work. The boils or tumors of the true Eastern plague were often present, together with the black tongue or black spots over the body, which gave the name of the black death. Bleeding of the nose, or a spitting of blood, was one of the worst symptoms. Inflammation of the lungs was a very frequent accompaniment. The disease ran a very rapid course, being generally fatal on the second, or, at the latest, on the third day. After the black death had exhibited its abnormal symptoms with the utmost fury for a space, the pestilence generally subsided into the usual febrile form of the common plague. It rarely exceeded a certain number of days in the individual or months in the locality.

If we look at the medical treatment of the times, amid much that is absurd there is also much that is accepted now as the true

method of treatment. The effort was made to stamp out the mischief. The Venetians established lazarettoes on islands some distance from the city. Quarantine, meaning forty days' detention, came into vogue. This exact term was fixed because the fortieth was thought to be the last in cases of ardent disease. The secret of stamping out disease was not unknown in the Middle Ages. It had been practiced, indeed, by the physicians of the second century, in order to prevent the spread of leprosy. But in those times there seems to have been a reckless disregard of human life, and men cared more for property than person. This is the mistake that long remained in the English penal code, and is hardly yet exterminated at the present time. In the case of murrain among cattle there was a careful separation of the diseased from the healthy, but this method for the public protection of the human subject was not resorted to. Pope Clement VI was advised to shut himself up at Avignon while the plague lasted; he did so, and escaped. It is greatly to his credit that he took the greatest care of the people of Avignon, by supplying them with food and medicines. Dr. Hacker gives an account of the treatment pursued: bleeding, aperients, incisions of inflammatory boils, which saved many lives. He considers that a learned physician of Padua, Galeazzo di Santa Sofia, had to a very considerable extent explored the nature of the plague, and discovered a rational and successful mode of treatment.

What may be called the moral history of the black death is painfully and intensely interesting,, but at the same time repulsive and humiliating in many respects. Several accounts of the plague have come down to us by writers of a very high order of literary genius, and they exhibit a common likeness. Such accounts have been given by Thucydides, Boccaccio, and De Foe. The account of the plague of Athens, written by the great Athenian historian, is remarkable for its graphic accuracy and power. It almost seems that at such a time good men become better, and bad men become worse than ever. The Greek historian notices that there were many noble-minded persons who were unsparing of themselves in visiting the sick, though at the imminent risk of contagion, and those who had recovered, and had no fear of falling ill a second time, were especially pitiful towards the sick and dying. But to a much greater extent the narrative is very sad. For the most part, in the face of this great calamity, all divine and human ties were loosened. "So they resolved to take their enjoyment quickly, and with a sole view to gratification, regarding their lives and their riches alike as things of a day. As for taking trouble about what was thought honorable, no one was forward to do it; deeming it uncertain whether before he had attained to it he would not be cut off; but every thing that was immediately pleasant, and that which was conducive to it by any means whatever, this was laid down to be both honorable and expedient. And fear of gods or law of man there was none to stop them." Very much to the same effect is the language of Boccaccio. It will be remembered that the stories of the Decameron were told by a number of ladies who retired from the plague-stricken city of Florence to a delightful villa, in whose gardens they tell each other pleasant, but not over-edifying stories. Boccaccio says that at Florence every feeling of humanity became deadened. Some fled the place altogether, others shut themselves up, and the rich made a rule of only partaking of the very best food, and of that in the greatest moderation. "Others, on the contrary, considered eating and drinking to excess, amusements of all description, the indulgence of every gratification, and an indifference to what was passing around them as the best medicine, and acted accordingly. They wandered day and night from one tavern to another, and feasted without moderation or bounds." A horribly grotesque feature of misery was added. Laughter and mirth were considered as preventives of disease. A ghostly merriment reigned in the midst of horrors. Persons also might be seen walking about the streets carrying odoriferous flowers, herbs, and spices, which they smelled frequently, under the idea of invigorating the brain and dispelling what

might be noxious in the air. All natural ties seemed broken up. Even the wife fled from the husband, the sister from the brother. Boccaccio's picture is drawn in the darkest colors; but a contemporary gives the highest character to the charitable and religious orders. He says that they showed admirable courage and compassion amid all the baseness of the times. Boccaccio said that he observed animals fall dead after touching rags belonging to diseased or deceased persons. The third great work on plagues is "Daniel De Foe's History of the Plague in London." Sir Walter Scott truly says that "had he not been the author of 'Robinson Crusoe,' De Foe would have deserved immortality for the genius which he has displayed in this work." There may be a good deal of romance in it, but it is often that kind of romance which is often better than history, where a vivid realization of things comes home more truly to the mind through the inspiration of genius than through any amount of labor of the dry-as-dust order.

There is a peculiar page in the history of the plague which presents a few eminently pleasing features amid the gloom which inseparably belongs to the subject. The village of Eyam (pronounced Eem), in Derbyshire, was virulently attacked by the epidemic in 1665. The infection was supposed to be conveyed by opening an infected bale of goods. The parish clergyman determined to follow out the only plan which seems to have any decisive effect, that of drawing a cordon round the place, and so stamping out the complaint. Mr. Mompessor persuaded his parishioners to lay down a rigid boundary beyond which none of them should pass. Troughs were erected, fed by a running stream near which provisions and supplies were deposited, and money placed in return in the disinfected water. Mompessor also closed the church, and held divine service in a natural opening in the rocks of a ravine. Mompessor's Well is still shown to tourists in Derbyshire, and the cavern where he preached. On the hill-side various tombs are still to be seen of those who were buried at this unhappy time. This state of isolation existed more than a year. Most of the parishioners died, and the vicar lost his own wife. He had entreated her to leave the place when the plague broke out, but she thought it her duty to stay with her husband and his people. In the Seward Anecdotes there are some interesting letters preserved of this worthy man. He tells his patron of the loss of his wife, and of his firm belief that he himself was on the eve of dying. "The destroying angel having taken up his quarters within my habitation, my dearest dear has gone to her eternal rest, and is invested with a crown of righteousness, having made a happy end. Sir, this paper is to bid you a hearty farewell forever, and bring you my humble thanks for all your noble favors, and I hope that you will believe a dying man. I desire, sir, that you will please make choice of a humble, pious man to succeed me in my parsonage, and could I see your face before my departure from here I would inform you which way I think he might live comfortably among his people." It is gratifying to know that the good man did not die, but lived to be promoted to another living four years later; but the new parishioners refused to receive him, as they thought he might have the taint of the plague about him, and so they built him a hut in Rufford Park, where he dwelt till their nervousness went off.

One of the worst features presented by the history of the black death was the fierce prosecution aroused against the Jews. This unhappy race had always been persecuted, but the persecution arose to a perfect frenzy at the time of the black death. They were accused of infecting the air and poisoning the water. So thoroughly was this absurd accusation believed that in many places the springs and wells were built over, and the people only drank river and rain water. At Basle all the Jews were shut up in a wooden structure, and they were all consumed together. At Strasburg two thousand Jews were burnt on their own burial-ground. It is said that at Mayence twelve thousand Jews were put to death. Those who were not burnt to death were banished,

and too often, when wandering about, were put to fire and sword by the ignorant people. Under the influence of excruciating torture some poor Jews acknowledged themselves guilty, just as some poor old women under the pressure of intolerable suffering have owned themselves witches. The Jews were often driven to despair. At Spires they set fire to their own habitations, and consumed themselves, their families, and their treasure. At another place they burned themselves within the synagogue, and mothers threw their children into the flames. Even if the Jews recanted they were sure ultimately to be put to death, and the few Christians who ventured to sympathize with them were put on the rack and punished at the same time. Nothing proves the savagery of this persecution more than the fact that the pope and emperor were fairly convinced of the innocence of the Jews, but found themselves powerless to restrain the madness of the people. The idea was that the Jews received poison by sea from remote parts, and also prepared it themselves from spiders, owls, and venomous animals. George Eliot, in her "Impressions of Theophrastus Such," seems to have had these sufferings in mind. "As the slave-holders of the United States counted the curse of Ham a justification of negro slavery, so the curse on the Jews was counted a justification for hindering them from pursuing agriculture and handicrafts; for marking them out as execrable figures by a peculiar dress; for torturing them to make them part with their gains, or for more gratuitously spitting on them and pelting them; for taking it as certain that they killed and ate babies, poisoned the wells, and took pains to spread the plague; for putting it to them whether they would be baptized or burned, and not failing to burn and massacre them when they were obstinate; but also for suspecting them of disliking the baptism when they had got it, and then burning them in punishment of their insincerity; by all this to avenge the Savior of mankind, or else to compel these stiff-necked people to acknowledge a Master whose servants showed such beneficial effects of his teaching."

There is one extraordinary chapter in the history of the black death which ought not to be passed over. The Order of Flagellants arose at this time. Penetrated with the belief that their sins had called down the vengeance of heaven, vast processions of penitents passed through the streets, armed with scourges, lashing themselves and each other until the "blood gushed out." They marched with torches and banners, in night, in the Winter, and penetrated into the solitudes of mountain and forest. The penance was repeated twice a day—morning and evening. The greatest enthusiasm was excited on their behalf throughout Germany. It often happened that after they had lashed themselves in the churches, they were entertained in the market-place. A band of Flagellants came over to England, and operated freely on themselves in the streets of London. The practical English mind, however Romish at the time, could not discover the use of such penance, and the Flagellants did not make a single convert.

Let us now look at the question of the plague at the present time. In the whole of Eastern Europe the consternation has of late been extreme—very naturally, and with very good reason. This outbreak of last year was of a most virulent and contagious character, in many particulars closely resembling the black death. It was localized by the stringency of the precautions taken, and perhaps still more by the advance of the cold weather. It has been customary to call this the Siberian plague, and the Russian Medical Service of the Interior for 1877 reports an outbreak of the disorder in various districts of Siberia; but at the same time the plague was found in Persia, and districts far east of Persia. It was thought in 1873 that at that time the plague had long ceased to be endemic in China. Now, accurate examination of facts has elicited that for many years it had been raging in Eastern districts, and was supposed to have been introduced from Burmah. But the fact is, that there is so little facility of communication existing in Central Asia that the plague may be ravaging one region and the fact may not be known in other regions not so very far away.

And, of course, it would be still less known in Europe. It was especially present in the Chinese province of Yunnan, in the time of the rebellion—in fact the rebellion and the plague broke out together. It especially spread, owing to the superstitious practice of not burying the dead until the remains, exposed on a bier to the sun, are completely decomposed. In 1871 to 1873 the plague was very prevalent in Yunnan; in 1873 it suddenly appeared in Mesopotamia, and almost simultaneously in Persia; by 1877 it had spread to the shore of the Caspian Sea. At the end of 1877 an intermittent fever, with glandular swellings—the prevailing symptom of the black death—appeared at Astrachan, which developed into a malignant form of plague. It is a mistake to speak of the plague as proceeding from the Volga or any part of Russia, or, indeed, of Persia; it must be traced back to China, or even Burmah. Every effort has been made by the Western Powers to prevent the importation of goods from the infected districts, and one wise precaution has been to clear the ports of entry from the evil sanitary conditions which would promote the spread of epidemic disease.

Whatever advances medical science may have made, it is still almost as it used to be of yore in grappling with pestilence in its fury; and our best safety lies in understanding and obeying the wise, simple, salutary laws of nature and of health. Through the various modifications of countries and centuries, the main symptoms do not vary of "the pestilence that walketh in darkness;" but we may trust that the advance of medical knowledge, and the better observation of natural laws, will now prevent the appearance of plague in that intensified malignity which marked the black death.

IN THE WHEAT-FIELD.

IN his fields the Master walketh,
In his fair fields ripe for harvest,
Where the golden sun smiles slantwise
On the rich ears, heavy bending;
Saith the Master: "It is time."
Though no leaf wears brown decadence,
And September's nightly frost-blight
Only reddens the horizon,
"It is full time," saith the Master—
The good Master—"It is time."

Lo! he looks. His look compelling,
Brings the laborers to the harvest.
Quick they gather, as in Autumn
Wandering birds in silent eddies
Drop upon the pasture-fields;
White wings have they, and white raiment,
White feet, shod with swift obedience;
Each lays down his golden palm-branch,
And a shining sickle reareth—
"Speak, O Master, is it time?"

O'er the fields the servants hasten,
Where the full-stored ears droop downward,
Humble with their weight of harvest;
Where the empty ears wave upward,
And the gay tares flaunt in rows.
But the sickles, the bright sickles,
Flash new dawn at their appearing;
Songs are heard in earth and heaven;
For the reapers are the angels,
And it is the harvest-time.

O great Master, are thy footsteps
Even now upon the mountains?
Art thou walking in thy wheat-field?
Are the snowy-winged reapers
Gathering in the purple air?
Are thy signs abroad?—the glowing
Of the evening sky, blood-reddened—
And the full ears trodden earthward,
Choked by gaudy tares triumphant—
Surely 't is near harvest-time!

Who shall know the Master's coming?
Whether 't is at morn or sunset,
When night dews weigh down the wheat-ears,
Or while noon rides high in heaven,
Sleeping lies the yellow field?
Only may thy voice, O Master,
Peal above the reapers' chorus
And dull sound of sheaves slow falling:
"Gather all into my garner
For it is my harvest-time!"

HENRY CRABB ROBINSON AND HIS FRIENDS.

HENRY CRABB ROBINSON was born in England in the year 1775 and lived to the extreme age of ninety-two years. He is noted in literature, not for any thing which he did, but for the many literary friends which he formed during his long life. He has left us an account of these friends in the diary which he kept for many years, and in the pleasing "Reminiscences" which he wrote in old age, and much that has value will here be found which the student would fail to find in pretentious histories.

His childhood was an uneventful one. At the age of eighteen years he entered as a clerk in a lawyer's office in the old town of Colchester, which is situated about fifty miles from London, and here he learned the routine work of a lawyer's office. At this time he had an opportunity of hearing two men who were among the most famous in England of that day. He heard Thomas Erskine plead a case, and fifty years later he could distinctly remember the voice and manner of this remarkable man. He was pleading a will case, and spoke in a way which thrilled alike the court and jury, "If, gentlemen, you should by your verdict annihilate an instrument so solemnly formed, I should retire a troubled man from this court." Undoubtedly Erskine was the ablest advocate before a jury that England has ever had. Part of his great fame comes from the trials of Handy and Horne Tooke, who, seeking parliamentary reform, were indicted for high treason. Erskine defended them and won a victory. According to Robinson, Erskine's skill lay in his frequent repetitions. He would repeat the thought several times over, though varied in expression so as not to produce weariness. He was an orator, who knew how to unite courage and caution, how to master his subject in a short time, and how to influence a jury.

In 1790 Robinson heard John Wesley preach. Wesley was now in extreme age, and had won his way to the respect of all England. The account which Robinson gives is interesting, and we quote a few sentences. "He stood in a wide pulpit and on each side of him stood a minister who held him up, having their hands under his armpits. His feeble voice was barely audible, but his reverend countenance, especially his long white locks, formed a picture never to be forgotten. There was a vast crowd of lovers and admirers."

In 1795 Robinson went to Bury. Among the people whose friendship he formed was Catherine Buck, who was like an older sister to him and gave him kindly advice. She became the wife of the celebrated Thomas Clarkson, whose writings and ceaseless efforts led England and other nations to join in efforts for the abolition of the slave-trade. While Wilberforce and Fox deserve credit, yet Clarkson was the pioneer in the movement, which found its fitting culmination in our own day in the abolition of domestic slavery. Robinson was always welcomed at the home of the Clarksons, and concerning Mrs. Clarkson he wrote in after years, "She was the most eloquent woman I have ever known with the exception of Madame De Stael."

He soon drifted to London, and for four years led a somewhat unsettled life. He entered a lawyer's office, not that he had a liking for the profession of law, but because he was ashamed to be idle. He heard with disgust the advice which was given to him by a successful lawyer, "fag, fag, fag." He took lodgings in Drury Lane, practiced economy, and attended those debating clubs which are a feature in London life. In these he attained that art of ready speaking to which he attributed his success in life.

At this time he inherited the sum of a hundred pounds a year. This was not a large sum, but it decided his future for some years, for he was now able to gratify a long cherished desire to go to Germany and study the language and literature of that country, which was now rising into prominence.

In 1800 he left England and went to Frankfort. The quaint old city was in a blaze of excitement, for the army of Napo-

leon was at its gates and soon entered the city. Here Robinson beheld a new form of dancing, called waltzing. He describes it minutely in a letter to a friend in England, and, like Byron, seems to have thought it a somewhat indelicate performance. But fashion seems to have reversed that opinion, if we may judge by the conduct of many respectable people.

He strolled through Dresden and Prague, and came to Weimar where he spent two days, which were to him probably the most interesting in his life. This town in the year 1800 was in itself insignificant, for it had not an object of beauty or taste. But it was the home of the two greatest of German poets—Goethe and Schiller. Robinson called upon these poets. He records that Goethe, who was then fifty-two years of age, was "oppressively handsome," whatever that expression may mean, and Schiller had "a wild expression and a sickly look." The former was at that time the idol of the German literary public. A call was also made upon Wieland, who was then advanced in years, and was to Germany almost what Voltaire was to France. Robinson attended the performance at Weimar of "Wallenstein's Death," where he met again Goethe and Schiller, who were present as managers.

In 1802 he was enrolled as a student in the University of Jena, where he spent three pleasant years listening to the lectures of Voigt on natural philosophy, and Voss, the first of translators from the Greek into German, and Schelling, who, though he had "the countenance of a white negro," was able to give most fascinating lectures on "The Art of the Beautiful." There was a host of literary men then in Germany whose writings have made that time the Augustan age of German history.

At Weimar, Robinson was introduced to the celebrated Madame de Stael. She had incurred the anger of Napoleon, and had thought it prudent to withdraw from France. She spent some time in Weimar with her attendant satellite, Benjamin Constant, the French statesman, and tried to appreciate the beauties of German literature. She was a brilliant talker, and her books on Germany and Italy extended her fame; but neither her conversation nor her manners produced a favorable impression. Robinson, at her request, aided her in the study of the German language.

In 1805 he returned to England, where he spent the rest of his life, with frequent excursions in the Summer vacations to the Continent, going once to Spain, where he acted as reporter to the London *Times* during a part of Wellington's campaign. During the sixty-two years which followed he was on intimate terms with many of his celebrated countrymen. He seems to have led the life of "a busy idle man," as he expresses it. He left the legal profession at the age of fifty-four, and gave himself to literary leisure. As he was a bachelor of economical habits, he was able to live on a small income, and keep an open, generous hand. He was a lover of books, but still more a lover of men. He was a cheerful, genial man to the very last—fond of a long walk, fond of a long talk, and abounding in good spirits and good anecdotes. Perhaps he was better at talking than at listening. He was always a welcome visitor at the houses of his friends, and only death sundered his many friendships. In his seventieth year he was said to be as much a boy as ever, and Wordsworth called him "a healthy creature who talked of coming again in seven years as others would of seven days."

He was on most intimate terms with the "Lake School" of writers. Many an evening he spent with Coleridge and his friends, and listened while Coleridge went on for hours in a marvelous stream of talk about English poetry and Spanish politics and German metaphysics. Sometimes the stream of his conversation was too deep or possibly too muddy for his hearers to see the bottom of it, but it flowed on, and on, and on. His power as a talker was wonderful, and since Samuel Johnson's time there has been nothing like it. He was unrivaled in a monologue, but he had no idea of a dialogue, and his admiring hearers had no desire to interrupt him. Robinson went to hear him give a public lecture on one of Shakespeare's plays, "Romeo and Juliet." Coleridge began with

a plea for flogging in school, denounced the Lancastrian system of instruction, and wandered from one abstruse theme to another, but not a word about the play. When he wandered from the track he seemed to lack the power to bring himself back again.

With Wordsworth, Robinson was most intimate, and accompanied him in a tour through the Swiss Alps. He was a frequent visitor at the house of the poet at Rydal Mount, and acted the part of a friendly and admiring critic. Wordsworth, in the confidence of friendship, spoke of the future of his poems. He knew that there was no money to be gained by their publication, but he cared not for that. No one understood him as yet, not even Coleridge. No one could understand him save he who dwelt apart from the haunts of men and had a mind attuned to nature. He was persuaded, however, that if the day ever came when men should be wiser and better, his poems would then make their way and rise in popularity. Robinson found Wordsworth to be one of the happiest of men. He was, in fact, too great a man to be made miserable by the savage criticisms of the *Edinburgh Review*. With faith in the merits of his poetry, he appealed from the critics of the present to those of the future, and had no fear as to what the verdict would be.

With Southey, Robinson was not so intimate. Southey was poet laureate, and was busy early and late driving his pen and writing volume after volume of excellent prose and moderate poetry. His health failed under his severe application, and Robinson, with two or three other friends, accompanied him in a tour through France. "During our stay in Paris," Robinson writes, "I believe Southey did not once go to the Louvre; he cared for nothing but the old book shops. This is a singular feature in his character. But with this indifference to the living things around him is closely connected his poetic faculty of beholding the absent as if present, and creating a world for himself."

His most intimate friend was dear, gentle, genial Charles Lamb, and many an evening did he spend with Lamb and his sister. It is a pity that more of the pleasant conversations were not recorded. Lamb, though in weak health, was full of humor, and some of the puns and odd quotations which he would innocently stutter were certainly amusing. Thus, concerning a certain person, he said, "He says that he could write like Shakespeare if he had a mind; so you see nothing is wanting but the *mind*."

Robinson was with him when his play, "Mr. H——," was performed and hissed, and Lamb joined in the hissing. It is not always that an author agrees with the unfavorable judgment of the public. Lamb's library according to Robinson, had a remarkably fine collection of shabby books. "Such a number of first-rate works in very bad condition is, I think, nowhere to be found." To the last Lamb was child-like, and he clung to kind friends, good pictures, and choice poetry. The devotion which he showed through many years to his afflicted sister reveals a beautiful trait in his character. It was a sad hour when he died, and the world will not soon behold another such a humorist.

Among Robinson's first acquaintances on returning from Germany to London was Mrs. Barbauld, whom Wordsworth declared to be "the first of our literary women." She was widely known for her "Hymns in Prose;" but her writings are now rarely read. Her longest poem was entitled "1811," because written in that year, and it gives a gloomy view of England's future. It prophesied that "at some future time a traveler from the antipodes will from a broken arch of Blackfriars Bridge contemplate the ruins of St. Paul's." There is no single sentence of Macaulay's which is more frequently quoted and will live longer than that in which he speaks of the time "when some traveler from New Zealand shall, in the midst of a vast solitude, take his stand on a broken arch of London Bridge to sketch the ruins of St. Paul's." The boldness of the imagery struck the popular fancy. The only credit Macaulay deserves for it is the credit of a good memory which enabled him to make an apt quotation.

Robinson was well acquainted with two of the first of English artists, Blake and Flaxman. Blake was both a poet and a designer of

engravings. He was subject to strange religious delusions, but these did not affect his high merits as an artist. His best work was in his later years, when he produced a splendid series of engraved designs in illustration of the Book of Job. Flaxman was probably the greatest sculptor—certainly the greatest designer of sculpture—which England has ever had. His genius was precocious. At the age of eleven and thirteen years he won prizes from the Society of Arts. His best work was the sculpture of monuments for the dead, some of which adorn Westminister Abbey and St. Paul's. The work by which he is best known is the "Shield of Achilles," which has been widely reproduced. Like Canova he is a fitting representative of the Greek spirit in modern art. His home was a happy one, and he was a good man as well as a great artist.

Robinson has many allusions in his diary to the great English actors of his day. He saw Charles Mathews in his inimitable "Imitations at Home," when he would represent a dozen persons in an English stage-coach, and carry on amusing conversations interspersed with songs from several of the imaginary company. His powers of mimicry seemed to be almost perfect. He heard John Braham sing, and a great treat it must have been, for no one of that day had so fine a tenor voice as he. His musical career was one of triumph, even in Italy, the home of singers. He was a singer for sixty years, and for forty years was without a rival in England. There is no other case on record where a vocalist has held supremacy so long. "Braham's singing delighted me," writes Robinson. "His trills, shakes, and quavers are, like those of all other great singers, tiresome to me; but his pure melody and simple song clearly articulated are equal to any thing I ever heard." He records his impressions of Edmund Kean, who was great in Othello, greater in Richard, and greatest in Shylock. In bursts of passion and of grief Kean was unequaled. Robinson was present when Kemble, the greatest one of that name, and his more celebrated sister appeared in "Henry the Eighth." Concerning the latter he writes, "As an actor she has left with me a conviction that there never was and never will be her equal."

It was his privilege to hear several times Robert Hall and Chalmers, whose preaching crowded their churches. He was a visitor at the house of Edward Irving, the strange Scotch preacher, who flashed like a brilliant meteor, dazzling all observers, and then quickly died out. His brief career was strange, eventful, and sad. Robinson wedged his way into the Caledonian chapel, where Irving preached, before he was carried away by fanaticism, and says of him: "His eloquence is captivating. He speaks like a man profoundly convinced of the truth of what he teaches. He has no cant hypocrisy or illiberality." It is sad to think that such a man might have been saved if he had not been repulsed by the harsh criticisms of those who probably failed to understand some of his theological statements.

It was when on a vacation tour at Heidelberg that Robinson met Rev. F. W. Robertson, and says of him, "I like him much." He soon after heard him preach in the English chapel "a sermon much too good to be thrown away on a congregation of forty or fifty persons." In Brighton they renewed their acquaintance. Robinson frequently heard this celebrated preacher, and on learning of his death records this opinion, "Take him for all in all, the best preacher I ever saw in a pulpit; that is, uniting the greatest number of excellences, originality, piety, freedom of thought, and warmth of love; his style colloquial and very Scriptural. He combined light of the intellect with warmth of the affections in a pre-eminent degree."

But it would take a long time to speak of all the celebrities with whom Robinson had a speaking acquaintance—such as Lafayette, Brougham, O'Connell, Macaulay, and a host of lesser lights, among whom was De Morgan, great in logic and greater in mathematics. With scarcely an exception all these have passed away and their lives are "as a tale that is told." What a pity that there was not a full account given of that small dinner party in 1823, at which were

the five poets, Wordsworth, Coleridge, Lamb, Rogers, and Moore, at which party Lamb stuttered in his own innocent and amusing way, "Mr. Moore, until now I always felt an antipathy for you; but now, that I have met you, I shall like you ever after."

There are many other things in Robinson's diary which are full of interest to those who love English history and literature. It gives information which is of value and which can not be found elsewhere. The generation in which he lived has passed away; but the memories of the great warriors, statesmen, poets, artists, and preachers of that period will live while history endures.

MARA-ZION.

AT the extreme southern point of the British Isles is the beautiful county of Cornwall. Like Italy, this point of land is shaped like a boot, and just in the instep is a small town with a very high-sounding name. The villages all around it are said to be very beautiful, being built each in some glen or ravine, watered by lovely brooks wildly rushing over beds of granite, their banks luxuriantly covered with trees and flowers—Portugal laurel, tamarisks, and arbutus growing like great trees. The myrtle and arbutus form groves from twenty to thirty feet high, making charming natural bowers. Scattered here and there the cottages, built of granite, and with their gardens full of carnations, roses, fuchsias, hydrangeas, and other rich flowers, add to the beauty of the scene. The climate is delightful, and sometimes on the last day of the year lovely bouquets may be gathered out of doors. The vast moors purple with heath, and strewn far and wide with great bowlders of primeval granite, cut up into fragments and looking like the ruins of great cities desolated centuries ago, present contrasting scenes of grandeur. Or you see them piled up in weird forms like uncanny spirits perched on pinnacles from which they are every moment in danger of being hurled, while the vast ocean is seen and heard bellowing in the hollows of wild cliffs and caves. At its feet is the glorious expanse of Mount's Bay, and, opposite, St. Michael's Mount lifts its white granite head, crowned with lofty Gothic towers and battlements, reflecting the sparkling sunbeams, the great crags at the foot making an impregnable barrier to the billows roaring around its base. The town itself is famous for its beautiful mount, which contains tin, topaz, chalcedony, and garnet. It is separated from the main-land by rocks, which at ebb-tide may, for almost a quarter of a mile, be crossed on foot. This town is of high antiquity; for, according to its traditional history, and which also geological researches have served to establish, we are told that when Hiram and Solomon, of Old Testament fame, made their bargain for materials for the temple, the fleets of these monarchs visited Cornwall, so rich in various kinds of metals. The ancient historians of England affirm that there was no Mount's Bay then; but a wild, dense forest, the scene of Druid rites, covered the space of what is now the beautiful expanse of water, and St. Michael's Mount, called in "Doomsday Book" and all others of the oldest records "the hoar mount in the wood," is said to have towered as a beacon and landmark in the midst of dark forests six miles from the sea; and since the founding of the Cornish Geological Society in 1812, there have been discovered roots and trees, in fact, a great submarine forest, about four feet beneath the sand of the bay.

In these remote times, long before the water was there, it is said that Hiram's and Solomon's fleets were once cast upon its vast rocks. A few of the ancient mariners escaped death, but their fleet was lost, and their return to their native land prevented. After wandering about these shores, where Druidical superstitions prevailed, and forbade their mingling with the savage Britons.

the solitary Israelites built a few huts that soon grew into a village, which, from their distress, they called Mara-Zion, or the "Affliction of Zion." Here they raised an altar to the true God, first consecrating to him, after dark ages of paganism, England's fair shores. Digging for metals first gave occupation to these lonely children of Israel, and so the crags and caverns are venerated by Christian England as having first heard the echoes of the songs of Zion.

In this and other parts of Cornwall have been discovered hollow places containing scoriæ and slag and pieces of refined tin, which are called "Jews' houses" and "Jews' house tin," from a belief that these were the spots where the Jews smelted their tin ore. It is thought they did so by the simple process of blowing through tubes, blowing flame upon the metals through them, which produces a fire as fierce as that of a furnace, though not of so great an extent. So it is thought that the blow-pipe is a very ancient invention, and brought to old England's shores by the very romantic first settlers of Mara-Zion.

A SUMMER EVE.

HOW sweet at Summer eve,
By grassy bank or cleve,
At lazy length upon the soft turf thrown,
To scan the solitudes,
The peaceful outspread woods,
And fields with golden flowers freshly strewn.

Haply we then may hear
Come stealing on our ear
Some wild unearthly bursts of melody,
First in disorder'd notes,
Like the low strain that floats
As o'er the harp-strings playful breezes die.

Then with a deeper tone,
Fuller and fuller grown,
It swells and falls, and swells and melts away;
Then, as though hurrying back,
Loath to forsake its track,
Again we faint with joy to hear the magic lay.

Sooth, many a churl is found,
Who ne'er hath trod such ground,
And little recks of such wild minstrelsy,
And of such legend deems
As wandering madness' dreams, [sigh.
Or counts those pensive tones the leafy forest's

But we, whom fancy leads
'Mid hills and flowery meads,
Flying the smoky haunts of hackney'd man,
Stendfast on Nature look,
And con her as our book,
And with familiar warmth her chastest beauties scan.

She, kindling to our love,
Gives us too well to prove
How fetter'd to this clay our spirits are;
For while our souls upon
She pours each magic tone,
And fills with wizard harmony the air,—

Still our dull eyes are seal'd,
And round us unreveal'd
The airy minstrels lead their phantom choir,
While we entranced recline,
Taking no thought of time,
And mounting at each strain in fancy higher.

But, should a step intrude
On our deep solitude,
Sudden we start to weary life again,
And that strange minstrelsy
Is silent as the sky,
We list, and list to catch a note in vain.

But be intruder far,
Nor let us dream we are
The careful denizens of this rude earth,
The while with ravish'd ears,
And eyes mantling with tears,
Of wildest, noblest thoughts we hail the birth.

What though each banish'd scene,
Where earliest joys have been,
Return no more to cheer our blighted way?
Better thus, in rapt trance,
On shatter'd hopes to glance,
Than rear fresh piles again to meet the like decay.

MAROUSSIA: A RUSSIAN LEGEND.

FROM THE FRENCH OF P. J. STAHL.

CHAPTER I.

I AM about to relate something that happened a long time ago in Ukraine, in quite an obscure but fresh and altogether charming little corner of that country. I like places that are seldom talked of—that strangers do not often visit—that are left to themselves in the charm of a quiet seclusion. Keeping their own secrets about the most delightful trysting-spots, guarding well their dearest sentiments, their hardest trials, as well as their simple enjoyments, their history does not belong to every body. Their manners and customs are not a copy of those of their neighbors, and if they are proud they are scarcely conscious of it; they are at the same time confiding and unsuspicious.

These little spots have sometimes, without boasting of them, their true heroes. I like such heroes, especially when they do not suspect it themselves, when they are noble and sincere and can do great things without crying out to all the world, "Come! see; I did that—now praise me for it." Solely by reason of being just what they are, having these natural qualities they can not be other than "heroic." But enough of philosophy, as our school-master used to say, when he saw we either did not understand or accept his advice. Let us return to our story.

There was once upon a time, in this little corner of the world to which I have referred, a quaint old house, built a good deal like all the houses in the country round about, and in this house lived a Cossack named Danielo Tchabana with his family.

Now I beg of you do not confound these Ukrainian Cossacks with those of the Don. Those fierce men, with terrible rough beards, round eyes, coarse language, and uncouth manners, did not in the least degree resemble these of whom I speak. The Ukrainians never wear beards until they are fifty years old, so that one saw in this country only gray beards or smooth faces. The young men sometimes wore a mustache, like the Poles. The Ukrainians are tall, slender, and strongly built. They usually have regular features, well defined eyebrows, large almond-shaped eyes, a calm, proud, rather severe, and somewhat sad expression of countenance.

Would you like to know what this word Cossack signifies? It is a word of Turkish derivation and means "a warrior on horseback." When Ukraine was an independent republic and made war upon the Turks, the Turks called these brave soldiers who fought so heroically Cossacks. I will not try to tell you all the history of this little republic, it would be too long. It is enough to say that during the long years of fighting for their independence these brave people found themselves between two fires, Russia and Poland. Indeed, we might say four fires instead of two, for we must also count the Turks and Tartars. Finally, unable to contend successfully against Poland, this little republic accepted "fraternal" proposals from Russia. "We are too feeble to struggle any longer with our neighbors," they said. "We have sustained the war gloriously, that is true, but we will probably end by our being crushed. Russia proposes an alliance, let us accept it."

Thus felt and spoke the old chief Bogdan Khmulnitski, and the people agreed with him.

For a time all went well. Equality, fraternity, liberty. Russia respected their treaty, but by degrees things changed. At the end of about a year, the people had a thousand reasons for saying to their old Chief Bogdan, "Alas! what have we done?" The brave old chief understood it all only too well, and he wept, they said, for the first time in his life. "We will do what we can to remedy our mistake," he replied; but he could not succeed in bettering their condi-

tion, and soon the old man died of grief. After his death Ukraine was compelled to submit to many trials and humiliations. It was finally divided into two camps. The one adhered to Russia and the other put themselves under the protection of Poland. A third party, indeed, was formed, and this was for independence; but, alas! it was so very small. Precisely at this epoch our story begins.

I have said that the Cossack Danielo Tchabana lived with his family in a small country house. The most discontented person in the world would have been pleased with this house. Danielo had inherited his comfortable little home from his own father, to whom it had been transmitted at the death of the grandfather, and so I don't know how many generations of Tchabanas had passed away from this snug old homestead. It is often remarked that, however wild and uncultivated the surroundings of a new Ukrainine home, the first Spring-time will cover the whole earth with flowers. So you may imagine what a paradise of flowers encircled Danielo's cottage after so many generations had each added their parterre to the ancestral domain. However, we ought to say that Danielo's dwelling-place could never have presented a wild or desolate appearance even to the earliest settler. On the contrary, situated, as it was, between a wide extended steppe and a vast forest, its boundary lines being marked by a deep river, a velvet prairie, a high mountain and a rich and fertile valley, it must have been always charmingly fresh and green, presenting to the eye of the first comer even, in its wild uncultivated aspect, a scene truly picturesque and attractive. Towards the north the steppe rolled away as a flowery plain into indefinite space. It might have been an emerald ocean, thickly strewn with flowers. To the south arose the mountains, partially covered with forests of verdure, yet presenting their strong, uncultivated and picturesque heights. The delicious valley, quite solitary without either highway or by-path, stretched far towards the east. A river of deepest blue watered the prairie—sometimes it flowed quietly, reflecting the azure sky and the reeds and rushes upon either shore, which formed a beautiful frame to the lovely picture; and again dashing against the rocks, it bounded, boiling and foaming, under the arches of gray granite.

How beautiful and peaceful was this lovely corner of the world! When the sun was up and the dew covered with rosy brightness every blade of grass, 't was like a shower of diamonds and sparkling gems. The birds, concealed in their shady coverts, chirped and sang and hopped about as if too happy to be still, whilst a luminous veil of vapor, tinted and gilded by the magic rays of the sun, floated or hung lightly over the river.

How exquisitely the perfume of flower and shrub blended with the beauty of this lovely vale in the early morning light! The summit of the mountain shone like burnished gold, the forest awoke gradually from the slumbers of the night into a lovely chorus of song, and the plain was a picture of ever-shifting light and shade as far as the eye could reach. This was the morning—the auroral dawn; but the day, the *full* day, how can we paint its marvels of beauty? A flood of glorious light from the azure vault above, the triumphal songs of many birds, the murmur of the water and the sighing of the breeze,—all nature was full to the brim of joy and beauty. As the day drew to its close, the evening—those peaceful, rosy evenings of Ukraine—may be imagined but not fully described.

The stars arose one by one to welcome the moon as she appeared in her full grace and majesty, and the horizon was resplendent with bands of variegated violet, which threw the light of their expiring fires over the dark and silent plain. The border of the forest became dim, and then mysteriously dark. One huge rock, touched by the deepening twilight, threw its shadow over another and another, till, polished like blocks of jet black marble, they stood forth in bold relief in the deepening gloom. In the little garden, with its tufts of flowers, between the branches of a wild rose-tree and the snow-white bloom of the cherry, gleamed the pretty little windows of Danielo's house.

But I am perhaps wrong in attempting to

describe pictures of which the eye could never grow weary.

I must add that with all this natural splendor of landscape, all these blessings from a good and beneficent God, the inhabitants of this charming little home were also surrounded by good and tried friends. On fête days, especially, the family of Danielo Tchabana had many visitors. Sometimes it was Seménе Vorochilo who came, sometimes Andry Kronk; again they heard in the distance the fresh, musical voice of Hanna, the laughing beauty and belle of the neighborhood, or perhaps they saw the little boat of Vassil Grime approaching the shore, and, following him, five, six, perhaps ten others, men, women, young girls, and youths, little children and the gray hairs of age—all were friends and visitors of Danielo. Why should I try to enumerate them? They were not few, and when I tell you they were firm and true, what more can I add. I would not presume to tell you how good it is to have friends. If ever you have felt that sentiment for one who was worthy, you know its real value. The word of a friend, the answering eye of a friend, his hand in yours, make three-fourths of the happiness of life. If you have never known this happiness mere words will not teach it you. Make yourself worthy of true friendship, then may we talk of its hallowed, blessed influence; otherwise, were you as great as Solomon himself, you could not comprehend its pleasure and its priceless value. Certainly one might have been very happy and contented in a spot such as we have described, if men were like their flocks and herds, desiring nothing higher or better than rich and abundant pasturage. But I have already given you to understand the state of affairs—trouble and distress reigned supreme. The country was greatly harassed on every side. Oppressed and downtrodden by the Russians on the one hand, and by the aristocracy of Poland on the other, a general revolt ensued, and the people bitterly lamented their lost independence. Ukraine was invaded by Russian troops. The chief of the Muscovite party was overwhelmed with favors from the czar; the chief of the Polish division fortified himself in one of the towns, and invited all friends to join him there. Which side was safest?

The times were hard indeed. Eyes unused to weep were overflowing with tears, and the wisest heads were puzzled.

CHAPTER II.

AN UNKNOWN TRAVELER.

THERE was a reunion at the house of Danielo Tchabana. The evening was dark and gloomy; the host pensive and silent. Those usually most talkative and hilarious scarcely smiled. They looked more than they spoke. It was plainly visible that every body had the same care.

From time to time one addressed himself to Andry Kronk. Were the walls of Tchiguirine able to resist an assault? Were the defenses secure? Had they read the last proclamation of the chief? Did they know whether many volunteers had presented themselves? Andry Kronk, evidently well-informed about all these things, replied very satisfactorily. He described the ramparts of Tchiguirine, the moats, the gates, the trenches, like a man who had passed that way and seen every thing more than once, and very recently, too.

Whilst the men were talking the women listened anxiously, and when the men smoked silently for a while they would exchange a few words in a low tone.

"Another battle near Velika," said one.

"How many were killed?" demanded Moghila.

"They have burned Tirny. The houses are reduced to ashes, and the village Kritritza is burned also."

"Do you know," said a young girl, "do you know whether—?" but she could not finish. Her lips grew pale, great tears blinded her eyes, and her teeth were so firmly set by anguish that she could not unclose them.

An old woman with a brown handkerchief twisted about her head, from which escaped a few locks of beautiful gray hair, with cold, rigid features, in the midst of which her large, black eyes burned like stars, said:

"Mine are all dead. I am alone in the

world. They said to me, 'We are going away to fight,' and I, looking at them, replied, 'Yes, my children;' and they added, 'Ukraine shall regain her independence,' and I replied again, 'Yes, my children.' All three of them were left on the battle-field, and Ukraine is not free."

"Ah," said a young women, "our men are killed, and yet nothing is gained. If they might only say, I die, but I leave to others that which I die for—"

The old woman quickly interrupted her.

"Thou hast not comprehended me, child. When we act and work for our country, we are not trading. We do not say, Shall I succeed? but, It is my duty; and we throw ourselves at once into the thickest of the fight. If we are killed, we have died well. It is a better fate than to live ill. Mine acted just so, God rest their souls. If it were to do over again, they would do just as they have done."

"You are right, you are right," cried out several women at once.

Others said nothing, but wept silently.

The children even were silent. They played no longer. They neither cried nor laughed, but, scarcely daring to breathe, stood almost like statues, looking curiously into the faces of the older people, and hearing every word that was said.

A little girl, very, very small, with beautiful blonde hair, great, bright eyes, and scarlet lips, seemed entirely absorbed in her own affairs. She held in her apron bits of pliant twigs, which she was weaving and plaiting into a pretty mat.

The evening advanced, becoming more and more gloomy, yet still more quiet and calm. Every body ceased talking; the little girl fell asleep with the unfinished mat held lightly in her delicate fingers.

Night came and the stars shone forth brilliantly. Suddenly there was a knock at the window. This was so unexpected that they could not believe their own ears; but the knock was repeated again and again, very distinctly, very firmly.

The master of the house arose and walked towards the door to open it. His guests relighted their pipes and began to smoke. A final knock, quick and sharp, was heard upon the window. The smokers trembled slightly—the children looked at them inquiringly. Danielo partly opened the door, "Who knocks here?" demanded he. A firm male voice replied, "A traveler who has lost his way begs hospitality." "Welcome, welcome," said Danielo, and he opened wide the door and invited the traveler to enter. For an instant the inmates caught sight of the bright stars and a fresh breath of the evening air penetrated the warm room. There, upon the threshold, appeared a tall man of such height that he was obliged to bend his head as he entered the room. Beauty is not rare in Ukraine. Nevertheless, it would have been difficult to have found an equal for the traveler who had just entered the cottage. His face was one of that noble type upon which the eye of the most careless observer rests instinctively, with a sudden sentiment of respect. One was compelled to say in looking at him, "That man ought to be a king among men." His tall figure was elegant and graceful, his whole physique breathed forth calmness and strength. Never did stars or diamonds or the lightning itself show more brightness than sparkled in the eyes of the splendid stranger. Master Danielo and his friends were struck with all these things, but the Ukrainians know how to keep their impressions to themselves, and they betrayed nothing of what they saw and felt, receiving the stranger just as a traveler should be welcomed in an honest man's house, with cordiality and friendly recognition.

They gave him a chair near the table and kindly offered him refreshments. The traveler bore himself with modesty, politeness, and some reserve. Being a stranger, and consequently having no right to any especial attention from the host and his friends, he did not seek to obtain it. He did not at once begin, as many others would have done, to relate his adventures. He did not think it right to make strangers a party to his schemes if he had any—he did not even look with a curious questioning eye upon the people and their surroundings. He asked no questions, but replied kindly to all

that was said. When he spoke it was about things which at that time interested the world at large, the disasters to the country, the burning towns and the devastated fields which he had seen on his route.

Master Danielo and his friends imitated the stranger's reserve. They were probably asking themselves whence he came and where he was going, in what part of the country he was born; but since he said nothing they demanded nothing. They saw very plainly that though still young he knew a great deal of the manners of the Turks, the customs of the Poles, the character of the Russians, and the habits of the Tartars; he was familiar with it all. He appeared not less acquainted with the Island of Setch. As for Ukraine, 't was evident that he had traveled over the whole of it—that he had visited, perhaps lived in, the larger cities as well as in the smaller towns, and was familiar with many of the country homes. More than one of the guests had noticed and were wondering about a deep scar on his left cheek—where and how had he received this wound? certainly it had been given by a trenchant blade. But that concerns himself alone.

Meanwhile the traveler, reassured by the welcome he had received, became more communicative. He described with a startling vividness the battles which had just taken place; one might have supposed that he had taken part in them. They listened to him with closest attention, scarcely daring to breathe. The men, usually so impassive, were all aglow with enthusiasm—the women wept and sobbed aloud, and the children forgot their inclination to sleep and listened with breathless interest. Suddenly they heard two shots, then several others quickly followed a short interval, and still another was heard. All ears were strained to the utmost. These shots came from across the steppe. They listened for a long time, but the silence was not broken.

"Ah! powder has a voice even in your peaceful country," at length said the stranger. "That must have come from beside the highway leading to Tchiguirine." "That came from every side successively," said Danielo, shaking his head. 'T was growing late. The women arose to return to their homes. "We must put our children to bed," said they. More than one had instinctively taken theirs into their arms. Some of them were large and robust, others small and pale. There were young and old, but all had the same expression—that expression of strong energetic will we often find when, after many sufferings and struggles, the decision is made to be calm in the face of every thing, were it death itself. They bade each other again adieu upon the threshold, exchanging an affectionate smile or a friendly nod of the head. All passed away quite as usual, and yet every one felt that there was a gathering tempest in the air. In the eyes of these women, these mothers, these sisters, the affianced and the young girls, there was but the glimmer of a faint hope. "Adieu, adieu," they said calmly. "Good night," and all the company dispersed along the gloomy foot-paths and disappeared. The two most intimate friends, Andry Kronk and Semme Vorochilo, alone remained with Danielo and the unknown traveler.

CHAPTER III.

THE LITTLE MAROUSSIA.

WHEN at last the two friends and host were left alone, the mistress of the house having retired to her own room, "Is there any means of conveyance from here to Tchiguirine?" asked the stranger, lowering his voice and speaking very confidentially, as one involuntarily does when danger is nearer than he would like to acknowledge.

"That might be very difficult," replied Master Danielo, instinctively in his turn speaking almost in a whisper. His two friends said nothing; but quietly puffed great volumes of smoke from their pipes, closely contracting their bushy eyebrows. This expressed, without words, but quite as plainly, the same advice as Master Danielo had just given.

The eyes of the stranger were fixed for an instant upon the stolid figure of Danielo, then with the same searching glance upon the faces of the two friends. A single look

of his penetrating eye was sufficient to discover what kind of hardships and trials they had been accustomed to, how they would despise peril in the hour of necessity and with what skill they could ward off a blow when fortune and life depended upon it. This mute confidence established, "Nevertheless," said the stranger, "I must go there, and by the shortest and most direct route."

"A direct road to Tchiguirine," replied Andry Kronk promptly, "even a crow could not accomplish that."

"Is the distance very great?" demanded the stranger.

"The length of the way does n't matter when the road is good," said Semme Vorochilo; "but if that were all right, if it is absolutely impossible to go, what difference does it make about the road?"

Pronouncing these words Semme Vorochilo fixed his eye steadily upon the face of the stranger.

"We travelers," replied the unknown man, "are not always at liberty to choose the most agreeable road. In default of a good one we must be satisfied with even the worst. What matters it? When one is ordered to go to a certain place there must be no drawing back. Sometimes he may be fortunate enough to procure a faithful, reliable companion in his journey! I will not conceal from you, most honorable masters, that I have been more than once so fortunate as to meet at the most hopeless moment just such brave hearts and strong arms, tireless feet as were necessary to me."

At these words of the stranger Master Danielo and his two friends raised their heads.

"You are right, honorable stranger," replied Danielo, "a brave and devoted companion is worth all the doubtful in the universe."

"There is no lack of resolute hearts in Ukraine," said Andry Kronk; "as to that, I 'll vouch for it no other country can surpass our own."

"Well said, Kronk," replied Master Danielo.

"The Poles may boast of having brave lords; the Turks of their magnificent sultans; the Muscovites of a set of intelligent, skillful, merry fellows; as to ourselves we can boast of one thing, which is worth all the rest;—it is that we are 'Brothers,' no more, no less."

"In the best fields we may find a bit of cheat," quickly replied Danielo; "but is the wheat any the less good for that?"

"No, certainly not," said Vorochilo; "still there is something yet to be considered."

"What is that?" replied the stranger.

"It is that we can not always distinguish the good from the bad grain. 'He who wears a black cowl is not always a monk.'"

"The Good Shepherd recognizes his sheep even under the wolf-skin," said the stranger.

Then they sat for some time in perfect silence looking from one to the other. They were learning to understand each other, and words were become useless.

"Brothers, I salute you," at length said the stranger. "Your brothers of the Setch send you respectful, friendly greeting; I am their envoy. I am going to Tchiguirine."

"We are under your orders. We are your friends," replied the three Ukranians.

"What have you to tell me? What do you know? What is passing around you?" demanded the envoy.

"Nothing good," replied Danielo. "One is in league with the Muscovites; another, after having invited the Turks to come to his aid, is at this very moment in conference with the Poles."

"That is only too true," said the friends, and their strong faces expressed profound grief.

"The more reason why I should go on to Tchiguirine," said the envoy of the Setch, "and without losing time."

"All the roads are cut off," replied Vorochilo.

"And the Passage of Gonna?"

"Occupied and put in a state of defense by the Muscovites."

The envoy was plunged for a moment into deep thought, not over the difficulties, but over the means by which they should be overcome.

"We Cossacks of the Setch," said he at

last, "we are neither in league with Muscovites nor Poles; we fight for Ukraine. You see, then, how necessary it is that I should get into Tchiguirine. Of your two chiefs one has sold himself, they say,—but the other?"

"The other, the Aman Petro Dorocheuko," said Kronk, "is an honest man."

"I know it," said the envoy; "but proud, passionate, and impulsive as he is, we may well fear that with the earnest desire to save Ukraine he will lose it. In his irritation against the Russians he forgets that we have other adversaries.

"He is upon the point of doing a very foolish thing—in plain words, throwing himself out of the frying-pan into the fire. I am commissioned to prevent this—but in order to succeed it is absolutely necessary that I see him. If I am delayed—" Here the envoy suddenly stopped and looked about him. The mistress of the house was still absent—two little boys were sleeping quietly upon a long bench. He was upon the point of resuming his discourse when suddenly, at the extremity of the apartment, he saw two large sparkling eyes fixed upon him, which seemed to drink in every word he said. He arose and walked toward this disquieting vision, when he discovered that these two glowing eyes were those of a simple, kindly, little girl who, crouched in an obscure corner of the room, was gazing at him like a charmed bird.

Danielo had followed the eyes of the envoy, and discovered the object of his preoccupation.

"That is my daughter," said he, "my brave little girl, good and wise far beyond her years;" and, calling to her, he said, "Maroussia, come here." Maroussia approached immediately.

She was a veritable little Ukrainian girl, with velvet eyebrows, cheeks browned by the sun, yet altogether exquisitely beautiful—beautiful by reason of a charming expression of countenance as well as by regularity and purity of feature—true type of Ukraine.

She wore a loose embroidered under garment, according to the fashion of the country; a petticoat of dark blue and a scarlet girdle. Her magnificent hair of golden hue was plaited in heavy masses; yet the curls escaped from the folds, rippling and shining in silken waves. The girls of this country are always adorned with flowers in Summer, and Maroussia still had a few bright red blossoms in her hair.

"Maroussia," said her father, "thou hast listened to our conversation."

"I did not wish to listen," replied the child. "In spite of myself at first I heard much that was said, and after that I did listen."

"And then what didst thou hear, my child?"

"I heard every thing."

Her voice was admirably clear and firm.

"Tell me what hast thou heard, my child?"

The brilliant eyes of Maroussia were turned quickly and steadily toward the envoy of the Setch.

"I understood that it is necessary that our great stranger friend should go very quickly to Tchiguirine, and that in order to save Ukraine it is necessary that he should see the Aman."

"Thou hast heard all, indeed," said Danielo, "and understood it all. Now listen to me, Maroussia. That which thou hast heard this evening, thou must never speak of to a soul that lives. If any one asks thee questions, thou knowest nothing. Dost thou comprehend what a secret is?"

"It is something that must be kept at any price and in any danger," replied the child.

"Very well," said the father, in a grave tone, "thou art now the keeper of a secret."

"Yes, father," said Maroussia.

Master Danielo said nothing more. Maroussia made no more promises, but those two words, "yes, father," spoken as that child uttered them, would have removed the incredulity of St. Thomas himself.

"Where is thy mother?" demanded Master Danielo. "Go and tell her that the little brothers are asleep."

Maroussia turned toward the door, but the moment she had opened it stopped suddenly, listening acutely to a noise from with-

out. One might have thought a whole troop of cavalry was galloping in the direction of the house. The noise increased rapidly. Cries and imprecations were mingled with the neighing of horses. In an instant there was a tumult equal to the arrival of a train or a full detachment. Hoarse voices and bitter cursings were heard from all sides. The door of the bed-chamber opened and the mistress of the house, with blanched face and startled eyes, said:

"Those are soldiers—a squadron of cavalry—perhaps a whole regiment. They are—"

"Do n't let it frighten or make you lose your senses," said Danielo.

The Setch envoy had arisen quietly with no appearance of alarm, and the others were no less composed. Not a word was spoken. Each one was thinking rapidly of the best step to be taken.

The mother of Maroussia closed and barred the door, and, with her back against it, stood waiting the orders of her husband. Maroussia clung to the side of her mother. Her lips were a little pale, but her countenance expressed perfect calmness.

"Thou, Vorochilo, and thou, Kronk, art asleep. My wife and daughter are occupied in sewing; but I am absent. I've gone to see a friend. Vorochilo and Kronk have come to buy beeves from me. They have, perhaps, been drinking; are sound asleep and snoring, whilst they await my return. This in order to gain time." Then addressing himself to the envoy, he said: "The front of the house alone is occupied. The window of the kitchen opens upon the step. Follow me."

The father exchanged a hasty and significant glance with his little daughter as he left the room. All this was executed as quickly and perfectly as if prepared a long time beforehand. The two men lay down upon the benches, sleeping as quietly as the little boys had been for an hour or two. The mistress and the little girl were sewing. Master Danielo and the envoy had disappeared.

"Dismount and knock at the door," cried a rude voice from without.

"Blood and thunder! stave it in," roared another, more imperious than the first.

The mistress of the house, with work in hand, approached the window.

"Who is there, and what do you want?" said she, in a tone of voice which did not betray the least alarm.

By way of reply several of the window-panes were smashed with a terrible crash. At the same time the head and shoulders of a large man, whose red and angry face carried a bristling mustache, leaned across the casement, hastily searching with his fiery and malignant gaze every corner of the room.

"Why do you stand looking at me?" cried this person. "Why not open the door? Do you prefer to have it beaten down?"

The mistress, thus addressed, recoiled a step or two. "The children are asleep," said she; "and it's a wonder that they can sleep so quietly. These two men are asleep also. Pray do not make so much noise."

"Open the door, foolish woman," vociferated the man.

The wife of Danielo, as if paralyzed with fear, did not move a step. The door trembled violently under the blows of the assailants, but she did not yield. The body of the man, his face still more scarlet with rage, was thrust half-way through the broken window, and the muzzle of a large pistol was pointed at the breast of the mistress.

"If in one second this door is not opened wide," cried he, "I'll shoot you down."

The wife of Danielo took a step toward the door, then stood like a statue in the effort to obey an order which she seemed not quite to comprehend.

"Cursed woman," cried the furious officer; but some one from without caught hold of him and drew him away, when the figure of another officer appeared.

"Woman," said this man, "we will have the right to fire upon your house, and not one of its inmates shall go out alive if you do not at once open the door and allow our men to enter."

The mistress, as if completely bewildered with terror, went hastily toward the door, but

either by reason of awkwardness or terrible fright, it seemed as if neither key nor bolt would respond to her efforts.

"I will open, my lords; do you not see that I am trying? But this lock bewilders me so; I must certainly have it fixed to-morrow."

At last the door flew open. God grant she may have thus secured time enough. Soldiers and officers rushed precipitately into the cottage, and instantly they set about searching every corner. One might have thought them a pack of wolves in search of prey that had suddenly disappeared. The smallest of the two boys awoke suddenly from his sleep, uttering the most piercing cries. The oldest one looked around upon every thing without showing any alarm.

"You squalling brat, hush this instant,' said one of the officers to the little boy who was crying. The officer with the fiery red face said nothing, but lifting his foot sent the little fellow, mute at last with terror, rolling under the bench upon which he had just been sleeping.

"Coward, coward!" said the oldest boy; "when I grow to be a big man—"

But the ugly, red-faced man had other things to listen to at that moment. With a second kick he had raised Kronk, who seemed to be in a drunken sleep, opening and closing his wondering eyes as if making an effort to keep awake.

Vorochilo, awakened by the same process, seemed as if he did not know what to think at seeing these aggressors. He called the big officer by the name of one of his boon companions, Generasime, and the other he called Stephane, gazing at one with a stupid smile and winking his eye in a friendly way at the other, fell back again upon the bench, saying:

"Let 's all go to bed; it 's quite time."

The soldiers looked from one to the other.

"That is he," said one.

"That is not he," said the others.

"What a set of rascals these people are! There is not one among them who is not a traitor."

"Silence!" cried the man with the red face. Then seating himself at a table, he made a sign to the mistress of the house, saying rudely, "Come here."

She approached the table.

"Who are you?" demanded he.

"I am the wife of Danielo Tchabana."

"Where is your husband?"

"He has gone to see a friend."

"Wait. I shall have to learn something more about this friend." Taking up a knout which one of the soldiers carried—one that was richly ornamented and carved upon the handle—"And those two, those drunken rascals, those two dogs, who are they?"

In order better to make her understand of whom he spoke, he struck the shoulders of Kronk and the body of Vorochilo with the knout.

"Wilt thou speak?" said he, making a menace toward her.

The woman stepped back instinctively, as she would have done if she had found herself face to face with a wild beast; but after a momentary effort overcame her dread.

"Those are my neighbors, my lord. They have come to buy cattle, and fell asleep while waiting for my husband."

"Yes, my lord, we have come to buy three beeves of Danielo," said Andry Kronk. "Yes; these cattle we promised to deliver to-morrow, and we do not find Master Danielo at home. Judge of our disappointment! 'Well,' said I to my companion," pointing, as he spoke to Vorochilo, who although awake, seemed scarcely to be able to keep his eyes open; "'well,' said I to my comrade, 'the master is not here; that 's unfortunate.' 'Yes,' replied my comrade, 'that is unfortunate; for there is nothing to be done.' 'What bad luck!' said I; 'but what will you do? he is not here.' 'No;' replied my man, 'Danielo is not here, and a whole day is lost—yes, lost,' replied he; 'but what will you do?' 'One can 't always foresee every thing.' 'No,' said my comrade again; 'one can 't foresee every thing. But notwithstanding that the market will be held to-morrow.'"

"Will you never finish, rascals?" cried the man with the red face. "Oh, you traitors, I know your cunning. Soldiers, bind these two fellows, and do it well."

She remained a long time leaning against a tree, whose foliage had protected and concealed her. The breeze strewed the white flowers of the apple tree over the green turf, and the child said to herself, "It is just like snow." Yet she was afraid that the rustling of the leaves might obscure another sound, the faintest indication of which the bowed head and attentive ear was intently listening for.

Ah! a few steps before her, between two trees, standing erect. Could she be deceived? was it only a shadow? No, it was the tall, slight figure of the new friend, for whom, at this moment, her father and mother were suffering,—for whom also she would brave every thing. The figure was not still, but glided, like a serpent, in and out amongst the trees. It was seeking, certainly, the narrow hidden pathway leading to the river. With a rapid step Maroussia ran after him. Very soon she heard the noisy flow of the river. A hedge only separated the envoy from it.

Over this hedge he leaned and looked, and at the foot of an enormous tree, whose branches dipped into the flowing stream, he saw a boat. A boat! that was his especial object. The river, this was the road which would not betray him, and he was about to clear the hedge which separated him from it, when suddenly two little hands closed upon his arm, and a low, sweet voice said to him:

"No, no, not that way—not the boat. The river is a mirror, upon which every thing can be seen, even at a great distance."

Certainly he was very much astonished, more astonished than if he had found himself suddenly surrounded by a dozen soldiers armed to the teeth; but he did not allow himself to show it. He was a man too long habituated to every kind of surprise. He very soon recognized the little girl.

"What art thou doing here, my little girl?" asked he, smiling upon the child, as if he had met her in an evening walk under circumstances the most favorable to friendly conversation.

But some seconds passed before Maroussia, out of breath and much agitated, could add any thing to the words she had first uttered. The man rested his hand upon the head of the child and passed it caressingly over her hair as he said to her, "Recover yourself, my little one." He was strong, intrepid, shrewd, and valiant, but at this moment, before this palpitating little bird, a ray of divine kindness softened and effaced all else from the manly visage of the soldier. His strong hand, accustomed to the use of deadly weapons and rude instruments of warfare, was gentle as that of a mother in its touch of Maroussia, and his eyes were full of tenderness as he looked upon her. Confidence, like that of long acquaintance, was immediately established between these two, and Maroussia soon found voice to say:

"The river will not best conduct you to Tchigurine, and that is the point you wish to reach, is it not? I've thought of another means of getting there."

"I am listening to thee, my child," replied the fugitive.

"Away down there, some distance across the steppe, my father has a little cabin and a stable where they leave the big oxen in Summer when they are making hay, so that they need not lead them back to the house at evening. A big wagon, filled with hay, is before the door, which is to be taken away to-morrow by my father. The oxen are waiting the break of day in the stable. We will be there, you and I, in one hour. Then I shall yoke, we will yoke the big oxen. You will conceal yourself under the hay, and I will lead you first to the house of Master Knich. Master Knich is a friend of my father and of all his friends. He comes to our house, and when he comes he talks with the others. I could tell him every-thing, or, if you do not wish it, I will not tell Master Knich any thing. But I will try to do—to do—"

She stopped undecided, for she did not know just what was best to decide on this point, but in a moment she resumed, "I will do just what you tell me. O! I will do it all."

As he listened to her his eyes were moistened with tears as he said, "Who gave you this idea, Maroussia?"

THE WOMAN QUESTION IN FRANCE.

THE aspirations of the new republican *régime* in France have brought into the foreground the question which has long been a bone of contention elsewhere—the education of women. And there it assumes the curious phase of a contest for the power and influence of women, between the politicians, the husbands, and the priests; and to judge from the general lamentations, the latter are now mainly in possession.

With all the social power that women have so conspicuously maintained in the course of French history, they have been kept very much in the background in the matter of civil rights; and the equality of rights between man and woman have ever been contested in principle, however much admitted in practice. The elasticity of the French woman will always bring her to the surface the moment the repressive force is removed. Abrogate the articles of the French civil code that prevent a married woman from controlling her property, and she would soon learn to administer her estates. Break the bonds that now enchain her, let her decide on her own career, choose her own studies, and develop her own powers, and she would take an important position in all the affairs of society and humanity.

And she is now struggling for equality—not identity—a condition which she is more likely to gain than at any former period in the history of her land. Some of the most intelligent of the French legislators are now earnestly endeavoring to enlarge the opportunities for female education, which are, on the whole, extremely restricted in France. In this regard the French woman is mainly in the hands of the priest. But her liberal friends are demanding that she have opportunities afforded by the state to have an advanced liberal education. The first echoes of this discussion were extremely dissonant to the French ear, and the people were hardly willing to listen to it. But by degrees the tones have become more acceptable and the discussions less harsh.

To indulge in a little retrospection, the woman question in France has never been placed in a sensible, not to say honest, light. It has nearly always been treated by extremists in the social economy, or by fanciful theorists. The sect of so-called Saint Simonians have inflated it, while the Fourierites have degraded it. None of the reformers have succeeded in placing it in a light whence any thing practicable could be observed. The liberty granted to woman by the reformer Fourier was a liberty of love, and virtually degraded her to the rank of a concubine. Enfantin claimed for her a sacerdotal character, like the priestesses of old, whilst the vulgar Proudhon saw for her no medium between the courtesan and the household drudge. Michelet thought to do her honor by a sort of exalted mysticism, and his poem of love was a continued accusation of feminine weakness; and by excess of tenderness he arrived at the same goal attained by Proudhon through austerity.

But many of these rude attacks have been lately most brilliantly answered by that famous authoress, Madame Juliette Lamber, in a work of superior polemics, entitled "Anti-Proudhon Ideas." And this same lady is now appearing before the French public as the editress of an enterprise entitled the *New Review*, the first numbers of which are now on the counters.

Girardin, the most famous of all French publicists, long ago advanced the theory of "equivalent powers" in the sexes in the following terms: "The sexes are equal, not in similitude, but in equivalence of powers and functions. If man acquires and produces, woman administers, saves, and preserves; and to defend her rights and interests is to do no wrong to man. To fight and conquer for woman is to fight and conquer for himself." But before arriving at this modern precision and simplicity, it was necessary to pass through a baptism of fire, and the alembic of sarcasm and reproach.

During the late Universal Exposition in

Paris there were world conventions of nearly every imaginable interest, and among these was one of the friends of woman's progress, composed mostly of ladies from many parts of the world. Our curiosity led us to spend an afternoon in listening to the debates, during which were said many reasonable and judicious things, interlarded with not a few eccentricities of an ultra character. When it came to the appointment of committees to prepare papers on certain subjects, one of the appointed ladies rose and begged to be excused for reasons that she hesitated to give. But the appointment being pressed upon her, she said: "My reasons for declining are purely of a family nature. If I should take an active part in the proceedings of this body I would become the target of sarcasm and obloquy, to the great grief of my aged parents. For myself I could stand this for the sake of my convictions, but I can not consent to bring grief to the gray hairs of those who are so dear to me." She was excused, and her name was only whispered among the hearers. She was said to belong to a distinguished family.

Indeed the shafts of satire have always flown thickly in France the moment the discussion of this question was brought forward. Even men of mental distinction have done but little more than favor it with biting sarcasm, and for nearly half a century it has been the last and most prolific refuge of caricaturists. The most famous one of these that France has ever known, the renowned "Cham," found the subject inexhaustible for thirty years, and recently died of grief, some say, because it was becoming the fashion to treat the woman question with calm reasons instead of ridicule.

Nowadays, however, this kind of argument is becoming difficult, for it affords nothing new, and the Frenchman is always on the *qui vive* for novelty. The individual initiative of women into the serious work of the world elsewhere has proved to France that she also may have an appropriate arena for many of her noblest daughters, so that she may soon point to them elsewhere than in the "Galeries of Celebrated Women."

Many of them have long been noted in the field of literature, and of late they are distinguishing themselves in painting, sculpture, and even science. Madame du Chatelet was formerly quoted as the most distinguished mathematician that nature had ever produced, and the names of other women in the discoveries of pure science have adorned the learned annals of France. But hitherto women have engaged in these labors unaided and without encouragement, while the tide is now turning towards a disposition to support and encourage them, and thus in the face of much opposition the French are much more inclined to look the problem of woman's advance in the face, and profit by what they see elsewhere.

And for this example they need less to look to the lands of dreamy poetry like Spain and Italy than to those of practical progress and modern development. England can not be taxed with frivolity as one of her faults, and there they find this question assuming almost national proportions. Germany can not be accused of levity and inconstancy, and it is gravely and seriously proceeding with method and reflection to enhance the sphere of woman's efforts. And more than to even these the French are looking to America where they find but little inclination to worship chimeras.

In this review they see the most distinguished men engaged in the serious study of the social condition of woman—such as Stuart Mill, John and Jacob Bright, Sir Charles Dilke, and Professor Fawcett, while at home an intelligent coterie of progressive men are led on by Emile de Girardin. The example of Germany, Switzerland, England, America, and even Austria, is contagious, and the result is a practical inauguration of a work that has too long been in the hands of utopians and dreamers.

And the prominent practical effort of the hour is the endeavor to secure a secondary education for girls that is not in the hands of the clergy, for at present the convent is the resort of nearly all the upper classes for the education of their daughters. Camille See is now engaged in urging on the French Chambers a proposition to have higher schools for the girls as well as for the boys, which

shall be in the hands of the state, and to which they can resort for daily lessons while living at home and enjoying parental society and care. The struggle is between what they call external and internal education. Hitherto it has been mainly internal; that is, the young girls have been "interned" in the convents with the privilege of occasional visits home, their guides and teachers being the nuns with the visiting priests.

The leaders in this movement are proceeding carefully, because of the very sensitive opinion in France regarding the liberties and privileges of young ladies. To talk about colleges or seminaries for girls is to endeavor to construct on a soil that for fifteen centuries has been encumbered by the convents and monasteries. France still lives in a society thoroughly imbued with the doctrines of the fathers of the Church, which have always been antagonistic to the progress of women. Their doctrine has always been that man and woman are not equal and can never become so. And it is not reasonable to expect much inclination in favor of social modifications in a society continually renewed by a Catholic cement of which the clergy is the spiritual initiation. The promoters of this new movement, therefore, find themselves opposed by all the licensed educators of girls, and consequently find it fitting not to shock the common prejudices by asking very much at the start. For the moment it is, therefore, simply proposed to aim at decreasing the distance that separates man and woman in the marriage bond. On account of her ignorance the wife seldom takes an interest in the labors of her husband, and is incapable of sharing with him any other sentiments than those of simple affection. But if their education be rendered more equal, the union will become equal between them, and there will be less room for the subtle influences of the professional directors of their consciences.

In this point of view they see in the proposition of the liberal deputy the germ of an evolution which will, when complete, afford the solution of the government problem. Michelet says, in his work on "Woman," "The girls of France are brought up to hate and despise that which every Frenchman loves and believes. Two separate times the women of France have accepted and then rejected and killed the revolution; the first time in the sixteenth century, when the struggle was for the liberty of conscience, and then finally in the eighteenth century for political liberty. They have clung to the past without knowing any too well what that past was. They too willingly listen to those who say with Pascal, 'Nothing is sure, therefore let us believe the absurd.'"

Now this picture is sketched in colors a little too dark, perhaps, especially as to the women of to-day, but the outlines of it are certainly taken from the facts themselves. The present education of women is certainly such as to bind them to the past, and the project of Mr. See is to gain them for the present, and above all for the future. It is in this spirit that he has drawn up his new programme of instruction, which is very good for a start.

He could construct establishments of a higher order for girls as they are provided every-where for boys; but this system has raised much opposition from those who are opposed to all internal instruction, even in the hands of the state, because a woman would find in these a very poor preparation for family life in this semi-convent style of education. It is maintained that women would become precocious in their attainments, *naïve* in their egotism, and uncultured in their manners, and the French would gain an education for their girls at the expense of their bearing and more solidity of mind at the expense of grace. The convents profess to teach all the graces and accomplishments, mellowed and subdued by religious training. But the greatest objection now made to separate establishments is the enormous expense to be incurred in supplying them immediately for the entire land. The outlay of so many millions in the beginning of the enterprise, would be an almost insuperable barrier, and to wait would be to sacrifice precious years.

The friends of the proposition contend

that a country that has its millions and milliards for all sorts of public improvements can hardly refuse a few of them for the noble cause of moral enfranchisement of the feminine portion of the population. But it is hardly probable that the friends of the measure can carry it in the face of the heavy expense that would be entailed on all the departments of the country, and with so many adversaries, theoretical and practical.

It would be a very gratifying thing to many if the higher education of girls could be irrevocably established by founding in all the cities of France noble structures on whose fronts could be inscribed "College for Girls." The possession of the feminine mind and intelligence by the secular spirit would then seem well established; but this is a satisfaction that it will certainly be necessary to defer for a time, and in the mean while France must be satisfied with what it calls "external education" for its young women. The advantage of the adoption of a system of instruction in which the girls may remain in their homes and merely visit the school building during the hours of recitation, is found in the fact that to this purpose may be used edifices already built.

The Gordian knot of trouble has been cut by the wise suggestion that the male colleges might be opened at certain hours and on certain conditions of control for the girls of France. It would be no great inconvenience to let these sit for a few hours during a course of lessons in history, geography, or mathematics on the same benches where sit at other hours their masculine rivals, receiving the same teaching. And to those who raise their hands with holy horror at the thought of the girls frequenting the same schools as the boys, is sent back the cutting reply that the sternest moral sense of Paris finds no incongruity in having all the public baths of the capital open for both sexes at alternating hours or periods of the day. Is the health of the mind so much more delicate a matter than that of the body? This settlement of the question will have the great advantage of putting into immediate operation a course of instruction at its most critical period. After it has been successfully begun and the advantages are obvious, the material difficulties will doubtless soon disappear. Where there is a will there is a way.

With this programme of operation well settled, the friends of this measure propose to make a vigorous effort at the doors of the legislative body for recognition and a hearing. And this will doubtless call forth a world of clamor from the convents and other clerical establishments of France for the education of young girls from the age of fourteen to twenty. But the liberals of the land are becoming accustomed to these wailings of clergy—the bonds have been galling them so long that they are determined to throw them off.

The priests of France are ever interfering between the parents of the land and their children, and in thousands of instances separate man and wife in the conflict; for the women of France are sadly under the control of the Jesuitical priests and teachers.

If a Frenchman, who no longer wishes his children educated in the Catholic creed, makes the request that they be not required to learn it, he is told to withdraw them from the institution. This would deprive them of an education, and the father yields by sheer necessity rather than let his dear ones grow up in ignorance. If a man would take a wife in civil marriage to avoid the annoyance of the requirements of the clergy, he finds most probably that the woman fears to brave the innuendoes that are cast at her by her Catholic friends. And few women can become resigned to live cut off from their usual and natural companions and friends as a leper. And the men that can live without religious bonds for themselves scarcely dare refuse them to a wife or daughter, for they feel that these are the cement of the family union.

Therefore, there is now a strenuous effort being made on the part of certain intelligent liberal leaders to get the women and girls out of the hands of the priests, and the most prominent actor among these is the now quite famous Bouchard. He is an agricul-

turist by profession, and was once the mayor of his own town of Beaune, and as a side profession in the law he has been counselor general for his department. Many years ago he broke away from his Catholic antecedents and became a liberal and a free-thinker. But as years and reflection came, his mind has been turned toward the Protestant creed, and he has since been very active in his endeavors to induce the free-thinkers to embrace the Protestant faith rather than to live in a state of ungodliness.

In his activity in this line he addressed a pamphlet to the citizens of his little town in order to stir up the men to this work and at a later period he directed another, entitled "Voluntary Servitude," to the famous three hundred and sixty-three deputies, who were virtually sent home by MacMahon when he disbanded the legislative body and ordered new elections.

His latest efforts are in the line of the woman question, or at least that phase of it which regards their servitude to the priests. He appeals to the "women of France" for God and their country in a letter on the title-page of which he places the following apt quotation from the well-known French Protestant Count Gasparin: "Let us not forget that we must ascend very high in order to obtain true happiness. We are always seeking it too low. The anchor of the soul clings only to the shore of eternity."

He reminds them that he has endeavored to show their fathers and husbands and brothers and sons, that they can not live without a faith, and that when they reject all idea of God they are committing an unpardonable error towards themselves. Then turning to the women, he endeavors to show them the cause of this error which is to them the origin of so much suffering and grief, and would point them to the means of stopping its source. He is an old man—has been the head of a family for forty-five years, and the love he bears his children and grandchildren has caused him to study closely the lessons offered to him in a long and extended intercourse with the world—and claims that this gives him a right to speak and be heard.

This celebrated letter is so direct and touching that our purpose will be best attained by giving the substance of most of it with an occasional condensation. Nearly two hundred thousand copies of it have been circulated in France, and it has proved a thorn in the flesh of the priests of the Romish Church, as it has verily penetrated the joints of their armor. After assuring his special auditors that his intention is not to afflict them, but to give them hope and to show them a better way to train their children, and especially their daughters, for their destiny and to secure to them less mournful days, he proceeds with the most cutting accusations that the clergy of France have ever been called upon to face in regard to their control of the women of the land:

"Concerning the indissoluble bond of marriage, Jesus said, 'For this cause shall a man leave father and mother and shall cleave to his wife; and they twain shall be one flesh. Wherefore they are no more twain, but one flesh. What, therefore, God hath joined together, let no man put asunder.' Cherish these wise words, and now let us see what ordinarily takes place in life between husband and wife when both are inscribed on the rolls of the Catholic faith, the woman practicing it, and the man not.

"You have just been married at the mayoralty and are now going from there to the church. (Civil marriage is obligatory in France, Church marriage optional.) While you as a young girl are devout, while your soul is penetrated with sacred emotions and you are praying with ardor, your betrothed, on the contrary, feels a secret uneasiness. But he is there, kneeling at your side, you have just taken your mutual vows, his heart is absorbed in you, your heart in him. Why then this uneasiness?

"Because, though he may not know it, he feels that this priest, whom your religion has placed over you as spiritual director, and to whom you have intrusted your most secret thoughts, will remain thus intrusted with your confidence, and that he, the husband, will always find him between himself and you. How much bitterness already in this prospect? and how much the devotional

and religious feeling must even there suffer by it! Thus, the very day of your marriage, the most solemn of your life, after that of birth and death, this day when there ought to be established between man and wife the firmest and most indissoluble union, which alone constitutes its grandeur, this very day appear the germs of the gravest disagreement.

"From the very beginning, then, in a religious sense, you are to live apart from each other, no communication, no exchange of thoughts between you regarding that which is of the utmost importance to you, all that which elevates, strengthens, and consoles the soul. To-day you are alone in presence of yourself—alone to-morrow in presence of the cradle of your babe—alone every evening when, fatigued with the cares of the day, your thought arises to heaven. You are also alone with your priest, because your religion tells you that he is the required intercessor between you and God, that he is the only interpreter of his Word, and that it belongs to no other to expound it to you—alone even in your readings, where will again be found the influence of the priest.

"Suppose you take an interest in the affairs of the hour,—in politics, science, literature, and the arts; the journals of your husband, his reviews, his books will not be ever yours. Alone, always alone!—consequently there is nothing that unites you in the elevated regions of the ideal and in those of the mind. And were it not that the voice of your heart is ever making its demands, and perhaps, indeed, the protestations of your conscience, you would scarcely have the bond of material interests to bind you together, since the absence of concord in things of a higher order must be followed with a divided interest in the lower ones. And in these conditions you are to fulfill the most important and grandest of duties—that of bringing up your children!

"It is true you have maintained the favor of your priest and his support, but how much does this aid you in presence of your children, especially your sons, when their turn comes to rebel against this dangerous intervention in the bosom of the family? They ignore your authority, and they even oppose that of their father already weakened by you. They thus escape from both of you at the moment when they have the greatest need of your care in order to guarantee them against the enticements of youth. And if, by chance, they have returned to you, it was when the evil which they had committed on themselves was irreparable.

"And what became of their religious feelings in the midst of this confusion and disorder? What became of the love that your children owe you, or the sacred bonds of marriage? There was nothing left but a weakening of religious feeling, a cooling of filial love, husband and wife strangers to one another, scarcely a common roof, and how many times separation and ruin! And all that, O woman, for having been alienated from the divine law in two of its most essential commandments—no intermediary between God and man, and none between your husband and yourself.

"And what has been the effect of the confessional? By removing the bitterness of repentance, it deprives the conscience of its most active and precious stimulant. In yielding up the conscience to the priest it is deprived of that living force which can only proceed from a direct and constant communication with God. Without doubt it is pleasant and easy to feel one's self absolved towards God by means of the absolution received at the confessional; but is there any certainty that God absolves us? The priest may pronounce absolution on an unworthy head; in this case it will have no effect.

"'God and the Gospel,' this is the law, and the whole law. Protestantism makes the family, and the family makes the nations. Catholicism divides husband and wife; Protestantism unites them. Become, then, Protestants in order to become true Christians. Return to this religion of true grandeur, liberated from all superstition, and free from all narrowness that obscures God and does him violence. Replace the weak and sterile offices which instead of enriching the heart impoverish and dry it up; replace these by the grand and broad service of righteousness taught in the Gospel.

"Then you women will have saved the country by rescuing it from the machinations of its most mortal enemies, the Jesuits of Rome. You will have reconciled it, elevated it, and brought it back to God. And from the low grounds where it now wallows and languishes, the human soul will resume its flight towards the luminous summits of Eternity. . . ."

Now it will be observed that in all that Bouchard advances in this magnificent appeal to the women of his country he alludes only to those who are Catholic in faith as well as name—the woman practicing this faith and the man not. He has not raised the question as to the women who in various degrees have broken away from the priests and yielded to the influence of their husbands. Many of these whose belief has become more or less doubtful are scarcely Catholics, but in appearance; they yield to the observances that they may not excite remark, or in order to conform to custom and accepted usage. But with their religious feelings thus weakened, and their principles lacking a base of support, they are exposed to a multitude of perils, and are in sad doubt as to the mode in which they shall educate their children. They have rejected the tyranny and bigotry of Catholicism and are now out at sea. Whither shall they flee for a port of refuge? In answer to this question, this same champion of their rights entreats them to study the principles of the Protestant faith, and find refuge in that communion; so that the much-abused "Woman Question" bids fair in its development in France to lead not only to the enfranchisement of woman from the burdens of ancient social shackles, but to bring to her religious liberty in bestowing on her the religion of liberty and modern times.

AMONG THE BUTTON MAKERS.

FEW industries have grown from such small beginnings to more important and extensive forms of manufacturing and trade in this country, and in so short a time as that of button-making. And with the beginning and early progress of this industry is intimately associated the name and fame of Rev. Samuel Williston. He was born on the twentieth anniversary of the battle of Bunker Hill (1795), in Easthampton, Massachusetts. After a serious experience in the labor of getting an education with very limited means, and still later a period of faithful work in the ministry, followed by a hand-to-hand struggle with poverty and all its rapidly accumulating ills, and with a further grievous affliction in the partial loss of his sight, he is found in the Summer of manhood at Easthampton farming, teaching, and preaching alternately, prospering in a small way, but burdened with a heavy debt he knew not how to pay. The relief so greatly needed came at last through Mrs. Williston's tact and industry. Remembering that her mother used to make covered buttons for her own family and occasionally sold limited quantities to her neighbors, she seized upon the idea of doing the same thing upon a larger scale, and, after a few experiments, succeeded in offering a package of her own hand-made work as a contribution to the cause of missions. President Humphrey, of Amherst College, became the purchaser; but neither party to the transaction had any notion of all that was to grow out of that transaction.

A second package was sent to Arthur Tappan, of New York, who immediately contracted for twenty-five gross at two dollars a gross. Never in all their subsequent wealth did the Willistons feel so rich as when they received that order. The first lot of buttons Mrs. Williston had made with her own hands; but now she employed the help of some of her neighbors to help her in her own house. After a short time her business so increased that she gave out buttons to be made in the neighboring families.

Two years later, in 1827, Mr. Williston went to New York and obtained several other customers, and returned fully prepared to extend the business and enter upon the life of a manufacturer. He made trips for the same purpose to Boston, Philadelphia, Baltimore, and other cities, and established agencies in nearly all the large cities. In a short time the business assumed such proportions that he had a thousand families at work making buttons. About ten years after the establishment of this great industry Mr. Williston discovered, in one of his visits to New York, some buttons of English manufacture, made without thread, needle, or fingers, but apparently by machinery. These buttons he submitted to Joel and Josiah Hayden, two very ingenious mechanics in Williamsburg, and offered to furnish capital, sell the goods, and divide the profits if they would discover the process, make the machinery, and produce the finished stock.

With true Yankee zeal and enterprise, they entered upon the work; but a whole year was passed before they could make a button. In the midst of their experiments a colored man, who had been an employé in an English factory, gave them the benefit of his knowledge; he understood the process, and could explain the machinery. The work soon reached successful completion, and was the beginning of Haydenville.

In 1839 Mr. Williston transferred the business to his native town, Easthampton, by which time the manufacture of buttons had grown to be an extensive business. Factory upon factory was erected, houses multiplied, and blocks of buildings extended until Easthampton had become a large and prosperous town. In 1841, Mr. Williston, finding his wealth increasing, established Williston Seminary; and four years later he founded the Williston professorship of oratory in Amherst College; in 1847 founded the Greek professorship in the same college, also one-half of the Hitchcock professorship; his gifts amounting in all to fifty thousand dollars. Later he enlarged the seminary buildings, increased the funds, and extended his charities in religious projects and educational schemes in a manner corresponding to his wealth and the progress of his business.

From that small but most necessary of all articles, a button, grew Easthampton's enormous wealth, extensive manufactories, liberal donations, and an honorable and enduring name. Mr. Williston died July 18, 1874, but the business that he erected is still carried on by the firm of Williston, Knight & Company—with Mr. Horatio Knight, who has been its chief manager.

A mill erected at Leeds—a village near Easthampton—a few years since embraces the ivory button manufacture, and the Easthampton and Leeds mill jointly give employment to five hundred operatives, and the combined production annually of cloth and ivory buttons is about one hundred and seventy millions of buttons. The ivory buttons made at the Leeds mill are from the vegetable ivory, and the production averages fifteen hundred gross daily.

The Williston Company consume annually seventy-five thousand dollars' worth of stock, and produce one hundred and seventy-five thousand to two hundred thousand dollars' worth of buttons. The capacity of the Williston Button Works at Easthampton is three thousand gross per day, that of the Leeds Mill in ivory stock one thousand five hundred gross per day.

The mills of this firm organized under the laws of Massachusetts are said to be the largest and best of their kind in the world. The most skilled workmen are employed, and to the inventions of their own artisans they have added very largely the labor-saving inventions of others.

Earlier than the first manufacture of cloth buttons in the United States, gilt buttons had been made in various parts of the country. In 1802 a firm known in those early days as that of Abel Porter & Company, in Waterbury, Connecticut, was engaged in this manufacture. That initial enterprise was the beginning of the brass and copper business, which is still so extensively carried on in that city. In 1810 Mr. Aaron Benedict, son-in-law and successor of Abel Porter, began also the manufacture of bone and ivory buttons.

In 1823 the manufacture of sheet brass as a supply for gilt button stock was commenced. Under the firm name of the Waterbury Button Company, the industry was re-organized in 1849, and has gradually grown in magnitude and importance till it has become one of the largest manufacturing enterprises in the United States. During the late war the company furnished large quantities of stock for the army and navy. They afford employment to over two hundred operators, and turn out a daily average production of from one thousand to one thousand four hundred gross of gilt buttons. Their machinery is of the latest and most approved patterns, and many of their most ingenious mechanical inventions originated in their own establishment. The most expert die-sinker in America is employed there; and dies for the coats-of-arms of every State and Territory in the Union are kept there, and orders in their own class of work are filled with great rapidity.

The materials chiefly used in this manufacture are cloth, shell, ivory, horn, bone, glass, rubber, various metals, pearl composition, coquilla, agate, celluloid, and lastly, and most curious of all, marble from Saxony, and blood, coagulated and hardened, known as "Vulcanide."

The mechanical operations in all classes of the work are performed by dies, stamp-presses, punches, lathes, drilling apparatus. Many improvements adding to rapidity of production, labor-saving and ingenious, are being made almost weekly, the inventors being those practically connected with the mechanical labor in different factories, the knowledge of which is generally confined with the firm it benefits.

Buttons without shanks are of two kinds, the first being discs of horn, bone, wood, or other material, having holes drilled through the center. Horn buttons of this class are made from cattle's hoofs, generally by heating them in molds. They are dyed black by being submerged in vats of logwood and copperas. In casting buttons impressions of the patterns are taken in sand, the shank being inserted in the center of each impression projecting a little above the surface of the sand, the molten metal is then poured over the mold and afterward trimmed and polished.

Glass buttons are formed of compressed glass while in a fluid state run into molds, in which the shank is inserted, and when the glass solidifies is held firmly in place. In inserting the shanks of mother-of-pearl buttons a hole is drilled in the back, and it is driven in by a steady stroke. The silk button superseded the gilt, and the Florentine manufacture was not only very interesting but very complicated (quite too much so for a popular description), and the silk button so-called nearly drove the gilt out of the trade.

For the manufacture of pearl buttons the principal sources of supply of material are the Indian Archipelago, Pacific waters off the coast of Mexico and some of the South Pacific islands, and the Australian waters. The mother-of-pearl taken from the shells of oysters and the mollusks is found chiefly in the waters of the Indian and Pacific oceans. The Azores furnish the pure pearl in large quantities. These isles are abrupt formation of limestone where the precious shells are found in unlimited quantities, being known in the trade as the tripong and the holothonian varieties. Mother-of-pearl or nacre, is the silver lining of the Indian Ocean oyster shell. The genus of shell-fish lintodinæ furnishes the finest mother-of-pearl, as it does the best pearls, and is found on the coast of Ceylon near Ormus in the Persian Gulf. The finest variety of pearl shells are known in the trade as flat shells and ear shells, while the "gem shells" are called the "Bombay."

The Mamilla shell has a fine yellow edge. The Haliote's, which is found in Pacific waters, is a beautiful dark-green pearl, while those from Bombay and Valparaiso are all varieties with dark edges. One of the oldest shell importers now living in New York says that where he expended one hundred dollars a few years since in the importation of fine shells, he now expends eight and ten thousand dollars annually for the pearl button manufacturers, and that within ten years the demand for this class of material has increased very largely.

The most extensive manufactories of these buttons in the United States are located in Philadelphia and Newark, New Jersey. To and from the islands of Madagascar and New Guinea go and come the shell-gatherers, their great ships loaded with rough incrustations which, after passing through the hands of skilled artisans, are to reflect all the colors of the rainbow and the delicate tints of the clouds.

The late fashionable demand for "smoked pearl" has given a new interest to the pearl button work. The quantity of pure smoked pearl from the genuine dark-eared shell available is less than one-third the supply, and the demand is so great that the price has advanced above the fine white pearl. To meet this "smoky" demand a California shell known as the Abalone came into market, and is now the principal supply for darkly tinted stock. In the production of smoked pearl buttons the Abalone and conch shell are most used—in white shells, smoked by special process, the Manilla and Macassar are used. The rarest natural dark pearl shells are found off the coasts of Madagascar. These are very rare, the shell is thick and heavy, its concave interior pure white until within an inch of the outer edge; then it becomes almost black, shaded toward the white center to a light smoke tint. The Burgos button, a new pearl variety from the conch shells, is capable of a very elegant finish.

Only one pearl button manufacturer, A. B. De Freece, received a medal at the Centennial Exposition; but at the last Paris exhibition there was an exhibit of a superior hand-made and hand-carved stock of pearl goods, which attracted so much admiration for exquisite skill, Mr. De Freece conceived the idea of bringing to this country French artisans, the most expert in the world, to combine the production of this class of work with his already established industry. This was successfully executed, and it reflects credit upon the taste of American patronage as well as upon the enterprise itself. A cheap substitute for pearl buttons made by compressing clay into molds was attempted a short time since, and with it the experiment of superseding the horn button by a mixture of vegetable fiber and resinous matter.

One of the greatest novelties in pearl buttons is the inlaid stock—pearl inlaid in horn, jet, wood, and other materials in all devices and designs, some of them of great artistic beauty. The process is simple, being a part of the stamp-press work employed in all metal or composition works. In 1878 a new material was introduced into the country from Saxony, being a peculiar variety of marble, gray and brown, or umber and steel, four shades of each, and all susceptable of a high polish. The colors harmonize with some of the new shades and dyes in dress goods, which adds a greater value to the button.

The most interesting progress of the button-making industry is seen in the sleeve button branch. The elegant work in pearl, ivory, shell, agate, bloodstone, and other materials successfully rivals all foreign importation. In August, 1879, the non-separable sleeve button was patented and the patent purchased by R. M. Tripp & Company of New York. Then followed a unique separable patent that excels all others. The demand for this novelty exceeds all others made by the firm. The stock of pearl, sardonyx, and moss agate sleeve buttons manufactured by that firm is equal to the best of foreign workmanship, and the new patents place the American industry in this speciality far ahead of its European competitors.

The rubber button manufacture in the United States is represented by the Novelty Rubber Company of New York, whose factory is located in New Brunswick, New Jersey. The rubber button is not classed among inventions, but is only an application of new material to button manufacture. The daily production is about one thousand gross, and four hundred and fifty operatives are employed, two-thirds of whom are females. The styles produced are unlimited. This company was the first to commence the business and it is the only considerable one engaged in it in the United States. The only serious rival to the rubber button is the latest invention, called the "blood

button." The value of the discovery is equal to its novelty. The "blood" button is the utilization of animal blood, the process of which is entirely a Chicago industry. In 1875 a gentleman by the name of Grenaille discovered that animal blood was capable of being greatly solidified. He accordingly spent a great deal of time and money in making experiments, and by patient labor finally brought his ideas to such practical shape as to utilize blood in the light manufactures, the principal one being buttons. Mr. Grenaille had not sufficient means to invest in the manufacturing interests of his invention, and it fell into the hands of W. S. Palmer, Jersey City, who is the sole owner of the patent, and the only manufacturer of blood buttons in the world.

A few hours in this factory gave the general information desired concerning this new enterprise. The material is pure animal blood, prepared by a dyeing process, and the source of supply is Chicago's great cattle-yards. When dried, it is cut, stamped, and drilled at the factory in Jersey City by similar methods used in other materials, save that it is subjected to compound lever pressure. The buttons are all drilled buttons, or buttons without shanks, finished with a high polish and every way a very handsome production. When finished it is black in color, light as paper, and smooth as ivory. Buttons can be made of this material very much cheaper than the rubber, and are well adapted to both men's and women's wear. It is capable of being produced in colors, but so far it has been made only in black.

In 1871 the Lock-Shank button company was organized in Brooklyn. The principal feature of interest attached to this part of the industry is the labor-saving result acquired in setting on buttons; it supplants that aggravating annoyance of "sewing on buttons," a bit of domestic experience that has tried the patience of many a good mother.

The shoe button shank is one of the most important in the list of manufactured buttons. The largest factory is in Massachusetts. The largest and most recently established cloth button factory in New York is the Manhattan Company's Works, on Canal Street. Organized in July, 1879, they are already producing two thousand gross daily in five hundred different styles. One of the novel features of their work is a combination of three fabrics in one button; namely, silk, velvet, and worsted, which throws upon the fashionable market some of the most elegant goods worn. All of this work is performed by machinery, and the great factory employs one hundred and thirty operatives. The vegetable ivory button is made a specialty in several cities and factories; it is also manufactured by firms which produce other varieties. The main sources of supply of material are Brazil and other South American states, the ivory being a nut growing on a species of palm tree. Imitations are made of mother-of-pearl, of tortoise shell, and lapis lazuli, by several chemical processes invented in Paris and East Austria. The fine silver belly-scales of the white fish are used in the imitation process, which, as a chemical industry, is quite as wonderful as the most intricate work of manufactured articles of pure material.

This American industry of button making, that less than a century ago was not in existence, now covers a manufacturing interest valued at three million dollars in annual production. In Connecticut there are twenty-nine large factories. In Massachussetts twenty-one, in Philadelphia the largest pearl factory in the world, in New York and New Jersey over forty factories, are constantly running. One of the most important features of this whole business is the development and utilizing of hitherto worthless materials in the industry, so giving to it a domestic supply of the raw materials. The importations are confined to two or three classes of materials, while all the remaining portions are supplied from our own resources. Companion to this is a noteworthy record of the remarkable development of inventive genius and skill that has perfected the rapid growth of the industry that is truly wonderful, but in keeping with the spirit and effort of the age. And just here the question arises, which nobody can answer, what becomes of all these buttons?

OLD ENGLISH TRAVELERS IN RUSSIA.

THE collections of worthy Hakluyt are a perfect treasury of information of voyages, travels, and adventures. A society bearing his name and inspired by his example, the Hakluyt Society, from time to time publishes similar collections, enriched with valuable annotation. Mr. Bond, the newly appointed keeper of printed books in the British Museum, has edited a narrative of one of the early travelers in Russia. There are several of those travelers whose narratives are replete with interest. We propose to bring together some interesting notes from writings contained both in Hakluyt's collection and those published by the Hakluyt Society. In these old writings we find some interesting touches of personal adventures, some curious and little known passages of English history, and we shall all the better be able to understand the ways of the Russian people at the present time if we know their antecedents.

It is about the middle of the sixteenth century that we hear of the great Muscovite Company, and of the doings of their captains and mariners. We may combine some of the more scattered notices before we proceed to the regular narratives. One worthy captain goes so far north as Lappia. "There came aboard us certain Lappians in a boat to the number of sixteen persons, and amongst them there were two wenches, and some of them could speak the Russe tongue. They told me they had been to seek meate among the rocks, saying: 'If we get no meate we eat none.' I saw them eat rock weeds as eagerly as a cow doeth grass when she is hungry. I saw them eat fowls' eggs raw, and the young birds also that were in the eggs." We think it best to modernize the spelling, although the Vandyke looks best in its ancient frame. Then one Mr. Anthony Jenkinson, sent on an embassy to the czar, himself gives an account of his reception and entertainment by that potentate: "The emperor sent me divers bowls of wine and mead, and many dishes from his own hand, which were brought me by a duke, and my table served all in gold and silver. When dinner was ended, the emperor called me by name, and gave me drink with his own hand, and so I departed to my lodging. The emperor never putteth morsel of meat in his mouth but he first blesseth it himself, and in like manner as often as he drinketh, for after his manner he is very religious."

Some of his accounts of the old customs of the Russians are very amusing, and are corroborated by other travelers. Their curious religious customs have never greatly varied. At the present day nearly every Russian family has its Ikon, which is a picture, with something of an image interwoven with it. For instance, there is the picture of a saint in a household often enough at the present day, with a metallic aureole affixed to it. Our old traveler asserts that the common Russians took their images for gods. Even then their priests were married; but when the wife died the priest was not permitted to marry again. The account of their baptisms is very quaint. There is a table put into the middle of the church, "and on it an earthen pot, full of warm water, about the which the godfathers and godmothers settle themselves; then the clerk giveth unto every one of them a small wax candle burning; then cometh the priest, and beginneth to say certain words, which the godfathers and godmothers must answer word for word, among the which is that the child shall forsake the devil, and as that word is pronounced they must all spit at the word as often as it is repeated."

Their marriage customs are highly curious. "When there is love between the parties, the man sendeth unto the woman a small chest, wherein is a whip, needles, thread, silk, linen cloths; thereby giving her to understand that, if she does offend, she must be beaten by the whip; by the needles, thread, cloth, that she should apply herself diligently to sew," etc. After the

wedding "they begin to drink, and first the woman drinketh to the man, and, when he hath drunk, he letteth the cup fall to the ground, hastening immediately to tread upon it, and so doth she; and whether of them tread first upon it must have the victory, and must be master at all times after." He reports that the women sew well and embroider excellently. The husband is bound to find his wife in cosmetics, of which the wives make inordinate use "without any shame. I can not so well liken them as to a miller's wife, for they look as though they were beaten about the face with a bag of meal, but their eyebrows they color as black as jet." "The Russians do not have the credit of treating their wives in the best way. They consider that it is within their rights to administer personal castigation, and if the castigation is not administered, the wives consider that they have lost their hold upon the affections of the husband. For some days after the marriage the bride must not be heard to speak, save certain few words at the table, in a set form, with great manners and reverence to the bridegroom." If she behave herself otherwise it is a great prejudice to her credit and life ever afterwards, and will be highly disliked of the bridegroom himself, who will probably administer personal correction.

Hakluyt gives an account of six expeditions which were sent from England to Russia. In the days of Ivan the Terrible, whose frightful atrocities suggest the charitable idea that he must have been mad, and of Queen Elizabeth, there was a great tendency to draw close bonds between England and Russia. England wanted the monopoly of the Russian trade, and Russia wanted the alliance of a great maritime power. The Hakluyt Society takes up the narratives where Hakluyt leaves off, supplementing their information, and has disinterred various state papers and curious biographies. One Horsey was a clerk in the service of the Russian company in Russia, and Ivan employed him as an agent to proceed to England. He wanted to marry an English lady; and he even aspired to the great Elizabeth herself. It was resolved that the lady Mary Hastings, the queen's own niece, might probably prove a suitable match for the czar. It was quite true that the czar labored under the trifling disadvantage of being married already; but he hastened to explain that his wife was not of royal birth, and he was entirely prepared to repudiate her. Lady Mary got the nickname among her friends of Empress of Muscovie. On the whole, however, she was not satisfied with "the tricks and manners" of her imperial admirer. She persuaded Queen Elizabeth to allow her to decline the dangerous honor. Ivan got into a terrible passion because Queen Elizabeth did not meet his wishes. He entirely lost any good manners which he might have been supposed to possess, and told the embassador "that he did not reckon the queen of England to be his fellow, for there are that are her betters." The embassador manfully answered that "the queen, his mistress, was as great a prince as ever was in Christendom, equal to him that thought himself the greatest, well able to defend herself against his malice whosoever."

Besides the narrative of Horsey we have a narrative by one Giles Fletcher. He bears a name illustrious in English literature, being the father of Phineas Fletcher, the author of "The Purple Island;" and his brother, bishop of London, was the father of John Fletcher, the illustrious dramatist. He acted as embassador between the times of Horsey's employments, and in several ways they are found together. He published a narrative or book about Russia, which the Russian company caused to be suppressed on account of its plain speaking. It is this book which the Hakluyt Society has resuscitated. Fletcher thought himself well out of a lion's den when he got back to London; "for the poets can not fancy Ulysses more glad to be come out of the den of Polyphemus than he was to be rid out of the power of such a barbarous prince." Old Fuller perpetrates the curious bull of saying that, if the czar had cut Fletcher's head off, Fletcher would in vain have sought for any redress. It is very difficult to see how he could have sought for any redress at all if

his head had been taken off. Giles Fletcher loved Russia in the Summer. "You shall see such a new hue and face of a country, the woods—for the most part which are all of fir and birch—so fresh and so sweet; the pastures and meadows so green and well-grown—and that upon the sudden; such variety of flowers, such noise of birds—specially of nightingales, that seem to be more loud and of a more variable note than in other countries, that a man shall not lightly travel in a more pleasant countrie."

But however pleased he may be with the country, he gives a frightful account of misgovernment and cruelty. The law of debtor and creditor was as bad as the old Roman law, which allowed the debtor to be cut up bodily by his creditors. If the alleged debt were only for a sixpence the debtor was chained leg, arms, and neck; if the case were given against the debtor he was daily cudgeled about the shins and calves by an officer till the money was paid. "You shall see forty or fifty stand together all on a row, and their shins thus becudgeled and bebasted every morning with a piteous cry." If the debt is not paid after a year's cudgeling, he, his wife, and his children, and all that he has are sold. Death, with shocking varieties of suffering, was inflicted for all sorts of criminal offenses; by the knout, by torture, by roasting, hanging, beheading. "But, for the most part, the prisoners that are condemned in Summer are kept for the Winter, to be knocked on the head and put under the ice." This was the case only with the poor serf. If a lord killed his servant "little or nothing is said unto him, at the most only a small fine." With regard to other crimes, "if a murder or theft be committed, peradventure he shall be imprisoned at the emperor's pleasure." He gives a wretched report of the life of the people: "They make no account of the life of a man. You shall have a man robbed sometimes in the very streets of their towns, if he go late in the evening, and yet no man to come forth out of his doors to rescue him, though he hear him cry out."

Fletcher gives a curious account of the emperor's way of celebrating holy days. His favorite amusement was to watch a bear-hunt, that is, a fight between bears and bear-hunters. "But many times these hunters come short, and are either slain or miserably torn with the teeth and talents [that is, talons] of the fierce beast. If the party quit himself well in this fight with the bear, he is carried to drink at the emperor's cellar-door, where he drinketh himself drunk for the honor of Hospodar. And this is his reward for adventuring his life for the emperor's pleasure. When it draweth towards bed-time, his priest sayeth certain prayers; and then the emperor blesseth and crosseth himself as in the morning, and so goeth to his bed." Fletcher at first found himself treated cavalierly, but after the defeat of the Spanish Armada he experienced great politeness.

Sir Jerome Horsey appears to have possessed a great deal of versatility of character. Passing through Poland, he appeared at court in the disguise of one of his own servants, and when he was detected every body took it pleasantly. Horsey describes the last days of that terrible old tyrant, the Emperor Ivan. He sent for sixty witches out of the north countries, where there was great store. The dying man pointed out his jewels to the courtiers, and told them of the hidden virtues of his jewels, diamond, jasper, and sapphire. Horsey speaks of his reign as the "smothering time of tyranny." He gives an account of the splendid cheer which was afforded him in one of his embassies. They sent him for his provision, "twenty live sheep, twenty live oxen and bullocks, six hundred hens, forty flitches of bacon, two milch kine, two goats, ten fresh salmon, forty gallons of aqua-porter (beer), one hundred gallons of mead, two hundred gallons of beer, a thousand loaves of white bread, threescore bushels of meal, two thousand eggs, and a store of garlic and onions." Notwithstanding the richness of his entertainment, Horsey was glad, to get away from his embassy, and, moreover, he was "betrothed to an honest gentleman's daughter of Buckinghamshire."

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE ANNUAL CONFERENCES.

THE magnitude to which our American Methodism has attained is causing its greatest embarrassment. At the beginning it assumed a form and shaped for itself conditions suited to its then existing circumstances and wants. But after a growth of unexampled rapidity, extending over more than a hundred years,—and after a career of more than seventy years since the latest readjustment of its organic affairs,—which regulations were at first well adapted, and thoroughly effective, to the infant Church, these things have become unadapted by the changed conditions of things to the requirements of the case. This is especially the case with our annual conferences. These bodies, which were then few and feeble and composed largely of young men fresh from the farm or shop, are now of a very different complexion, and would not suffer by comparison with the most honored clerical assemblies of Christendom. For such bodies a different mode of treatment is needed from that which at first sufficed.

It is admitted on all sides that the present status of the annual conference is anomalous and unsettled, and that certain changes are necessary in order to adapt it to changes already adopted by the Church and to present needs and conditions. The last General Conference took some action looking toward the introduction of laymen into these local conferences, and the prospect is that within a few years this reform, if it be a reform, will have been accomplished in the Church. Reform is not revolution. Genuine reform roots itself in the past, and is the adaptation of existing institutions to changed conditions and fresh convictions of a living people. A fruit tree can be improved by culture and grafting. It can not be improved by plucking it up by the roots. And the grafts should be made on the smaller branches, and not on the main trunk.

The spirit and theology of Methodism are persistent, for which we may devoutly thank God; but its methods of government and administration have frequently been changed. Another change is demanded to-day, namely, the exaltation of the annual conference by increasing its powers and functions. Our Church is too vast, the needs of far separated conferences are too diverse, to be wisely cared for by a single legislative body. We need more local self-government, whereby local interests can be better cared for than they are at present. We need to bring every preacher into direct relation with and responsibility for the law making of the Church. And this can be done without impairing in any degree the connectional unity of the Church.

Dr. Sherman, in his Introduction to his History of the Discipline, writes: "At first a centralized, and, to some extent, a conservative system, the policy of the Church has yielded to the influence of a genial and free atmosphere, to the gentle yet plastic touch of our civil institutions, until the genius of the Church has become assimilated to that of the state." Surely the doctor has put the case a little stronger than the facts warrant. To a certain extent this assimilation has been accomplished, but contrast is suggested rather than comparison when we put our Church and the state together.

If there is one feature of our civil government more fundamental than any other, it is that of local self-government. Our Republic is a synthesis. A few weeks ago we had town meetings in this Commonwealth of Connecticut, and every town had its part in regulating its own affairs. Every town in New England is an empire,—*imperium in imperio*. We need not to be told by De Toqueville that this pre-eminent American feature of our government is the source and bulwark of our liberties. But in this matter of local self-government the

Methodist Episcopal Church is certainly not yet fully assimilated to the genius of our civil institutions. Centralization, tremendous power at the center, is the most obvious feature of the government of our Church. And by the center we mean the episcopacy and the General Conference.

The difference between the constitution of the Methodist Episcopal Church and that of the United States has often been pointed out. The powers of Congress are specific and carefully defined by statutes. All other powers are retained by the States. The powers of the General Conference are conveyed by an omnibus clause,—"full powers to make rules and regulations for our Church," barring a few restrictions—themselves not guaranteed against constant encroachments.

The strength of our Church is in her traveling ministry. Our itinerant system gives to the preachers a power towards the Churches which the pastors of other Churches can not possess. And Methodism does not depend upon her great men, but upon the average Methodist preacher, with his Christian character, his prophetic impulse to preach the Gospel, and his knowledge, as Gideon Ouseley used to say, of "the disease and the remedy." These itinerant preachers always have constituted, and so long as our system retains its essential features always will constitute, the efficiency and glory of our Church. All the geniuses and great men of the Church might be translated to heaven in a single night, and it would hardly jar or disturb her efficiency. We would still hear of revivals and conversions, and the work of smiting Satan and saving souls would still go forward. Whatever, therefore, increases the efficiency of the average Methodist preacher is of the very first importance and concerns intimately the welfare of the Church. Whatever affects the self-respect, the sense of obligation and authority, the dignity and devotion of the eleven thousand ministers of our Church must be of immeasurable importance. Self-government is intimately related to character and life.

Now is it not a fact that the average Methodist preacher has practically no part in the government of his Church? The Church is governed for him, her laws are enacted for him, by somebody else. There is a body called the General Conference, of which he has heard by the hearing of the ear, but a sight of which has never, perhaps, blessed his eyes; of which he no more dreams of ever being a member than he dreams of representing his State in the nation's Senate; and that body is the law-making power of the Church, the fountain of all legislative, executive, and judicial authority. According to Dr. Hamline's great speech in the General Conference of 1844,—a speech which the writer was taught to receive as a correct statement of Methodist law and polity, but which it seems now to be the fashion in some quarters to sneer at,—the General Conference is absolute master, or nearly so. It can do no wrong; an error is not a legal presumption, and if it err, it alone can cure the error. "The General Conference is the sun of our system," said Dr. Hamline in that famous speech which made him a bishop; but it is a sun as far removed from the average Methodist preacher as is the literal sun above his head. It is true that he votes for the members of that body, but it would be a misuse of words to say that he is always represented by the men whom his votes helped to elect. Quite often he is misrepresented by them. Some conspicuous cases of this kind have occurred so recently that they need not be named to be recollected, and for such misrepresentation there is no redress.

The truth seems to be that in a Church it is, as a rule, impracticable to raise distinct issues, or erect platforms, as is the custom in the political world, on which delegates must stand. The best that can be done is to elect men, and trust to their judgment and honor; and if they were chosen by drawing names from a hat, we would perhaps be as fairly represented as we are with our present methods.

And thus it comes about that the Church is governed *for* us who constitute the rank and file of the ministry, and not *by* us.

All this evil would be avoided, or at least much of it, by requiring that every considerable disciplinary change should be submitted for the approval of the annual conferences before it could become a law. It is neither just nor wise that serious changes should be made in the government of the Church, and the great body of the ministry have nothing to say about them. If they are to execute the laws, and also to be governed by them, they ought to have some part in making the

laws. Why should the itinerancy be swept away, and the itinerants have nothing to say about it? Why should the method of appointing presiding elders be changed without asking the opinion of the general ministry? Why should new conditions of membership be imposed on the Church without the consent of the men who are to enforce those conditions? "Full powers to make rules and regulations," is too big a grant by far for the best interests of the Church to-day. In 1844 it permitted the division of the Church. In 1868 it was interpreted by a majority of the General Conference to permit lay delegation. The restrictions on that grant of power are few, and in the actual working of the Church these few have proved to be very feeble.

Let every new measure that changes the governmental methods of the Church, or affects the standing of the ministry or members, be submitted to the annual conferences, and let a majority vote of the conferences be required before such measure becomes law.

Can any good reason be given why every Methodist preacher should not have a voice in the law-making of his Church? Is the rank and file preacher, who will never sit in the General Conference, too ignorant to be trusted with a vote? Is his experience or his piety so deficient that he must be kept under the tutelage of more favored brethren? Or is the General Conference so fortunate in its membership, and in its conditions for wise legislation, that nothing can be lost by excluding the co-operation and judgment of the eleven thousand members of the annual conferences?

A more urgent reason for the reform here advocated is the influence upon every preacher which would result from direct personal responsibility for the Church. It would require a careful study of our system. It would bring about a closer sympathy with the Church and a better knowledge of its book of discipline. It would result in more uniformity of administration. It would compact the connectionalism, and strengthen the loyalty of the Church.

In our early history, every preacher had a vote on all matters in the Church. And Asbury refused to be a superintendent on Wesley's appointment without an election by the men over whom he was to rule, and whose appointments were to be made by him. But we do not vote for the men in whose hands are our destinies and those of our families, nor are they responsible to us, who sit in the annual conferences, for any thing they may do.

They are put over us by a body in which we never expect to sit, and upon which we can have only the feeblest and most remote influence. Even in the Protestant Episcopal Church, with its hierarchical elements, every minister has a direct vote as to who shall be his bishop. But the poor boon has thus far been withheld from us of even nominating the presiding elders, whom custom has made the stationing committee.

And this is a change that would be conservative in its practical working. Among Asbury's reasons for desiring a delegated conference in 1808 was his solicitude lest the General Conference as previously composed of all the preachers, and therefore possessing absolute power, would do some unwise thing, or overturn some great institution of Methodism. As a conservative measure, he favored a delegated conference with curtailed power. But since power must reside somewhere, it still remains practically with the General Conference when in session, and at all other times with the episcopacy. A single legislative body with vast powers is always exposed to the temptations of sinister influence or hasty deliberation; but no fear of radicalism can be entertained when ninety separate bodies must pass upon a measure before it becomes law.

An objection may be raised that this scheme would fetter and cripple our Church; that we live in a rapid age, and sometimes need prompt action. But surely if a change in any important interest of the Church is needed, the ministers of the Church, who love her and serve her, may be trusted to see the necessity. Besides, Methodism is not now in its formative stage. Our institutions are tolerably well matured. After a hundred glorious years of life we are not in our swaddling clothes. And the vast interests involved call for cautious and well-deliberated action.

The administrative functions of the annual conferences also ought to be enlarged. They should have a certain independency in managing home interests, and in regulating the Churches within their bounds. The permanency of our far-extended Republic will be due largely to the principle of local self-

government, which inheres in our system of sovereign States and towns. Mississippi can afford to remain in the Union so long as the men of the Pine-tree State can not force upon her the laws and social customs of Maine.

Our Church belts the world, and in view of the varied conditions of far-separated portions of our work, what good reason can be given why these separated conferences should not have considerable authority for managing their own affairs? Why should the Colorado Conference be forced to the same methods and regulations as the New York Conference? Why should not the conferences in India and China be permitted considerable latitude and departure from the usages of a home conference?

For example, in the older portions of the work a conference might vote to make the presiding elders chairmen of districts, while on the frontiers the old method would be most efficient; and why may not the several annual conferences have some voice in ordering this measure?

As preachers we have often felt the need of more intimate relations between the conference and the Churches within its bounds. These Churches are practically independent in any of our assemblies. There is neither presbyterial nor episcopal authority over them. They may run into debt to their financial ruin, they may build unwisely, they may mortgage their property for current expenses and consume the heritage of the past, they may separate into factions and become embroiled in quarrels, but the conference can not come near them either with counsel or restraint. Every old conference has its monuments of this mischievous defect of our system in churches deserted or sold for debt, or in churches crippled by mortgages.

It is both blunder and crime that two opposition Methodist Churches should exist side by side. This is, indeed, the very worst form of schism. In the Presbyterian Church every presbytery has jurisdiction over all the Churches under its care, so that these evils are in the main prevented, and the result is a well-knit, compact, efficient, and loyal Church. And there are peculiar reasons why a Methodist conference should have this care over its Churches. Our system of change makes the preachers collegiate pastors. At the next session of conference each preacher may be sent to any one of the Churches.

If it be said that the presiding elders should do this work, it is sufficient reply that they have failed in the past, which is sufficient proof that they lack the moral and legal power to make their advice effectual, and that they represent a power for which the Churches neither feel nor possess responsibility.

To make this conference oversight practical and beneficent, it would be required that laymen should sit with the preachers in the annual conferences. That measure must, indeed, very soon be inaugurated by the Church. It is needed to give us genuine lay delegation, and not simply a lay aristocracy, where rank or wealth secures the prize of the suffrages of the crude lay conventions of to-day.

Critics of our polity are sometimes called meddlers and trouble-makers; but surely it is worth remembering that while our Church has been famous for its unity and peace on doctrinal questions, it has been equally famous or infamous for its agitations and secessions on ecclesiastical issues.

Our Church has been in a jangle from the days of O'Kelly, and even earlier, on questions of polity. Slice after slice has been taken from us. Church after Church has been established by the seceders, while zealous, humble, and god-fearing ministers have submitted in silence, though not satisfied, rather than cause agitations. Is it not just possible that the chief cause of these troubles is our lack of distributed power,—our over-centralization? A pyramid is a difficult structure to throw down, for the simple reason that it has a broad base. We have the fallacy which the logicians call "an undistributed middle." Europe is honey-combed by communistic societies to-day, because the people have no share in the law-making bodies. In our land these pests do not flourish. There is no material to feed the wild fire. The emissaries of communism from Berlin and Paris find the people unprepared for them. The antidote of European communism is the universal ballot. If there is a grievance, there is a remedy. There is no governing aristocracy. And from these things we may learn what are the wants of our ecclesiastical system. J. P.

FOREIGN AFFAIRS.

WHAT WE KNOW OF BABYLONIA.—Some lectures on the literature of Babylonia by the Rev. A. H. Sayce, just printed in London, furnish much fresh information on this little understood subject. Every great city of Babylonia had at least one library; but their contents are still largely unknown, nor will much be learned until excavations bring the remains of the libraries to light. Almost all that is known of ancient Babylonia and Assyria, was derived, says Mr. Sayce, from the contents of a single Assyrian library at Nineveh, two-thirds of which is now in the British Museum. That library was founded by Sardanapalus, the son of Esar-haddon, who was distinguished among kings for his patronage of learning. Some of the earlier libraries of the country were merged into this one, and scribes were employed to copy and re-edit the old Chaldean literature, so that a new text became the most valuable present a Babylonian city could send to Nineveh, and it was prized with about the same ardor as a classical manuscript in the time of the Renaissance. A large part of the literature of Assyria was derived from Babylonia, from which it is reasoned that the Assyrians were not a literary people, but a nation of warriors and legislators, like the Romans after them. Their literature had its inspiration from Babylonia, just as the Roman had its from Greece. The libraries of Assyrian cities were founded in imitation of those in Babylonia, and such art and learning as they possessed came originally from their southern neighbors.

MR. GLADSTONE'S PERSONNEL.—He is a tender father, a devoted husband, a true and good friend. His disinterestedness about money matters is so great that he refused an augmentation of his salary whilst prime minister, and left office impoverished. He had to sell a goodly collection of china, which he had amassed (for he is a connoisseur), and soon afterward his library of books, which was bought back for him by Lord Wolverton. His readiness to succor all who appeal to his charity is only limited by his means, and frequently he returns from a country walk with his pockets cleaned out, thanks to his distributions of gold and silver among the sick or needy villagers. Some months ago he went out for a walk of about twelve miles, intending to return to Hawarden by train; but in the evening he found he had given away every thing, and had not money left to pay for his ticket. So he trudged home on foot, arriving so late his family had become uneasy. Mr. Gladstone does more than give money away, for he has often been known to go and read the Bible to tenants who were bedridden, and this mission of charity he has always discharged in the most natural, unostentatious fashion, even when he was prime minister and had work enough to occupy all the moments of such a sturdy toiler as himself. He is in truth a most fervent Christian, and the explanation of much of what is wayward in his character may be found in his deep religiousness. His wrath is generally righteous wrath, if one may so call it.

ADVANTAGES OF ORIENTAL COSTUME.—When the European first beholds the Orientals in their strange attire, there is a suppressed smile playing on his lips, and a look akin to pity hidden in his eye. And yet there is a great deal of philosophy of the Oriental mind expressed in the garb wherewith he clothes himself. The flowing robes and loose white cloaks worn by him in Summer are more effectual in keeping out the sun than our own tight-fitting garments; and for a like climatic reason they have made choice of a head-dress which affords the best protection possible against sun-strokes, so common in the Eastern countries. The stagnation of the blood, which produces sun-stroke, may occur in any part of the body, and sometimes attacks the knees when exposed with a tight-fitting covering, especially in riding. The nape of the neck is, however, the most dangerous spot, and all Eastern head-dresses cover it. In Morocco, the natives will, however, face a fierce Summer sun with only a grass fillet round their temples, the top of the head being exposed. This fillet is bound tightly, and passes over the base of the skull at the

back. In the same way the Syrian head-dress, called *kufeyeh*, which is worn by Christians, by horsemen, by the Bedouin, and by the native regiments—in fact, by all who are most exposed to the sun—consists of a shawl bound round the temples by a fillet. A felt cap is often worn under the shawl; but the main object of the head-dress is to cover the nape of the neck, and to give a tight ligature round the head. The action of this fillet can only be properly accounted for by a physician. The fact remains that it forms a most efficient protection against sun-stroke.

THE RESTORATION OF THE JEWS.—Sir Moses Montefiore, in pursuance of his plan to restore the Jews to Palestine, has ordered the land in front of the Judah Torah houses in Palestine to be prepared for cultivation. "The rocks will be removed, terraces built all along, as it used to be in the time of King Solomon, and divided into twenty-two partitions, so that every inmate may cultivate the necessary vegetables for himself and family. Sir Moses has also caused a very large cistern to be constructed in the center of the field, which will secure a full supply of water for all of them. There will be a beautiful veranda in front of all of the houses, so as to protect the inmates from the glare of the sun. The veranda was sent direct from London. He has also had a new entrance made in the center of the boundary wall, built a lodge for a watchman, and had a large bell affixed to one of the houses, to give the alarm in the case of emergency." A German paper is authority for the statement that the Rothschilds hold, among other securities for a loan of two thousand million francs to the Sultan, a mortgage on the entire land of Palestine.

FRANCE SAVED ONCE MORE.—So may we say truly. Communism is a rank weed in the beautiful garden we call the French Republic of 1879. Blanqui and Cassagnac are both cultivating the troublesome vines on which hang the sorrows of an eternity. But the good sense of the French people has made of no effect the villainous efforts of this Cassagnac, who dared to make his boast the other day that he had incited the Bordeaux Bonapartists to vote for Blanqui, and the prompt refusal of the Chambers to sanction the election of the radical Communist, shuts the door of the legislative halls to him at an hour when the gates of exile shut upon him, and his own father-land bids him a hearty welcome, though he be unworthy of her favors. This Blanqui has been a most troublesome fellow to his countrymen. In 1870 he led the rampant Communists of Paris, and was instrumental in the destruction of millions of property at the capital. To-day he stands elected a representative of the same class of people with whom he then associated, and though the ministry of the new republic cuts his bonds and sets him free despite his dangerous tendencies to society, the Chamber at Versailles has at least wisely decided that such a man is not their fit associate, and Blanqui's constituents must choose another to represent them. It is, however, really a query whether such people should be represented at all. It is very well to talk about a republic and the liberties it grants; but there is a class of people to whom license means liberty, and they need educating before they can be trusted with such heaven-born privileges.

RUSSIA'S POWER BEHIND THE THRONE.—That man who next to Prince Gortschakoff exercises the greatest influence on the foreign policy of Russia is said to be General Milutine, the minister of war. The *Augsburger Allgemeine Zeitung* has recently attacked his course, and openly denounced him as the instigator of the attacks of the Russian press upon Germany, and thus called general attention to Milutine. He is generally the companion of the czar, travels with him in the same carriage, goes hunting with him, and often converses with him alone and for hours. He dislikes the German race, and suspects Bismarck's policy. The repressive measures which, in the beginning of the reign of Alexander II, were taken against the somewhat expansive enthusiasm of the German element in the Baltic provinces, are known to have been inspired by Milutine. After the battle of Sadowa he changed the position of the Russian army so as to make it available for a sudden rush upon Germany—a fact which did not remain unnoticed, but at the time was capable of a friendly explanation. The circumstance, however, which has now suddenly concentrated public attention on him is his close connection with all those papers which

during the present press war have proved the bitterest enemies of Germany, such as the *Golos*, and the St. Petersburg *Vjedowoski*, etc. It would seem, however, that, despite Milutine's watchful care, Bismarck has succeeded in checkmating Russia's opposition, and by a close alliance with Austria, Germany has secured an inconquerable hold in the heart of Europe. It will be interesting to watch this Milutine for a while. He will start on a new road, and journey on to get ahead of Bismarck in the race if he can.

CONDITION OF ITALY.—Secondary education in Italy is still for the most part in the hands of priests, and educational institutions managed by the clergy. There are only one hundred and ninety-one schools—with some scientific schools—which are not connected with the Church. The upper schools are divided into gymnasiums and lyceums, the latter alone giving the final preparation for the universities. The report of the inspectors to the Italian University of Education says that education in the lyceums "is confined to logic and dialectics, explained and taught in the Latin language, and to the elements of mathematics and natural philosophy. Of the seminaries, one hundred and eleven have no university classes at all, forty-two cram all their university education into one year, eighty-eight spread it over two years, and only thirty-six are more or less arranged according to the three years university course prescribed by law." And why not? Can the Romish priesthood teach more than the elements of learning, and expect an obedient following? But Italy is waking, and the noonday sun will illumine this long-preserved darkness among the masses, and a new life will spring up, bringing out of this class of Italy's people a very different sort of representatives from those that now come to our shores.

THE SLAVONIC EMPIRE.—The elections for the first Eastern Roumelian parliament show which way the wind is blowing in the Balkan Peninsula. It appears that out of the fifty-six members who will sit in the chamber, all will be Bulgarians except six or seven—the Turks having the majority in the latter number, because in some places the Bulgarians have voted for and with the Mussulmans, while in nearly all places where the Turks knew they could not possibly return one of their own faith, they either abstained from voting altogether, or threw their weight into the scale in favor of the Bulgarian candidate. The governor-general has also the right of nominating a certain number of persons of all creeds and nationalities in the province to a seat in the assembly, besides which the law also ordains that all the religious heads of the various communities shall have seats in the new parliament. Thus the Bulgarian and the Greek metropolitan of Philipopolis, the Mahammodan mufti, the Jewish rabbi, the Catholic bishop, the Protestant pastor (for there is a small community of Bulgarian Protestants) will all sit together and take part, if they think proper, in the deliberations of the assembly. It will be a Bulgarian parliament, and a strong impetus will be given to the movement for national unity. And *àpropos* marches with this Slavonification and unification of the new Roumelia, the alliance of Servia, Montenegro, and Bulgaria, probably soon to be approved and strengthened also by Eastern Roumelia's accession. The Austro-Germanic alliance, though it may prove but an infant of a few days' growth, has come to be a fact, and the Slavonic nations of Southern Europe, feeling themselves endangered by Austria's inroads in Bosnia and Herzegovina, and knowing the ambition of the House of Hapsburg to enlarge its east-southern boundaries at their expense and to prevent the founding of a Slavonic empire, have only been stimulated to more speedy action; and the word as it comes across the cable forebodes the near approach of a new birth in the lines of empire and the next to be the empire of the *Slavs*. And why not? The time for national unions is *now*.

MARSHAL OZORIO, BRAZIL.—In the decease of Marshal Manuel Luiz Ozorio Brazil has lost one of her greatest characters. Although he had attained the ripeness of Biblical age, the Marquis of Herval seemed only primer for life's work. And yet his youthfulness at threescore years and ten was not the result of idleness. He had led a most eventful life and had kept a most restless activity from his youth up, and had gained his celebrity by his worth and his works. Of obscure parentage he entered the private ranks of the Brazilian army to advance from station to station until

at last he was regarded as the invincible soldier and the most gallant of generals. But what was far better than all, Marshal Ozorio was as loyal to his country as he fought with bravery for it. Brazil will honor his memory not only for his greatness, but also for his goodness, and the world will enshrine his great and excellent name as a holy relic for all men of all countries and all times. In 1864, when he was offered the leadership in a proposed revolution for the independence of Rio Grande, he forsook the "liberal party," which concocted the scheme, and stood firm for his country. In the Paraguayan war he fought from the first (1867) to the end of it in 1870, when he came home to be honored as we now honor Grant. Never before had Rio Janeiro given such brilliant receptions as were accorded to the Marquis of Herval, as he was named in honor of his services to Brazil. In 1878 he entered the Cabinet as Minister of War, and his popularity held the ministry to which he belonged in highest public esteem. As Henry Constable sang of Sir Philip Sidney, so may we sing of Marshal Ozorio:

"Courage, honor, makes thy soul to live,
Thy soul to live in heaven, thy name in tongues of men."

THE NORTH-EAST PASSAGE.—The North-east Passage is found at last! The golden dream of four centuries is finally realized. Spain, Holland, England, and Venice, all the great mariners of Europe failed to find it, but that little north-bound country, Sweden, sent its Professor Nordenskjöld to the Pacific by way of the Arctic Ocean and Behring's Strait about a year ago, and though he was ice-bound for nearly eight months at East Cape, he yet accomplished the task successfully. For discovering the North-west Passage, Sir Robert M'Clure was knighted and received a reward of $25,000; now what shall be the reward of this great Swedish navigator who satisfies the world's longing of four centuries?

ART.

DEATH OF PROFESSOR STARK.

ART and artists have suffered most sore loss in the death of Karl Bernhard Stark, Geheimrath and Professor in the University of Heidelberg. He died after a very brief illness on the 12th of October, at the age of fifty-five years. Mr. Murray, in the *Academy*, has the following notice: This event, so unexpected and so sad for his intimate friends, will be felt as a severe blow by the many whose interest was in the work he did—at the present most of all in his "*Handbuch der Archäologie der Kunst*," the publication of which, it was hoped, would proceed rapidly now that a beginning had been made after long years of preparation. How far the material of it may be in order, we do not know; but, unless it is well forward, the death of the author must be regarded as a disaster, since, just as no one but he could have undertaken the task, so no one else could finish it well. As early as 1852 he had shown the necessity of such a book by his "*Archäologische Studien zu einer Revision von Müller's Handbuch*," and in doing this had proved his capacity for the work. This was confirmed again and again by such articles as his "*Jahresbericht*," for 1873, in the *Philologus*, had such confirmation been needed by those who knew his "*Niobe und Niobiden*," his recent "*Festschrift*" on the portraits of Alexander the Great, or, to come to more modern art, his studies on Leonardo da Vinci and Dürer; for the duties of his professorship led him into these fields also. Of his great work, the "*Handbuch der Archäologie*," only half of the first volume has been published. It was to extend to three volumes, and these were promised in quick succession. Every one must deplore the loss of a life so useful. To very many it is a grievous personal bereavement.

To the closing words of this notice we can most heartily, yet most sadly, subscribe. To the many, many Americans, to whom Professor Stark had become very dear, this sad news of his removal from his most interesting and important labors will come with almost crushing force. He was a man of profoundest scholarship, not only in the department of investigation to which he had given the richest of his powers, but in other kindred and related subjects he had made such proficiency as to make the more ordinary scholar feel almost

ashamed of venturing an opinion. He was, moreover, a man of such kindly impulses, of such grand simplicity, and of such generous helpfulness to those who sought his advice, that many in America will mourn almost as if a father had fallen. It will be a special calamity to the art community of America, since arrangements had been well-nigh perfected to have an American translation of his grand work, "*Handbuch der Archäologie*," appear almost simultaneously with the German original. The art public will be anxious to learn in what stage of progress the fallen scholar has left a work which would have proved truly monumental.

CORREGGIO.

WITH the three great masters of Italian painting Correggio rightly takes his place. Inferior to these in the expression of the highest beauty and dignity, of grandeur of form and intensity of expression, he yet occupies the highest position as the creator of a new sphere in art of wonderful power and splendor. For, while art had reached its highest development in many directions, there were others in which it had not yet attained perfection. Correggio was endowed with a rare exaltation of feeling, an excitable and ardent nature, and an intense susceptibility. From this character grew both his choice and treatment of subjects. His works are full of nervous life and motion, and overflow with joyousness. His figures are bathed as in a sea of joy and ecstasy, filled with intoxicating delight, rapture, passion. Severity, dignity, even gravity are wanting; there is little rhythmical composition and the beauty that consists of harmony of line. He breaks all the laws of religious conception and artistic usage, to represent his figures in the expression of emotion and restless, outward, movement. Sacred tradition has no bonds for him; he follows solely the promptings of his own nature. He is distinguished by an intensely subjective mode of conception. His style is sensuous, voluptuous, at times almost wanton. He delights in portraying the rapture of a passionate love. In the same way he treats his religious subjects. His Madonnas and Magdaleines have the same dewy, melting, bewitching eyes, the same rapturous smile, the same seductive charms as his Danaë, his Leda, or Io. But he keeps his tone so pure and true that the passion is felt to be of heaven, not of earth—the highest state of paradisaic innocence. In this sanctification of human passion, this apotheosis of the rapture of love, Correggio pursued a path yet untrodden, and won a new kingdom for the queen of the arts. But not only this, he gave to painting a new medium of expression of marvelous delicacy and power. He is the first artist who wages systematic war against all flatness of surface, and in the struggle he discovered chiaroscuro, and brought it to a high degree of perfection. His pictures are filled with a light which is interwoven with delicate reflections and transparent shadows. Light and shade melt into each other through exquisite gradations; but the greatest brilliancy never dazzles, the deepest shade has nothing of gloom. Half concealing and half revealing his lovely forms, this chiaroscuro greatly heightens their attractions. Once discovered, Correggio employed it with enthusiasm. It became the one great instrumentality through which his art works. For this he sacrifices style, design, and grouping. All other things he casts aside for a composition in which effects of color may have their fullest display. And the beholder is induced to forgive all—is even silenced in criticism—by the indescribable charm of the result. "A picture by Correggio," says M. Taine, "is a sort of Alcinous's enchanted garden, where the bewildering seduction of light wedded to light, the capricious and caressing grace of waving or broken lines, the glittering whiteness and rotundity of feminine forms, piquant irregularity of faces, the vivacity, the tenderness, the abandonment of expression and action combine to form an exquisite and delicate dream of felicity, such as a fairy's magic and a woman's affection would prepare for a lover."—*The National Quarterly Review.*

INTERFERENCES OF THE AFFECTIONS WITH THE JUDGMENT IN MATTERS OF ART.

MR. HAMMERTON continues his characteristic "Notes on Æsthetics" in the *Portfolio*. They are full of quick wit, keen analysis, happy suggestion, and sometimes of profound insight. He has the faculty of making whatever he treats attractive to the reader, and leaves the student of his papers hungry for

the next installment. In the October number he has some very happy thoughts and illustrations on the "Interferences of the affections with the judgment in matters of art." "Affection interferes with our perception of art by making us prefer the inferior to the superior on account of some pleasant or pathetic association of ideas. The nation, the family, the favorite occupation or amusement, all these powerfully interfere with the justice of our appreciation of every thing in which beauty is concerned. . . . The popular mind does not analyze its preferences—it is incapable of establishing a distinction between what it can not help loving and what has claims upon its admiration. This incapacity may be found in minor degrees in intelligences far above the popular. We see it in the taste for scenery, when the sentiment of local patriotism fondly exaggerates the beauty and interest of the native land, while international antagonism exaggerates the defects of the neighboring country, and depreciates its merits. The remnant of old hostility is still strong enough between the English and the French to make them unjust in the æsthetic criticisms of each other's countries. The French opinion is that England is buried under perpetual fog, and an Englishman must be exceptionally erudite in geography to have got rid of his national belief that all France is flat and uninteresting. Few Frenchmen will admit, without resistance, that the Thames above London is as rich in beautiful lowland scenes as the best parts of the Seine or the Marne! The French have nothing to say about the climate of Denmark, because there is no international jealousy of Denmark; the English say nothing against the scenery of any minor state; but the jealousy between England and France finds vent in all sorts of mutual æsthetic criticisms. It chooses æsthetic criticism because in matters of taste there is always something unfavorable to be said; and it is not always so easy to prove its injustice as in a statement about trade or finance. The French say that the English have no music; the English say that the French have no poetry. It was a great advantage to the musical and dramatic artists of Italy that their nation used to be too weak and divided to excite jealousy—it gave them a much better chance of a fair æsthetic criticism in other countries than French or English artists would have enjoyed."

DUTIES ON WORKS OF ART.

RECENT bulletins of the Treasury Department contain decisions of Secretary Sherman upon certain art matters that are interesting. The customs officers of this port (New York) have charged a duty upon engravings printed in this country from an American plate, but sent abroad for the signature of the artist who painted the original picture. Appeal was taken to the Secretary. The decision was sustained on the ground that the engravings return in a different condition and with an increased value. This has led to the decision that foreign autographs, especially those of crowned heads, for collecting which some persons have a mania, ought not to be allowed the benefit of the free list, as they are at present, unless the receiver is prepared to make affidavit that they are not imported for sale. In Philadelphia Miss Sarah Hooker has been obliged to pay a higher duty on some pottery she imported because it had been decorated abroad, and so came under the head of decorated china-ware. In her appeal she set forth that this decoration had been made by an American artist, and that, therefore, her pots and jars should have been admitted as undecorated pottery, the duty on which is low. Her appeal, it is needless to say, was not sustained, and American artists residing abroad may heed the hint thus given to them, and take care to paint only on American material, if they do not wish to be suddenly summoned some day to pay the same duty as that charged on foreign pictures. The law, again, now allows "the free importation of cabinets of coins, medals, and all other collections of antiquities specially imported and not for sale." The last clause was added in 1874, and has, no one needs to be told, a prohibitory effect in many instances. Museums and galleries are proverbially poor, and it is impossible for them to watch European opportunities to enrich their treasures. Such duties as have recently been imposed on classical antiquities will, of course, prevent their importation with any chance of their disposal to any of the museums or private galleries. But it is evidently in vain to rely for relief on "a liberal spirit of interpreting the law," as the appellant usually does. In the words which generally deny his appeal, "relief must be sought from Congress."—*The Nation.*

ART NEWS.

THE jury of the International Exhibition, which was held last Summer at Munich, has made the awards, and the medals have been distributed. The results of the distribution are exceedingly unfavorable to English art and artists. News has been received that with the exception of Mr. Herkomer, himself a Bavarian by birth, not a single award was made to English artists. This seems to argue one of three things, that the English painters were not anxious to send their best pictures, or they did not have the best to send, or there was great partiality shown by the jury. The first and last suppositions are not most reasonable, hence English art seems to be on a par with Continental art, either French or German. The French artists seem to have been most successful, for out of eighteen first-class gold medals five were awarded to Frenchmen, namely, Bonnat, Bougnereau, Laurens, Dubois, and Mercié. It seems that the French obtained a full quarter of the first three classes of prizes, the balance going to Germany and other countries besides England. This result of the International at Munich has opened the eyes of some of the English, and led them to inquire into the causes of their lack of popularity with so intelligent a jury. May there not be a reason which, if fully stated, would not be highly complimentary to contemporary English artists?

—Through a correspondent of *L'Art* we learn that the celebrated fresco of Andrea del Sarto, of the *Madonna del Sacco*, painted above the entrance door of the old Church of the Annunziata, in Florence, is in danger of complete destruction, owing to the bad condition of the water-pipe outside the wall on which the picture is painted. It seems very strange that in the artistic city of Florence this favorite picture should be allowed to go to decay for the want of a few francs to make necessary repairs. The serious social, religious, and political problems which have been pressed upon Italy for solution during the past twenty-five years seem to have necessarily turned the public attention to a greater or less degree away from the preservation of her glorious art monuments, as well as from the generous encouragement of her native artists. It is much to be regretted that a work so important as this to the history of art should be permitted to take irreparable injury.

—We notice the recent death of our historical painter, Wm. H. Powell, in his fifty-seventh year. Mr. Powell was in many respects a great painter. The Rotunda at Washington contains his *Discovery of the Mississippi by De Soto*, which is justly regarded one of the finest examples of historic painting, with a purely American subject, in the United States. His *The Landing of the Pilgrims*, we believe, is now in the possession of Marshall O. Roberts, Esq. Some years ago he executed a commission for the State of Ohio, taking as his subject, *The Battle of Lake Erie*, in which Commodore Perry forms the central figure. A copy of this, executed for the general government, is now found in the gallery of the Senate. In his death America loses one of her most true and honest historical painters, some of whose works must be of permanent value in the art history of this country.

—Cyrus W. Field has finished a memorial shaft to Major John André, near Tappan, in Rockland County, New York. The shaft is of Maine granite, three and one-half feet square, and five feet high. There is no ornamentation, the polished surface being relieved only by inscriptions in modest lettering. The main inscription is beautiful of sentiment, and expressive of the feeling of the average American citizen towards this unfortunate officer: "Here died, October 2, 1780, Major John André, of the British Army, who, entering the American lines on a secret mission to Benedict Arnold for the surrender of West Point, was taken prisoner, tried, and condemned as a spy. His death, though according to the stern code of war, moved even his enemies to pity, and both armies mourned the fate of one so young and so brave. In 1821 his remains were received at Westminster Abbey. A hundred years after his execution this stone was placed above the spot where he lay by a citizen of the States against which he fought, not to perpetuate the record of strife, but in token of those better feelings which have since united two nations, one in race, in language, and in religion, with the earnest hope that this union will never be broken."

NATURE.

PHILOSOPHY OF RECREATION.—When any tissue or organ is in a state of activity in the performance of its functions, the activity which it manifests entails a process of disintegration, which is the reverse of the process of nutrition; that is to say, when a tissue or organ is doing its work, it is expending energy which it has previously derived by virtue of the process of nutrition. Work, therefore, so to speak, is the using up of nutrition; so that if the income of energy due to nutrition is equal to the expenditure of energy due to work, the tissue or organ will remain stationary as regards its capacity for further work, while, if the work done is in excess of the nutrition supplied, the tissue or organ will soon be unable to continue its work; it will become, as we say, exhausted, cease to work, and remain passive until it is again slowly and gradually refreshed or built up by the process of nutrition. Therefore, all the tissues and organs of the body require periods of rest to alternate with periods of activity; and what is true of each part of the body is likewise true of the body as a whole—sleep being nothing other than a time of general rest during which the process of nutrition is allowed to gain upon that of exhaustion. Thus we may have local exhaustion—as when the muscles of our arm are no longer able to hold out a heavy weight—or we may have general exhaustion, as in sleep, and we may have local restorations due to nutrition—as when our exhausted arm, after some interval of rest, is again able to sustain the weight—or we may have a general restoration due to nutrition, as in the effects of sleep. In the case of some organs—such as most of the secreting organs—activity is almost constant—owing to the constant expenditure of energy being just about balanced by the constant income; in the case of nerves and muscles this is not so; during the times when these organs are in activity their expenditure of energy is so vastly greater than their income during the same times, that they can only do their work by drawing upon the stores of energy which have been laid up by them during the comparatively long periods of their previous rest. Now recreation applies only to nerve and muscle, and what it amounts to is simply this—a change of organic activity, having for its object the affording of time for the nutrition of exhausted portions of the body. A part of the body having become exhausted by work done, and yet the whole of the body not being exhausted so far as to require sleep, recreation is the affording of local sleep to the exhausted part by transferring the scene of activity from it to some other part. Be it observed that a certain amount of activity is necessary for the life and health of all the organs of the body; so it would not do for the community of organs as a whole that, when any one set became exhausted by their own activity, all the others should share in their time of rest as in general sleep. But, by transferring the state of activity from organs already exhausted by work to organs which are ready nourished to perform work, recreation may be termed, as has been said, local sleep.

PERIODIC WAKEFULNESS.—A recent traveler in the Cevennes makes a very curious observation to the effect that there is in that region one stirring hour unknown to those who dwell in houses, when a wakeful influence goes abroad, and all the out-door world are aroused. The cocks crow, cattle awake in the meadows, sheep break their fast on the hillsides, and change to a new lair among the ferns; and houseless men open their eyes and behold the beauty of the night. This curious phenomenon the shepherds and old country folks declare takes place always about two in the morning. Apropos of this a correspondent to an English paper, says: "It is a mistake to suppose that this 'stirring hour,' when a 'wakeful influence' goes abroad is unknown to those who dwell in houses. I have been aware of it for a long time, and have noticed it year after year on myself though I live in a house. In the Winter I usually go to bed at nine P. M., but between one and two in the morning I wake, feel uncomfortably warm, and throw off some of the covering. Soon this discomfort passes away, I again pull up the blankets, and sleep till daylight. This occurs morning after morning as regularly as possi-

ble. In the Summer I wake at the same time, and with equal regularity, feel uneasy, toss about for some time, although at this season no blankets are used, but finally drop off to sleep. Again, I am rather subject to an occasional neuralgic pain on the left side of my head. When this occurs at night, it goes increasing to its *maximum* between one and two o'clock in the morning, after which it begins to subside. I have often suspected that some change in the *terrestrial magnetism* some time after the passage of the sun across the meridian, on the other side of the earth, may be the cause of this subtle influence. Whatever may be this influence which acts on the nervous system of men and animals between one and two o'clock A. M., there is a similar influence during the day, between one and two P. M., although it may not have been noticed. I have observed it because when I am suffering from my neuralgia in the day, it goes on increasing till one and two o'clock in the afternoon, when it abates. This question, then, naturally arises: are the periodical exacerbations in fever, neuralgia, and the like, due to some cosmical influence? Statistics on the subject would be worth collecting. It is probable that the nervous system of animals—a most sensitive tissue—would be readily influenced by any magnetic change in the earth, or by other subtle cosmical influences."

How do Fish Live in Winter?—In a late number of a scientific magazine we find the following inquiry: "Can any of your scientific readers give a satisfactory explanation of how it is that fish can exist below the ice for lengthened periods, and how, under such circumstances, their respiration is maintained?" Many of our lakes and rivers are completely covered with ice, in some instances of more than two feet in thickness, for a period of not less than three months. The fish do not appear, however, to diminish in numbers, and those captured shortly after the ice breaks up are in excellent condition. We know that fish are dependent for their respiration on the oxygen which water holds loosely in solution. By a movement of deglutition the water taken in by the mouth is passed from the pharynx into the gills, and, while escaping posteriorly through the membranous laminæ of the latter, gives off its loose oxygen, which purifies the venous blood contained in the delicate vessels by which the laminæ are traversed. It is a generally accepted fact that this admixture of oxygen with water is principally brought about by the perpetual agitation of the latter by storms, currents, etc. In the tanks of our public aquaria it is necessary to have a continual circulation of fresh water, or a rush of air into each tank, to prevent the fish from being suffocated. In streams, in small lakes, partly frozen over, in lakes entirely covered with ice, but supplied with large and inexhaustible feeders, it is not difficult to understand how the supply of air, which contains the requisite oxygen, is kept up. Many ponds and lakes, however, have no streams falling into them. Completely sealed by ice for months, their waters have no agitation in contact with the air. Their supply of water is drawn from subterranean springs, and that this is very scanty, owing to the absence of rain and low temperature, is proved by the fact that no water escapes from these lakes by their outlets. Many of these waters teem with fish, which must surely, sooner or later, absorb all the loose oxygen with which the water was charged previous to its being locked by ice. The demand for oxygen is unceasing, and if the usually accepted theory of aquatic existence is correct, what is the source of this supply of oxygen which our long Winters would almost lead us to believe inexhaustible? In this inquiry it is remembered that there is a wonderfully exquisite balance maintained between aquatic animal and vegetable life, as well as between land animal and plant life, by which the latter decomposes carbonic acid given off by animals, and produces oxygen, which in its turn is used by the animal. This process, however, can only take place under the influence of light, so that in the circumstances we are considering it must be to a large extent diminished, for in addition to two feet of ice covering the water, there are generally several inches of snow, which must rob plant life below of nearly, if not of all, sunlight. Here is certainly an occasion for speculation, or, what is far more valuable, the discovery of new facts.

Walking in a Circle.—It is said that one side of the body tends to *outwalk* the other side; that is, a person unguided by a path

always turns to one side or the other, at last describing a circle, returning to a point not far from that from which he started. Many such cases are on record, but it has not been certainly established to which side the turn is generally made. One student of the subject asserts that he has frequently been lost in the woods, finding that he invariably turned from *right* to *left;* that is if he started to go due north, he deflected toward the west; he also states cases of convicts wandering in a circle. A gentleman, long connected with a prison in New York State, writes on an instance of this kind as follows: "Two convicts escaped from the prison about the middle of the day; they started north upon a run intending to go to Canada; they said they ran almost continually, until almost dark when they found themselves near the prison yard, about fifty rods further south than their starting point, while they thought they were going exactly north all the time." It is also stated that it is a commonly received opinion among hunters and woodsmen that lost persons travel in a circle, turning to the left. This is very interesting, but not quite conclusive. Professor Burt G. Wilder, from whose lecture the above facts were gathered, says: "The experiment might be tried of letting a man, unprejudiced, walk blindfold over a plain covered with a light snow. I have tried walking in a room forty feet long, endeavoring to walk on the seam of the carpet with my eyes shut; in nine cases out of ten I found my deflection to be to the *right*, and, although I by no means regard such a trial as satisfactory, the result certainly accords with some facts already ascertained; for the greater propelling power of the right foot would cause the entire body to turn more toward the right."

SCIENCE AND COMMERCE.—As an illustration of the combination of science and commerce may be mentioned a new idea that has lately been carried out by a Swiss firm of chocolate makers. It is not stated whether the chocolate *bon-bons* have any peculiar merit in themselves, but the attraction lies in the manner of packing, the sweetmeats being put up in boxes containing two layers of small packets put up in very ornamental wrappers with colored designs, representing in series the various branches of natural history, such as birds, butterflies, fishes, fruits, flowers, and even palæontology and geography. Each box, containing about twenty small packets of chocolate, is accompanied with a concise descriptive treatise in French, written by a competent naturalist. That on birds is thus described: After a pleasant general introduction on the utility and charming attraction of birds, and the necessity of protection and preservation of many, a brief sketch is given of their properties of flight, structure, organs of sense, respiration, nests, eggs, and incubation, moulting, geographical distribution, migration, utility to man, and general classification. Instructions are also given for preparing and mounting bird-skins, and scientific descriptions are furnished of those birds chosen for illustration, either for their beauty or brilliant plumage. A similar plan to the above is adopted in other branches of natural history.

PHOSPHORESCENCE.—Phosphorescence appears in the flesh of marine animals along with a gelatinous substance which is formed. With the microscope MM. Bancel and Husson find two kinds of germs—at the surface, cells which no doubt produce this mucous fermentation; and in the mucus, very small bacteria. The cells are thought to act like plants, decomposing carbonic acid of the air by day, fixing the carbon and liberating the oxygen in the liquid. By night they liberate carbonic acid, and the germ then lives and causes destruction to the matters around it, condensing oxygen and producing carbonized and phosphorized hydrogen. The hydrogenized products being burnt as they are produced, cause the phosphorescence. The writers also consider the phosphorescence of the lobster due to a fermentation of the kind referred to.

Apropos of phosphorescence, M. Nuesch records in a recent number of the *Journal de Pharmacie*, some curious observations regarding luminous bacteria in fresh meat. Some pork cutlets he found illuminated his kitchen so that he could read the time on his watch. The butcher who sent the meat told him the phosphorescence was first observed in a cellar where he kept scraps for making sausages. By degrees all his meat became phosphorescent, and fresh meat from distant towns got into the same state. All parts of the animal, except the blood, acquired the phenomenon over the

entire surface. The meat must be *fresh;* when it ceases to be so the phosphorescence censes, and *bacterium termo* appear. None of the customers had been incommoded. It was remarked that if a small trace of phosphorescent matter be put at any point on the flesh of cats, rabbits, etc., the luminousness gradually spread, and in three or four days covered the whole piece; disappearing generally on the seventh day. Cooked meat did not present the phenomenon. No other butcher-shop in the place was affected.

ORIGIN OF CERTAIN MOUND-FORMATIONS IN CALIFORNIA.—The curious hummocky appearance of the surface of the ground so noticeable in the Yosemite Valley, as well as in many other parts of California, are thus explained by Dr. Barnes: These mounds, in their most common type, may be described as rounded eminences or knolls, rising from one to four feet from the surrounding surface, and ranging from ten to fifty feet in diameter. Each mound, he says, marks a spot where formerly grew a shrub, or cluster of shrubbery. Dust set in motion and borne along by the winds is arrested by the shrub, and together with the falling leaves accumulates within and around it, after nearly enveloping the whole plant. The gopher, subsisting upon the roots and preferring for its operations the loose soil about them, is, it may be, an adjunct of the wind in heaping up material about the plant. While this loose earth of which the mound is composed is protected by the foliage of the plant, more solid earth beneath it is also protected from the wash of rain by its massive roots, while all around erosion goes slowly on, facilitated by the peculiar susceptibility of the soil to wash. In the course of time the plant dies—is smothered by the drift which nearly covers it, or is destroyed by the annual fires. Thus deprived of its protection, the winds and rain wear down the top of the loose deposit, and, to some extent, widen the base. While this is going on the surrounding earth is being continually lowered by the action of water. The wash being greater at the base than at the summit, its effect is perpetually to maintain or increase the prominences.

RELIGIOUS.

THE SPIRIT OF UNITY STRENGTHENING IN PROTESTANTISM.—Irenical theology is really getting to be the *ology* of the modern Church. To be sure, attempts to secure peace in the Church have been common ever since differences first sprang up among those genuine souls who believe in ἀληθεύειν ἐν ἀγάπῃ, or the speaking of the truth in love (Eph. iv, 15); but never has there been such a determined spirit, at least not in *Protestantism*, to draw closer the lines of union, and to make stronger the disregard for differences. Not only in America, but also in England movements are on foot indicating the ripening sense of the great sin which has hitherto been committed against "the bond of peace," συνδέσμος τῆς εἰρήνης (Eph. iv, 3), and the importance of a real and practical unity of evangelical Christendom. It certainly sounds a little novel to hear the report of the Diocesan Conference of Manchester, recently held, where, as the result of a discussion of the question, "What can be done to bring non-conformists and conformists into close fellowship?" a resolution, though somewhat vague, was passed, recognizing the sin and scandal of divisions in Protestant Christendom, acknowledging that they have been encouraged by short-comings on the part of the English Church, and declaring the conference ready to "hail with the utmost satisfaction any proposals tending toward home reunion without compromising Scriptural truth and apostolic order." The mere consideration of the subject, still more the passage of such a resolution, is a promising feature of the Protestantism of to-day.

HOW DID THE APOSTLE PAUL LOOK.—A curious discussion between M. Rénan and M. Mézières concerning the personal appearance of St. Paul has followed the public reception of M. Rénan into the French Academy. M. Rénan has described St. Paul as a bald man, of short stature, aquiline nose, meeting eye-

brows, pale face, small head, piercing eyes, thick beard, prominent shoulders, and bow legs. Challenged to explain whence he derives all these remarkable details of St. Paul's personal appearance, he has cited the "Acts of Thekla" as his authority for the aquiline nose, the baldness, the meeting eyebrows, the small stature, and the bow legs, and the ecclesiastical history of Nicephorois for the small head, the piercing eyes, the pale face, the thick beard, and the prominent shoulders. As M. Rénan would certainly not accept either of these very unhistorical authorities as his warrant for any statements intrinsically improbable, it follows that, like an apocryphal writer, he has taken the portrait which answers his fancy. And M. Mézières very reasonably asks: "Would any one in his senses go to Defoe's 'Apparition of Mrs. Veale' with the view of discovering not what Mrs. Veale's ghost was like—being rationalistic enough to reject the ghost as a fib of Defoe—but what Mrs. Veale herself was like, where she had lived, and what were her circumstances?" The ways of imaginative rationalists are certainly wonderful, and their affirmations often stranger than their denials.

Dr. Falk Superseded.—At last Rome is victorious in Prussia, and though the victory is no honor to the papacy, yet Falk is beaten, and that is enough for Rome. Leo XIII sleeps easier in the Vatican, and William I leans once again for support on *the* Church in Christendom. And yet we doubt whether Prussia is as safe as it was with Falk for it and all Rome opposed. The May Laws will now soon lose their force, and erelong Roman Catholic prelates will *manipulate* scholastic and civil affairs as they once did. We know nothing of Herr von Gersler, who succeeds to power, but we know that Prussia will one day appreciate Dr. Falk if it does not now.

Samaritan Worship Still Faithful.—In the town of Nablus, or Schechem, where Jacob bought the parcel of ground on which his well is still to be seen, there are now living about one hundred and forty descendants of the original Samaritans. The temple, which was built after the captivity on the top of a mountain near Nablus, has disappeared, but the old observances laid down in the Pentateuch are still kept up. A correspondent of the *Methodist*, who was there at the last feast of the Passover, says he saw the ceremonies carried out just as they were arranged by Moses. A few moments before sunset the congregation assembled with the chief priest and the elders for the sacrifice. They repeated portions of Scripture, and then seven rams were led out and examined by the high-priest to see that they were without blemishes, and exactly as the sun sank behind the sea their throats were cut. The blood of one was collected in a basin, and one of the elders with a bunch of hyssop marked the doors of the tents.

Methodism Abroad.—The sessions of the four important foreign Methodist conferences have been held, and the statistical returns show a general increase every-where. The Sixtieth Primitive Methodist Conference convened at Leeds, and reported 182,877 members. The French Wesleyans met at Lausanne, where lay delegates attended for the first time. The Methodist New Connection held its eighty-third Conference at Huddersfield, England, and with a membership of 26,688 there came a report of an increase of 17 chapels, 10 circuit preachers, 10 societies, and 1,876 Sunday-school scholars. The Irish Wesleyans met at Belfast in the one hundred and tenth conference, and it was the largest ever held in Ireland.

Evangelistic Labors in France.—Truth is stranger than fiction is a saying once more verified in the marvelous work wrought by Robert M'Call among the French in their own country, and especially in their capital. Recently, at one of those monthly united meetings which the English-speaking congregations of Paris are now accustomed to hold at the suggestion of M'Call, this good man gave an account of the progress of his work. During the year, 50 French pastors had paid 1,200 visits to his 23 Paris stations. These stations have increased to 30, and in all France there are about 70 of such places, nearly half of which were started in the year 1879.

Sunday-school Choirs in England.—This is one of the latest novelties in Sunday-school work, and not a bad idea either. It also promises to be a success, for very recently the seventh festival of the Sunday-school Choir was celebrated in London, and was partici-

pated in by one hundred and thirty choirs counting five thousand voices. The only purpose of these choral organizations, which are strictly undenominational, is improvement of Sunday-school children in devotional singing.

RELIGIOUS MISCELLANY.—What Roman authority can do in Belgium is apparent in the resignation of one-seventh of all Belgian school-teachers, 2,472 pedagogues preferring to want for bread temporal rather than lose that spiritual bread which the successor of St. Peter deals out through his representatives in Belgium. Strange things for our vaunted nineteenth century advancement!

—What a worker that London Spurgeon is! Unable to stand up in his pulpit, he insists upon preaching with one knee resting upon a chair. He surely is not a man who believes in rusting out. What will London do when Spurgeon shall no longer be able to enter the pulpit? How many thousands of souls will miss his stimulus and companionship when go he must.

—In the death of Bishop Emil Ado Schweinitz the Moravians have sustained a very great loss indeed. He was only sixty-three years old.

—The Episcopalians are astir. There has been a quickening of the dry bones, and religious fervor is decidedly on the gain. In the Diocese of Illinois Bishop M'Laren referred in his pastoral address to the laxity of morals and atheism which exist, and said one cause was to be found in the teachings of "smooth-tongued pulpit orators who have rung the changes on the word 'love' until they have given the idea that God can not discriminate between right and wrong." The Diocesan Convention of Kentucky condemned fairs and festivals and concerts to raise money for Church purposes, and gave special condemnation to "the practice, of which it has heard with pain, of such festivals, held with the unseemly addition of dancing, and often the sinful accompaniment of gambling."

—A company of "Old Believers," a dissenting sect of Russia, has been condemned to two months' imprisonment for building a church. This is liberty of conscience in the great empire of Eastern Europe!

—So we are to have an Old Catholic congregation in the States finally! *On dit* the Rev. T. A. Vandey is about to organize one in New Orleans, where a number of Catholics stand ready to forsake the Church of the Infallibles.

—The American Board of Foreign Missions is indignant against Austrian intolerance as exhibited in Prague. They say that "two neighbors can not read the Bible together," so severe are the rules against evangelical efforts. Even social conversation on religious topics is interfered with by the police. No wonder thinking minds plot against such a government.

—Apropos of M'Call's work in France is the effort of Dr. Somerville, the Scottish evangelist. At Nîmes and other places which he has visited he has stirred the people wonderfully. Regular missions are being established as an immediate result.

CURIOUS AND USEFUL.

WEDDING RINGS.—From very early ages a peculiar charm appears to have been connected with the ring. Without beginning or end, it has long been regarded as an emblem of eternity, and also of the strength and perpetuity of affection. The fourth finger of the left hand has long been considered sacred, and hence has been consecrated to wear the wedding ring. The Greeks and Romans were so fully convinced of the intrinsic value attached to this finger that it was called the medical or healing finger. Their various medical preparations were stirred with it in place of a spoon, it being supposed that should any noxious ingredients be included in the cup, warning of the fact would immediately be given by a palpitation of the heart. In some remote country places in England this superstition is still firmly believed in. The other fingers are thought to possess a certain power of evil, but a wound or sore stroked by the wedding finger is expected by them in a

short time to disappear; and the wedding ring itself is by many supposed to have the same effect. The rings used by the Jews at their marriage ceremonies were sometimes very large in size and elaborate in design. The Jewish law demanded, too, that they should be of a certain value, and to prove this to be the case, they were before the ceremony submitted to an examination. It was a rule also that the bridegroom should purchase the ring out of his own private resources, and not obtain it either on credit or as a gift from a friend. And after the ring had been placed on the bride's finger, the marriage was considered then, as it is now, to be irrevocably binding. Among the fishermen on the west coast of Ireland the wedding ring is kept as an heir-loom in the family, and is considered the property of the eldest married daughter. Consequently many of the wedding rings still worn by the fish-wives in that district are quite old and of exceedingly ancient design, being manufactured as far back as the Elizabethan era. In the sixteenth century both marriage and betrothal rings were made with a motto or posy inscribed inside, and to these Shakespeare in two or three of his plays refers.

THE STORY OF EVE'S CHILDREN.—Hans Sachs surpasses himself in the story of "Eve's Unlike Children," the best known and most delicious of all his productions. Adam and Eve, cast out of Paradise, sit wearied and depressed with their day's work. Adam, trying to comfort his wife, mentions, in off-hand fashion, how an angel has just given him a piece of news. God will visit them to-morrow to hold high feast (*hohe Fest*), and see how they are keeping house and bringing up the children. Therefore, let Eve sweep the rooms, spread the floors with sweet straw, wash the children, and dress them in their best. The first part of the injunction is easily obeyed, but not so the second, for Eve's children are sharply separated into two groups. Some are very good, pretty, and obedient; the others are bad, dirty, unruly, and deformed. Abel and those like him are soon made tidy; but Cain and his fellows are playing and quarreling in the gutter, and finally refuse to let themselves be washed. When Abel announces who is coming, Cain replies, "I 'd liefer he would stay away." When his father bids him prepare for the prayer, sacrifice, and sermon on the morrow, the wicked child wishes that "prayer, sermon, and sacrifice had never been invented." At this Eve loses her patience, and exclaims she will leave them the eye-sores that they are, and God will find them a dirty rabble, foul as pigs. But in one version she relents, and stows them away in the loft under the straw, in the chimney. Next day the visitor comes as announced, and after a hospitable welcome asks to see the children. Those who are dressed, with Abel at their head, advance singing a psalm, and shake hands with the guest. He asks them questions out of Luther's Catechism on the Lord's Prayer, the Creed, the meaning of Amen, the Commandments, with what they forbid or require, and the children come off with flying colors. Reassured by their success, Eve ventures to produce the other lot; but when they come tumbling in dirty, naked, shapeless, unkempt, God can not keep from laughing. (*Der Her tet des rostigen haufens lachen.*) They offer him their left hands, make a frightful mess of the Catechism, and excuse themselves on the plea that they don't see the use of it, that they can't remember it, that they did not know he was coming. The examiner is much displeased, and determines to punish them. They and their seed shall be mechanics, fishermen, and peasants, but Abel and the good children shall be kings, nobles, rich merchants, and professors (*Gelehrten*). Eve, in pity for her offspring, offers objections, but is told that all is for the best—only in this way can there be order in the world. Even here, then, Hans writes with an object, and with the very Lutheran one of justifying the existence of ranks. In this sense Melanchthon tells the story in another version. And to any who have found it irreverent we may say with Hans himself that he has it from the Latin of Melanchthon. But such an excuse is unnecessary. Even the figure of the Deity is not irreverent, but only quaint and at heart truly Protestant. Tieck characterizes him as a "strict but affable superintendent."

MORTALITY IN A GENERATION.—A writer in an English magazine studies from birth to death the march of an English generation through life, basing his observations on the

registrar's annual reports. The author singles out for illustration a generation of one million souls, and finds that of these more than one-fourth die before they reach five years of age. During the next five years the deaths number less than one-seventh of those in the first five. From ten to fifteen or twenty the number of deaths increases again, especially among women. At this period, too, the influence of dangerous occupations begins to be seen in the death rate. Consumption is prevalent and fatal from twenty to forty-five, and is responsible for nearly half the deaths. From thirty-five to forty-five many persons succumb to disease of the important internal organs. By fifty-five the million is but 421,115; at seventy-five, 181,124; at eighty-five, 38,565; and only 202 reach the age of one hundred. And the moral of it all is, "We can't live always."

TELEGRAPHY FOR EVERY BODY.—In a recent number of *La Nature*, G. S. Carpi says he has devised an apparatus by means of which any one can transmit or decipher telegrams, using the Morse system, without previous study. It is designed for use only in exceptional cases, and, indeed, can not supersede the necessity of skilled operators. The apparatus consists of a square piece of card-board, having a number of openings parallel to each other and to the sides of the card-board, so that, passing underneath a thin sheet of metal, the surface shows so many metallic rectangles, separated from each other by equal intervals, one for every sign required in telegraphy. Thus the letter A would be represented by a short metallic rectangle, followed by a longer one, the letter itself being clearly written to the left of the sign. Of the four compartments of the board two are occupied by the alphabet, one by the stops, and one by the ciphers. To send messages by means of this board a fork is used, composed of two conducting wires, insulated from each other, inclosed in a glass tube, to the ends of which they are fastened. At one end the tube terminates in two tongues of elastic metal, parallel to each other, at a distance of about two millimetres, and communicating respectively with the two wires within the tube. These latter are also attached to two other insulated and very flexible wires, which communicate with Nos. 1 and 3 of the key-board, so that the two tongues form the ends of an open circuit, which will be closed every time that an arc of conductivity is formed from the one to the other. If the fork is drawn with a certain degree of uniformity over the various series of metallic plates there will result such and so many completions and interruptions of the circuit as to form the dots and dashes of the Morse alphabet. To enable non-experts to read messages received he simply arranges the letters of the Morse alphabet on a card in groups according to the number of signs in their composition, and thus diminishes the labor of search.

THE DISCONSOLATE WIDOW.—The following unsophisticated production, selected from a "History of Advertising," written by M. Sampson, may prove amusing. From a Spanish paper is gathered the following:

"This morning our Savior summoned away the jeweler, Siebald Illmaga, from his shop to another and a better world. The undersigned, his widow, will weep upon his tomb, as will also his two daughters, Hilda and Emma, the former of whom is married, and the latter is open to an offer. The funeral will take place to-morrow.—His disconsolate widow, Veronique Illmaga. P. S.—This bereavement will not interrupt our employment, which will be carried on as usual, only our place of business will be removed from No. 3 Lessi de Teinturiers to No. 4 Rue de Missionaire, as our grasping landlord has raised our rent."

It is impossible to avoid admiring the adroitness with which the disconsolate widow continues mourning and money-making, and takes the opportunity of giving a rap at the heartless landlord.

HOW SCORPIONS DESTROY THEMSELVES.—Dr. Allen Thomson, of London, gives the following account of the scorpion committing suicide by means of its own poison: While residing, many years ago, during the Summer months, at the baths of Lucca, in Italy, in a somewhat damp locality, my informant, together with the rest of the family, was much annoyed by the frequent intrusion of small, black scorpions into the house and their being secreted among the bed-clothes, in shoes, and in other articles of dress. It thus became necessary to be constantly on the watch for

these troublesome creatures, and to take means for their removal and destruction. Having been informed by the natives of the place that the scorpion would destroy itself if exposed to a sudden light, my informant and her friends soon became adepts in catching the scorpions and disposing of them in the manner suggested. This consisted in confining the animal under an inverted drinking glass or tumbler, below which a card was inserted, when the capture was made, and then, waiting till dark, suddenly bringing the light of a candle near the glass in which the animal was confined. No sooner was this done than the scorpion invariably showed signs of great excitement, running round and round the interior of the tumbler with reckless velocity for a number of times. This state having lasted for a minute or more the animal suddenly became quiet, and turning its tail or hinder part of its body over its back, brought its recurved sting down upon the middle of the head, and piercing it forcibly in a few seconds became quite motionless, and in fact quite dead.

WHY SHAKESPEARE WAS FORTUNATE.—It is curious to reflect that if Shakespeare had lived out his legitimate allowance of three score years and ten he might have witnessed the production not only of the first but of nearly all of the best works of his school; had his life been prolonged for ten years more he would have witnessed its final extinction. Within these narrow limits of time the drama had undergone a change corresponding to the change in the national mood. The differences, for example, between Marlowe and Massinger at the opening and closing of the period—though their births were separated by only twenty years—corresponds to the difference between the temper of the generation which repelled the Armada and the temper of the generation which fretted under the rule of the first Stuarts. The misnomer of Elizabethan, as applied to the whole school, indicates an implicit perception that its greater achievements were due to the same impulse which took for its outward and visible symbol the name of the great queen. But it has led also to writers being too summarily classed together who really represent very different phases in a remarkable evolution. After making all allowances for personal idiosyncrasies we can still see how profoundly the work of Massinger is colored by the prominent sentiment of the later epoch.

LITERATURE.

IT is a matter of good omen that no insignificant share of modern scholarship is freely given to the elucidation of Scriptural subjects. As the result of this we have a variety of scholarly monographs, some of them in the form of studies of the lives and characters of persons, often the most eminent in the annals of the Church. Thus there have been produced, within the comparatively recent past, a great many lives of Christ,—some of them indeed of little worth, but others among the very best contributions to contemporary Christian literature. So, too, the history of St. Paul, his works and writings, his character and his place in the planting of the Church and the development of Christian doctrine, have lately received a marked share of attention, greatly to the enriching of this department of learning. The unprecedented wealth of learning embodied in the great work of Conybeare and Howson, and in the scarcely inferior production of Mr. Thomas Lewin, might have seemed to preclude any thing further on the subject; but now again we find this theme discussed at length, and with an unstinted expenditure of learned labors, by one already known and recognized as scarcely inferior to any other in New Testament learning. Canon Farrar's "Life of Christ" has been received by the Church, and indeed by all who are capable of a proper appreciation of such a work, as a real classic in modern Christian literature; and now we have from the same high source an elaborate discussion of *The Life and Work of St. Paul.** To this work, which must have

*THE LIFE AND WORKS OF ST. PAUL. By F. W. Farrar, D. D., Canon of Westminster. In two volumes. New York: E. P. Dutton & Co. Pp. 678 and 668.

been upon its author's hands during a long series of years, he evidently brought a mind richly stored with all requisite learning, both general and specific, and habits of discriminating and deciding in difficult cases, and especially a heart in earnest sympathy with his theme, by which he was fitted justly to appreciate the real excellences of his illustrious subject. As the result of all these things, so combined and brought to bear upon his theme, we have a monograph of very great value, treating its subject with wonderful ability, and presenting and discussing its various details and its aggregate unity with great force and fullness.

The place which Canon Farrar occupies among theological and Biblical writers was already pretty well determined by his "Life of Christ," and also by certain minor productions, some of which for a variety of reasons have made no little stir in the world. As a theologian he is evidently "broad," but without being loose; and though his orthodoxy may be called in question in respect to certain speculative points, yet he is confessed to be eminently sound on all those great and essential points which have been universally accepted in all evangelical Christendom. As a Biblical scholar and critic he is evidently very thoroughly learned, and therefore both liberal and yet conservative of the great truths of revealed religion. Holding firmly to the supernatural in religion and to the doctrine of the inspiration of the Bible, he is not blind to the natural side of religion as taught and experienced among men, nor to the human element in the Holy Scriptures, thus leaving room for, and demanding the use of, reason and scholarship in their interpretation. These views seem to have guided him in the prosecution of his work, and to have determined its character.

This discussion of "The Life and Works of St. Paul" is at once a life-story, a history of the early Church, and a commentary on the Pauline epistles, from which category, as might be anticipated, is excluded the Epistle to the Hebrews. He is by no means an undiscriminating admirer of his great subject, and especially in respect to his merely literary eminence he places the great apostle somewhat lower than some others have done. And yet he assigns him a high place among the great men of the world, and especially concedes his super-eminence in developing and setting in order the great doctrines of the Gospel, in opposition to Jewish ritualism and literalism on the one hand, and to the vain rationalizing of the effete philosophies of the Greeks on the other. To him more than to any other was given the high honor of bringing the Church out of the bondage of Pharisaism, and of guarding it against the vain philosophies of the age, and so leading it into the liberty and the spirituality which belong only to itself. The intelligent Christian reader, while probably he will decidedly dissent from some things in these volumes, will not fail to find very much in them to elevate his estimate of their wonderful subject, and to both inform his understanding and warm his heart.

ALL history is largely biographical, and all Church history, because of the predominance of the subjective elements in the Christian religion, must be especially so; and though a series of biographies must form only a fragmentary history of the universal Church, yet this defect is very largely compensated for by the clearer and more definite settings given to the things related by their incorporation into individual and personal life-stories; and this consideration shows the value of collected volumes of Christian biographies. A very good specimen of this class is just now given to American readers by Rev. Dr. H. M. Maccracken, of Toledo, Ohio, and through the publishing house of Phillips & Hunt, Methodist Book Agents at New York, comprising a hundred and twenty-five sketches of *Leaders of the Church Universal*,* beginning with Symeon of Jerusalem, in the earliest post-apostolical times, with a succession made up of Ignatius, Justin Martyr, Polycarp, and Origen, and still later "fathers," coming down by the usual highway of Church history to Augustine—over a hundred in all. The second period, reaching from about A. D. 400 to 1000, is devoted to European and cisalpine subjects, and among its eighty names are those of St. Pat-

* LIVES OF THE LEADERS OF OUR CHURCH UNIVERSAL, from the days of the successors of the apostles to the present time. The lives by European writers from the German, as edited by Dr. Ferdinand Piper, now translated into English and edited with added lives by American writers. By Henry Mitchell Maccracken, D. D. New York: Phillips & Hunt. 8vo. Pp. 874.

rick and Columba, Austin of England, Alcuin of France, Boniface of Germany, and Cyril of Slavonia. Among the "Great Mediæval Doctors" are named Anselm and Bernard, Thomas Aquinas and St. Louis; and their contemporaries, Waldo of France, Wiclif, Huss, and Savonarola. Of the "Reformation" period are Luther and Melanchthon, Hans Sachs and Ursinus, Zwingle and Œcolampadius, Olaf Peterson, Farel, Calvin, Beza, and Coligny on the Continent, with Cranmer and Ridley in England, and Hamilton, Wishart, and John Knox in Scotland. Among the European names for the last three centuries are those of Gustavus Adolphus, Paul Gerhardt, Spiner, Francke, Bengel, and Zinzendorf; Ribaut, Roussel, and Oberlin; Guthrie and MacKail, Baxter, Wesley, Wilberforce, and Elizabeth Fry. Thus far the book is chiefly a translation from the German of Dr. Ferdinand Piper, while the following more than three hundred pages are filled with original matter devoted to American subjects, extending from Brewster of the colonial times to Dr. Hodge and Adoniram Judson.

The theological and ecclesiastical stand-point of the work is that of evangelical Protestantism, and both the selection of subjects and the manner of treating them, and the presentation of the various questions with which they were identified are influenced by that fact, though within this qualification, the largest catholicity is every-where displayed. The selection of modern subjects, and especially those for this country, was manifestly a difficult and delicate task; and its performance is perhaps as satisfactory as the case would allow. In all such cases of inclusive selection there must of necessity be much larger omissions of those who might seem to have equal or greater claims to recognition. The Methodist names found in this part are those of Bishops Asbury and M'Kendree, and Dr. Wilbur Fisk—all good selections, though the lives of the two bishops cover nearly the same field. When personally consulted on the subject we gave the names of Dr. Nathan Bangs and Peter Cartwright as representatives severally of Eastern and Western Methodism during the first half of the present century; but the limits of the work forbade the use of these and many others quite worthy of a place.

As a whole the book is valuable as to its matter, and very readable. It is a decidedly good book for non-professional readers, and specially suited for a place in the Christian family library.

"THE conflicts of science and religion" is a phrase in which learned conceit has often embodied its self-complacent superficialness, and the "harmony of science and religion" is the style of the superserviceable offices of certain well-disposed persons who seem to think that the whole system of Christianity exists by the favor of rational science. It is better, however, to turn away from both of these, and to accept the truth that science clearly demonstrates, and in its light examine the data of revelation. This is the course taken in the recently published work which we have read with much satisfaction.* The animus of the book is pretty accurately set forth in a single sentence of the author's preface, "I would read the old faiths, *which I still believe*, in the light of modern thought, *to which I can not be blind.*" It is no doubt true that many of the fancies of the traditional beliefs—mere excrescence upon the system of biblical truths—must be cast off in the growth of biblical learning, and of a more spiritual faith, but the truth itself will remain intact. The author attempts a kind of philosophical explanation and proof of this species of intellectual and spiritual "development," which, while it is suggestive and often helpful, is by his method somewhat injured by too closely copying the German forms of discussion, which is certainly not so well adapted to English and American readers as the more natural methods of their own countrymen. The title of the book is happily chosen; the truths of religion are as old as the race of man, but each epoch of human progress presents them in new lights. It is vastly important to hold fast the substance, but it is more than permissible to hold very loosely to all besides.

WHEN a writer for the periodical press has succeeded in putting his or her best thoughts into a variety of articles, which publishers have accepted with evident pleasure and used without much delay; and when such a writer has been complimented by friends, and the said

*OLD TRUTHS IN NEW LIGHTS. By Newman Smyth, author of "The Religious Feeling." New York: Charles Scribner's Sons. 12mo. Pp. 391. $1.50.

articles have been spoken of as of a high order of merit and quite too valuable to be allowed to perish with the ephemeral sheets in which they appeared, then the temptation to "make a book" becomes especially strong, and oftentimes quite effectual in producing the course of action indicated. Now all these things have happened to Elizabeth Stuart Phelps, and the tangible outcome is in hand—a plump little book,* crammed full of things new and old, especially the old, of hashed meats and old clothes "amaist as good's the new." In her very brief and eminently characteristic prefatory "note" the author tells the reader what many of them might have known without the telling, that "many of these stories are reprinted from *Harper's Monthly*, the *New York Independent*, *Scribner's Monthly*, and the *Atlantic Monthly*." But as literary productions they are altogether worthy of the more permanent setting here given them. Miss Phelps is an able and spirited writer, and though not entirely destitute of the acridity of temper that characterizes most of our "strong-minded women," yet hers is relatively a mild type of that kind of *rabies*. Æsthetically she is thoroughly individualized and pronounced in her utterances. Socially she has decided convictions, which, if made practical, would work some changes in the social and political estates, but whether for better or worse may be an open question. Theologically she is a negative quantity. Her confession, should she attempt to make one, would be just the opposite of a *credo*, for certainly she *doubts* very many things that others believe, but whether she *believes* any thing herself is uncertain. Such writers mingling their works with the *quasi*-religious literature of the times are pretty sure to find readers, just as preachers of heresy in orthodox pulpits are sure to have hearers, while sailing under their own flag they are usually left to themselves; and those and these are alike to be appreciated according to what they are. The title is simply that of the first piece, and not at all descriptive of the rest of the book.

VERY great improvements have been made in the appliances and helps for the study of the classics during the life-time of the older half of the now living generation, who learned to read their Latin with the help of Adam's Grammar and Ainsworth's or Schrevellius's Dictionary; and it is especially noteworthy that these improvements are largely the work of American scholars. Some thirty years ago Dr. Freund's great Latin-German Lexicon was brought out by Harper & Brothers in an English translation, thoroughly edited, and, indeed, to some extent reproduced, by Dr. E. A. Andrews, which has been very extensively used, both in this country and in England, and it has thus served as a standard authority for a whole generation of scholars. Fifteen years ago a revisal of the original work was undertaken by its author (Dr. Freund), but it was prosecuted by him to only a limited extent, when the work fell into the hands of Professor Henry Drisler, of Columbia College, New York—at first the pupil, then the assistant, and finally the successor, of Professor Anthon—by whom the whole work was thoroughly reconstructed and largely rewritten. But as there yet remained many details to be examined and adjusted, for which Dr. Drisler could not command the necessary leisure, the completion of the work and its conduct through the press was committed to the editors named on the title-page of the present edition, Professor Charlton T. Lewis and Dr. Charles Short, of Columbia College. The completed work,* as now given to the public, is a prodigy of learning, and an unrivaled specimen of scholarly accuracy and completeness. Mr. Lewis probably has few equals as a thorough Latinist, with equal learning and facility of writing in his own vernacular—the last no unimportant consideration in the preparation of educational works. In respect to a matter which, though often but little thought of, is really of great practical consideration, the avoidance of errors of the press, assurance is made to the public by the announcement that "through the patient skill of the proof-reader, Mr. George W. Collord, exceptional accuracy in this respect has, we believe, been attained." We congratulate

* SEALED ORDERS. By Elizabeth Stuart Phelps, author of "Gates Ajar," etc. Boston: Houghton, Osgood & Co. 12mo. Pp. 345.

* HARPER'S LATIN DICTIONARY. A new Latin dictionary. Founded on the translation of Freund's Latin-German Lexicon, edited by E. A. Andrews, LL. D. Revised, enlarged, and in great part re-written. By Charlton T. Lewis and Charles Short, LL. D. New York: Harper & Brothers. Imperial octavo. Pp. 2,019.

all who shall hereafter be called either to study or to teach the language of imperial Rome that their way is so well prepared before them.

It is sometimes objected, and not without good reasons, that books of practical instruction fail of their purpose because they assume too much for those to whom they are addressed. Our learned treatises on "Homiletics" and elaborate "Lectures on Preaching"—*et omne id genus*—may all be very well in the places for which they are designed, but for some of those who are called to "labor in word and doctrine" they are not all that is needed. Believing all this, our old friend, Dr. James Porter, who is grandly attesting the promise about "bringing forth fruit in old age," has prepared a book* about preaching for "self-educated ministers," which phrase is, perhaps, a euphemism for *uneducated* preachers. It is really a treatise, discussing both the theory and practice of preaching, with special adaptation to the Methodist ministry, both traveling and local, including "exhorters," and giving hints and suggestions respecting the manner of "behaving one's self in the house of God," to which hints not a few might profitably give earnest heed. There are also some good suggestions about prayer-meetings, which some eminent ministers confess they do not know how to manage, and they demonstrate the truth of their confession by their works. But the Methodist minister who fails at this important point is himself a failure. A sensible man once remarked that he liked for his own reading books for the young and the children's department in the newspapers, for they taught him something; and it may be suspected that not a few such will prefer Dr. Porter's book to more pretentious ones for the same reasons. We give below its fearfully long title, which is the most formidable page of the whole book.

Merle D'Aubigné's history of the times of Calvin is now complete,—the seventh and last volume has recently been given to the American public, by the Carters. At the time of the decease of its author only five volumes had been published, but it was then understood that the work was substantially finished, and that another volume, soon to be issued, would complete it.* But the editor found, on examination, that it would be impossible to compress the whole matter into a single volume, and the event has proved that two full-sized ones were necessary. The public has reason to render thanks to the editor and publisher of this great work, whose intrinsic value is not diminished by the fact that it is written by one who had more than a historian's interest in the things that he detailed. Dr. Merle D'Aubigné was an earnest admirer of the character and work of his great subject, and so long and earnestly had he dwelt upon the subject of the men and events of the Reformation, that he said of himself that he lived in the sixteenth century rather than the nineteenth, and thought and felt like a man of that time. All this gave him a peculiar fitness for his work, though it also leaves something for each reader to do, in bringing those times into living contact with our own. The work, as a whole, is a valuable contribution to ecclesiastical history.

Medical electricity is not a new subject, neither in the profession nor in literature;—nor yet is it a subject so thoroughly understood that nothing more is to be said about it. In truth, probably, it may be said of this as of most other departments of the healing art, that it has scarcely gotten beyond the empirical stage,—in which the practitioner must treat symptoms, and await results. Dr. A. D. Rockwell (46 East Thirty-first Street, New York), has been for some years practicing in this specialty, using all available lights from the experience and deductions of the past, and carefully feeling his way forward; and judging from the records of his practice, given in a *brochure* filled with condensed reports of cases (99 pages), it would seem that his efforts have, in a good many cases, been attended with eminent success. As we belong to the laity in this

* Hints to Self-Educated Ministers, including local preachers and exhorters, and other Christians whose duty it may be to speak more or less in public. By James Porter, D. D., author of "Compendium of Methodism," etc., etc. With an introduction by Bishop William L. Harris, D. D., LL. D., of the Methodist Episcopal Church. New York: Phillips & Hunt. Cincinnati: Hitchcock & Walden. 12mo. Pp. 300.

* History of the Reformation in Europe, in the time of Calvin. By the Rev. Merle D'Aubigné, D. D. Translated by William L. R. Cates. Vol. VII, Geneva, Denmark, Sweden, Norway, Hungary, Poland, Bohemia, The Netherlands. New York: Robert Carter & Brothers. 12mo. Pp. 576.

department, we would speak modestly, but may say that, to our seeming, there is something quite worthy to be considered in respect to the medical use of electricity, including galvanism, and Faradayism, in the treatment of a variety of forms of disease, especially those of the nervous system.

Rev. B. Weed Gorham, of the North-west Iowa Conference, has issued, through the Western Methodist Book Concern (Cincinnati, Hitchcock & Walden), a 16mo volume of 281 pages, with the title, *God's Method with Man*, and for a second title he calls his book, "Sacred Scenes along the Path of Heaven." It is a condensed system of Theo-anthropology,—so much of the general science of theology as has man for its special subject. It is a good book, only that it is unnecessarily polemical and controversial, which causes it to appear opinionated and one-sided. Five of its twenty-three chapters are directly devoted to "Entire Sanctification," and nearly all of them have a leaning in that direction. It contains much that is good, and no doubt it will be appreciated by not a few.

Dr. Alexander Fletcher's Guide to Family Devotion* has proved an inestimable blessing in numberless Christian households. Like à Kempis, and "the Christian Pattern," and the "Saint's Rest," it has been printed in numerous editions, of all sizes, from the little hand-book to large and sumptuously bound octavos. Just now, the Carters are bringing out a new and very fine edition, a large quarto, fine paper, beautifully printed, and illustrated with fine steel engravings, and, at least some of the copies, are put up in fine binding and gilt, making altogether a sumptuous volume.

Quite independent of all questions about the relative excellence of written or extempore prayers, such a volume has its value as a manual for private devotional reading. The Scripture lessons and the brief expositions are usually to the point; are well chosen,—the hymns (mostly Watts's), are admirably adapted to awaken devotional feelings, and the prayers are full of devout confessions, and earnest supplications—perhaps rather deficient in respect to assurance. Whoever will make this noble volume their daily companion, devoutly going over the whole matter in order, will not fail to profit by the exercise. The book would make a very good Christmas present to a Christian friend.

The practice of telling in familiar words and styles the stories of the Bible—for the benefit of young people—perhaps some no longer children might be both pleased and profited by reading them—is not new, nor yet is it likely to grow old. A volume* made up of twenty such, extending from that of Cain and Abel, down through the Old and New Testament times, is now before us, prepared for his own young people by an English minister. The book is a decidedly good one, and will do good.

Italy is a most interesting country, quite as much so in its history as in its soil and climate, and its cities and monuments,—and beyond all else in its religious history, in which the name of Savonarola is the chief central figure. A book covering the period in which he lived, and telling of his doings, written in an animated and picturesque style, can not fail to be acceptable. Such a one we find, in the volume whose title is annexed.†

Religious stories have become a prevalent form of literature, and of course the press teems with books of that kind. Whether this is for the better or the worse may be an open question, but not so as to the fact itself, which is already fully determined. In favor of this proceeding it may be said that people will read fiction, and therefore it is best to supply them with books of unexceptionable moral and religious character; to which somebody else may reply that a good many people will read such books as come to them with a guarantee of their harmlessness, and within this limitation the lightest and least instructive will often be preferred. And so the religious novel may

*A Guide to Family Devotion, containing a Hymn, a portion of Scripture with Reflections, and a Prayer, for the morning and evening of every day in the year. With an Appendix of Prayers and Hymns on various subjects. By the Rev. Alexander Fletcher, D. D. New York: Robert Carter & Brothers. Quarto. Pp 776.

*Bible Children; Studies for the Young. By the Rev. James Wells, M. A. New York: Robert Carter & Brothers. 12mo. Pp. 262.

†Times Before the Reformation, with an account of Savonarola, the Friar of Florence. By William Dinwiddee, LL. B. New York: Robert Carter & Brothers. 12mo. Pp. 381.

promote light reading where otherwise a better kind of books would be used. Among the most prolific of our publishers of this class of works is the old and intensely conservative house of Robert Carter & Brothers, whose imprint has been accepted as a pledge of the safe character of any book that may bear it. Among their late issues we notice *Lady Sybil's Choice*, a story of the Crusades, by Emily Sarah Holt; and *Was I Right?* by Mrs. O. F. Walton—both good of their kind. Better than these are the two little square volumes, *Mamma's Bible Stories*, and *Sequel to Bible Stories*, by the author of "Fanny and her Mamma." The adaptation of Biblical narratives, to the minds of children is well done, while externally the books are beautiful.

It is pleasant to read after a critical writer who is on good terms at once with his subjects and himself; even a little egotism and self-conceit are in such a case not altogether intolerable. Such an instance we have in Peter Bayne's book of strictures on Carlyle, Tennyson, and Ruskin, reproduced with corrections and enlargements from articles originally published in the *Literary World*.* The writer very gracefully sits down at the feet of his "masters," but does not hesitate, when called to it, to dissent from their opinions and judgments, and to give his reasons for so doing. His book is decidedly readable, gossipy, perhaps sometimes *fussy*, like its author, but still interesting, and to a degree instructive. For occasional and leisurely reading, and as a substitute for the over-abundant fictitious productions of the press, the book is quite worthy of commendation. It is put up in decidedly good style.

The progress of practical science, and the wide range of subjects over which it is spreading itself, are such as only special adepts can hope to keep up with. The *Telephone*, the latest scientific contribution to practical, every-day affairs, is now demanding the attention of all who would not willingly fall behind the progress of the times. For such, a valuable help is now offered in the comprehensive, yet not over-full presentation of this whole subject in the work just translated from the French of the Count du Moncel, and issued by the Harpers.† It is written in a clear and plain style, and with as few merely technical terms and statements as the subject would allow, and the whole is finely illustrated by the accompanying cuts. The translation is well made—much more than simply rendering French words and phrases into English—really a reproduction of the author's thoughts in good and pure English language. Altogether it is a decidedly satisfactory work, for any who may desire to thoroughly post himself in the subject.

Within a few years past the Methodist Book Concern published a series of volumes, half-way between history and fiction, somewhat after the fashion of the Schonberg-Cotta books, but of rather more modest pretensions, written by Emma Leslie. They were entitled, severally, "Ayesha," "Flavia," "Glaucia," "Leofwine, the Saxon," "Elfrida," and "Quadratus." They have been well received by the public and largely called for; and, so encouraged, both the fair author and the publishers were prepared for still further ventures in the same line. Accordingly they now send forth a large installment of a new series—three volumes, severally entitled "*Margarethe*," A Tale of the Sixteenth Century; "*Conrad*," A Tale of Wiclif and Bohemia; and "*Cecily*," A Tale of the English Reformation. They are sprightly and well-written books, generally correct in the use of historical facts and events, favoring the Protestant cause at all controverted points, and calculated to promote a cheerful tone of religious life. But, like all books of their class, they make a sad mixing of facts and fiction, which the reader may need some day to divide asunder. The publishers (Phillips & Hunt, 805 Broadway, New York) have brought them out in superb style. On sale also by Hitchcock & Walden, Cincinnati. 12mo. Pp. 324, 293, and 324. $1.50 per volume.

Still more story books from the official Methodist press. No doubt they pay, and perhaps they do some good, but surely there may really be too much of this kind of good

*Lessons from my Masters—Carlyle, Tennyson, and Ruskin. By Peter Bayne, LL. D., etc. New York: Harper & Brothers. 12mo. Pp. 449.

†The Telephone, the Microphone, and the Phonograph. By Count du Moncel, Membre de l'Institute. Authorized translation, with additions and corrections by the author, with seventy illustrations. New York: Harper & Brothers. 12mo. Pp. 277.

things. These two are entitled, severally, "*The Young Folks of Renfrew*," by Miss Ellen M. Tannehill, [A. M.!]—(a line interjected in the title-page gives the information that it is "in the interest of the missionary cause,")—and "*Mordecai's Tenants*," by Mrs. A. D. Walker. These are decidedly clever stories, with a religious bearing, but not especially calculated to enlarge the reader's understanding of realities. They are well printed, and have some fairly good illustrations. New York: Phillips & Hunt. Cincinnati: Hitchcock & Walden. 18mo. Pp. 229 and 142.

THE Scribners have published, in a square 16mo volume of 178 pages, *Friar Anselmo and Other Poems*, by Julia C. R. Dorr. Many of the pieces have already been seen and read by the public, they having appeared in various periodicals. This collection of poems is much above the average of its class in poetical merits. It makes a decidedly good appearance.

THE Carters have brought out, in a miniature volume, an illustrated edition of Gray's *Elegy written in a Country Church-yard*—a woodcut to each stanza; and with the other chief poems of the author appended, not illustrated. It is really a fine little book, both in style and matter.

Empty Churches and How to Fill them, by Rev. J. Benson Hamilton (of Boston), is a stiff-paper covered duodecimo of one hundred and four pages, treating of a confessed though lamentable fact, and proposing remedies which might or might not succeed, if tried. It unquestionably makes some very good suggestions. Phillips & Hunt. 25 cents.

R. WORTHINGTON, 750 Broadway, New York, announces *Aunt Charlotte's Nursery Book*, a holiday gift for young children. It is printed on extra thick paper, with full page illustrations of unusual clearness of design and execution. The letter-press, beginning with rhymes to impress the letters of the alphabet, and including simple stories and poems, is calculated to afford little folks a constant fund of entertainment. It has several cuts which will make it specially appropriate for a Christmas gift, while its artistic merit has a happy influence on the taste.

THE series of "Epochs of Ancient History," edited by Rev. G. W. Cox and Charles Sankey, of Oxford, of which six volumes have heretofore been issued by the Scribners, is justly valued as works of unusual merit. A seventh volume—*The Gracchi, Marius, and Sulla*—has just now appeared;* like all its predecessors, though concise, yet comprehensive, written in pure, strong English, and as truly classic in its literary character as in its subject and as are the sources whence its matter is derived. It is a book to be studied, and yet it may be read as a recreation.

AMONG illustrated books, adapted to the holiday market, George E. Waring, Jr.'s, *Tyrol, and the Skirt of the Alps* (Harper & Brothers), deserves a favorable recognition. It is an elegant speciment of book-making, in its paper, printing, illustrations, and binding; but quite independent of these not unimportant considerations it is intrinsically valuable as a book of travels and observations, with life-like descriptions of scenes and places, and trustworthy historical and statistical information, all told in a lively, natural, and elegant style of writing. It is a capital book for stay-at-home tourists, and will tend strongly to incline its readers to become tourists in fact, as well as in fancy. Large octavo. Pp. 171.

FOR the little folks, the same publishers have issued *The Princess Idleways*; A Fairy Tale. By Mrs. W. J. Hays. Illustrated. Square 16mo. Pp. 124.

THE *Franklin Square Library* has for its latest issues No. 78. The *Talisman*; A Tale of the Crusaders. By Sir Walter Scott. No. 79. The Posthumous Papers of the Pickwick Club. By Charles Dickens. No. 80. Madge Dunraven; A Tale, by the author of "Queen of Connaught." No. 81. Young Mrs. Jardine; A Novel. By Dinah Maria Craik. No. 83. Cousin Henry. By Anthony Trollope. No. 84. Sense and Sensibility. By Jane Austen. No. 85. The Bertrams. By Anthony Trollope. No. 86. The Fugitives. By Mrs. M. O. W. Oliphant. No. 87. The Parson o' Bumford. By George Manville Fenn.

Harper's Half Hour Series. No. 128. The Sunken Rock; A Tale of the Mediterranean. By George Cupples.

* EPOCHS OF ANCIENT HISTORY: The Gracchi, Marius, and Sulla. By A. H. Beesly. With Maps. New York: Charles Scribner's Sons. 18mo. Pp. 217.

Temperance Stories and Sketches—illustrated with pen and pencil, by Edward Caswell (8vo pp. 80) — is a collection of real merit, while the illustrations are of a high average. *The Pledge and the Cross*—A History of our Pledge Roll, by S. M. I. Henry (18mo pp. 259), is a little book, written in the interest of the *Woman's Christian Temperance Union*, by one of its devoted and gifted workers. It is largely made up of proofs of the value of that work, as tested by its results. It is decidedly a good book. Both of the above are from "The National Temperance Society" and Publication House, 58 Read Street, New York.

J. S. OGILVIE & Co., 29 Rose Street, New York, are issuing—much after the style of Harper's "Franklin Square Library"—*The Sunday Library;* with the promise of "A complete moral story in each number." Six numbers have appeared: (1.) Nellie, the Clockmaker's Daughter." By F. M. C. W. (2.) Not Forsaken. By Agnes Giberne. (3.) Bede's Charity. By Hesba Stretton. (4.) Life of Rev. T. De Witt Talmage, D. D. By Rev. John Lobb, D. D. (5.) The Young Apprentice. By Hesba Stretton. (6.) Sheer Off. By A. L. O. E. The reader will detect some old acquaintances among both the titles and the authors. The general character of the works published is that of the Religious Novel,—not excepting that one which seems to be a biography. They are well printed on good paper, and sold for ten or fifteen cents each.

Dot and Her Treasures, by L. T. Meade (author of "White Lilies," "Water Gipsies," etc.), is a pleasant, amusing, and somewhat instructive book for children, somewhat of the fairy-tale kind. 18mo. Pp. 180.

EX CATHEDRA.

ABOUT FASTING.

ON two different occasions this subject has been brought into notice in the editorial department of the NATIONAL REPOSITORY, in both of which the editor has, with entire sincerity, occupied the position of an inquirer. Our remarks have contemplated especially the cases of Methodist ministers, who have placed themselves under vows, to "recommend fasting or abstinence, by precept and example," and of those who, about to enter that ministry, will be required to take upon themselves that obligation. The vows taken at ordination and admission to the Conference are evidently designed to be very thorough and searching, and every thing about them indicates that the words in which they are announced are to be received in their proper and natural sense,—and also in their historical acceptation. Any special or private interpretation of their import is clearly unlawful,—and any mental reservation, on either hand, would be such a species of bad faith as comes very near to untruth. These questions, as they cover only a small part of the duties incumbent on a minister of the Gospel, must be presumed to include only the more necessary and important duties,—or convictions,—that while other things may be left to private judgment and individual convictions of duty, these must be professed as certain and indispensable. They, therefore, admit of neither a negative nor a qualified answer. The clear and unmistakable implication is, that the questions as propounded shall receive a definite and unqualified answer in the affirmative; and from this neither the conference, nor the bishop has the right, either legally or morally, to grant a dispensation, much less to rob the question of all possible sense or meaning by referring it to the "conscience" of the individual. To our seeming the statement of the case given below entirely fails to relieve it of any of its difficulties, however fully it may exonerate the writer from all blame in the affair. Altogether it complicates these difficulties, and adds both emphasis and perplexity to the question with which the writer of the following closes his very frank and able, but to us very unsatisfactory, statement of a momentous affair.

In common with the whole body of our traveling ministers, the writer is under that vow,—for we accepted it nearly forty years ago,—and it has lost none of its force through age. Should we confess that we are living in its habitual violation, we should simply say that

we do as others are doing. Our conferences come together to perform one of its highest and most sacred functions,—constructively "after solemn fasting and prayer,"—though probably not one of those present, from the officiating bishop to the expectant candidates, has at all shortened his diet for the service; and then the bishop speaking, not for himself alone, but for the conference, and the whole Church, requires each candidate solemnly to vow to do what he himself is not doing, and which it is scarcely to be expected that he who so vows will even endeavor to do. There are, indeed, those who doubt not only the right of the Church to make this requisition, but also the fitness, not to say the lawfulness, of self-imposed austerities in religion. But still the vows are upon them,—and more than this, they are, with others, imposing the same vows upon all who come to take part in this ministry. The case is full of perplexities, and it should not be allowed to drift on indefinitely, as it is now doing. Certainly it is "better not to vow than, having done so, not to perform." There are also yet other questions asked and answered affirmatively on these solemn occasions, as to which doubts are freely expressed, even in high places, and by authority. Is it not time that this whole matter should be thoroughly inquired into, and our forms and teachings brought more nearly into harmony? But to our friend's letter:

EDITOR NATIONAL REPOSITORY,—*Dear Brother:* A short paragraph at the end of an editorial on Lent, in the May number (1879) of the NATIONAL REPOSITORY, states that at one of our recent conference sessions one of the candidates for admission into full connection, when asked the question, "Will you recommend fasting or abstinence both by precept and example?" replied that he had not been in the practice of fasting, nor was he satisfied as to its being any part of a Christian's duty. Also at the head of an article on fasting in the August number, is an editorial note making reference to the same fact, and putting into the mouth of the candidate the same reply to the Disciplinary question.

Will you kindly permit that candidate to state the precise difficulty he found in the question, and the exact words of his reply, partly in order to shield himself from being misunderstood, but more particularly to obtain your wisdom upon the point of difficulty itself?

The Discipline prescribes a certain list of studies upon which the candidate is to be examined, and a certain list of questions which he is called upon to answer in the presence of the whole conference [presumably in the affirmative]. Having prepared myself for examination upon the authors named in the prescribed course of study, I turned my attention to the questions I must answer before the conference, with the determination to understand their meaning and scope, and to prepare such answers as would be in accord with my own conscience, without regard to what might be expected by the conference. The fear of being deemed captious would have deterred me from such a course, had I not borne in mind, as your article expresses it, that these questions would "be asked with so much emphasis among circumstances so grave and solemn as surround one assuming the vows of the Christian ministry."

Arrived in my preparation at the question upon fasting, it was plainly my duty to ascertain *what* the question enjoined. I studied the history of fasting as fully as my limited opportunities would allow, sounded my presiding elder thoroughly upon the subject, taxed my memory to recall the practice of the five important Churches in four different conferences of which I had been a member previous to entering the ministry; and, at the end, found myself still anxiously mooting the question with which your editorial closes, "What are the covenanted obligations of a Methodist minister respecting fasting or abstinence?" At length, I was reminded of the canon about interpreting Scripture by Scripture, and resolved to interpret the Discipline by the Discipline.

I found four paragraphs in the Discipline which enjoined fasting, as foliows:

¶ 34. "It is expected of all who desire to continue in these societies that they should continue to evidence their desire of salvation:—*Thirdly*, By attending upon all the ordinances of God; such are,—(6) Fasting or abstinence."

¶ 119. The Instituted (means of grace) are:—§ 4. *Fasting:* "Do you use as much abstinence and fasting every week as your health, strength, and labor will permit?"

¶ 149. "In receiving a preacher at the conference into full connection, 'after solemn fasting and prayer,' every person proposed shall be asked, before the conference, the following questions, namely:—(17) Will you recommend fasting or abstinence, both by precept and example?"

¶ 176. "It shall be the further duty of the preacher in charge:—§ 10. He shall take care that a fast be held in every society in his circuit on the Friday preceding every quarterly-meeting, and that a memorandum of it be written on all the class papers."

I was satisfied that whatever is enjoined by these four paragraphs is certainly among the covenanted obligations of every Methodist min-

ister who answers without qualification "I will" to the Disciplinary question upon fasting. Inspecting these articles closely, I found that the *first* simply enjoined the general duty of fasting, and must be interpreted by the other three; that the *second* fixed two points of this duty for the Methodist minister: (1) frequency, "every week," (2) amount, "as much as health, strength, and labor permit;" that the third and fourth named two special occasions for fasting: (1) The conference must fast before asking, and the candidate before answering the Disciplinary questions, (2) every society must fast on the Friday preceding every quarterly conference.

From all that I had observed, or could learn by inquiry, I was satisfied that I had never seen but one minister who claimed to fast every week, and he was so far from fasting as much as health, strength, and labor would permit, as to interpret fasting or abstinence to mean ordinary temperance; that neither the bishop nor the conference would fast before putting the disciplinary questions to the candidates, nor would any of the candidates fast before appearing to answer them; and that few [if any] preachers-in-charge of Methodist Churches take care that a "fast is held in their societies on the Friday preceding every quarterly-meeting."

Finding then the practice of the Methodist ministry so directly at variance with what is enjoined by the Discipline concerning fasting, I could see nothing but a choice between two evils before me, in case I responded the unqualified "I will" to the disciplinary question: (1) attempt to observe the injunctions of the Discipline, in opposition to well-nigh universal custom, or (2) violate the instructions of the Discipline after promising to obey them. Having, therefore, determined beforehand that I would qualify my answer, when the bishop asked the candidates in the presence of the conference, "Will you recommend fasting or abstinence both by precept and example?" I replied, "I should prefer not to answer that question." Instantly, the bishop modified the question by adding the clause, "as your conscience directs;" to which I responded a prompt and hearty "I will." Further explanation of my objection to the question being called for by some members of the conference, I stated that I understood the question to enjoin such observance of fasting as the Discipline contemplated; that I had never seen it carried out in any society of which I had been a member, and despaired of being able to do so myself; that in fact I was at that very moment one party (the bishop and the conference being the other party, of course) to a breach of the disciplinary requirement concerning fasting. Admitting the force of this last objection, the bishop turned back a single page in his Discipline, and read the heading of the very paragraph under which this question occurs, as follows:

¶ 149. "In receiving a preacher at the conference into full connection, after *solemn fasting* and prayer, every person proposed shall be asked, etc."

Then the bishop gave it as his opinion that this injunction, to fast before the putting of the disciplinary questions, applies not only to the candidates but also to the bishop and the entire conference.

Here the matter ended; and I believe it was generally admitted that my objection was well taken, and the bishop's modification of the question entirely warrantable.

[The objection was indeed well taken; but the "modification" seemed to some who heard it to be very far from "warranted."—Ed. N. R.]

This is an exact statement of the affair as it occurred. I did not declare, nor did I intend to imply that I had not been in the practice of fasting, and was not satisfied as to its being any part of a Christian's duty,—such a declaration would have been false in both parts.

But, as I stated at first, I am less solicitous to correct your unconscious misrepresentation of my language, than I am to get my objection clearly before your mind, and in all sincerity inquire, "What, then, are the covenanted obligations of a Methodist minister respecting fasting or abstinence?" Candidate.

OUR MISSIONARY WORK.

At the usual season, in November last, the General Missionary Committee of the Methodist Episcopal Church came together at their rooms, 805 Broadway, New York, to discharge their high duties for the year, which duties are, chiefly, to arrange the foreign missionary work of the Church for the next calendar year, and to allot the moneys to be used in each of those missions, and also to the several annual conferences of the home Church, for missionary work within their respective bounds. But simple as these duties may appear to be, their proper performance requires not a little earnest study and deliberation; and they call into requisition a great amount of knowledge of facts, and a wise discretion. So extensive a field for action, and such almost infinitely varied conditions and interests can be safely administered only after careful study and enlarged acquaintance with whole range of the facts concerned, and of the principles upon which the whole system is to be managed. It has accordingly been found expedient and, indeed, essential to the highest practical effi-

ciency in the work to keep it as far as practicable in the same hands continuously. The Board of Managers, though an elective body, formerly chosen annually, now quadrennially, has been to a large extent continuous,—in some cases the same persons serving for a life-time. The Corresponding Secretaries, who are the chief executive officers, are elected for four years at a time, but there has never been a case of the discontinuance of any such one by failure to re-elect. Dr. Bangs resigned, Dr. Pitman retired on account of ill health, Dr. Durbin served till thoroughly worn out, and then was retained in an honorary connection with the office, and Dr. Harris left it only when chosen to the episcopacy. These facts are not only significant of the needs of the case, but they also indicate the proper appreciation of these needs by those charged with the ordering of these things. They also speak well for the fidelity of those who have held these important places, and have been able to command and retain the confidence of their constituent and governing bodies, as to both their abilities and their official integrity.

The General Missionary Committee is, after the General Conference, the highest authority in most matters relating to the missionary work of the Church, and both from the method of its constitution and from the positions of the men who compose it, it is probably the most truly representative body in Methodism. The whole body of the bishops are there to represent the general itinerancy of the Church; the corresponding secretaries and the treasurers are there to represent the administration. The Board of Managers and its interests are represented by twelve members chosen from its own body, and the Church at large is represented by other twelve men selected from all parts of the land. These nearly forty men may be presumed, in the persons of some one or more of their number, to be thoroughly informed at all points, and to touch upon every possible interest to be brought into consideration. Their deliberations are, therefore, intended and calculated to bring out and reduce to practice the highest wisdom and the largest appreciation of the whole subject and its demands.

This last meeting was, though apparently less earnest and eventful than some others have been, probably not less important than any other, and the results brought out in the reports and discussions, though less marked by salient points, were especially interesting and highly satisfactory. The year's work has been on the whole successful, both financially and spiritually. The contributions from the Churches had slightly declined from those of the previous year, but only slightly, and the falling off had been more than compensated for by receipts from other sources, by saving in exchange, and by retrenchments, which had been made without sacrificing any real interests. The work had been maintained in every foreign field and in the conferences without unusual curtailments, and in all of them an encouraging degree of success had been achieved.

It would seem to be only the sheerest justice to award decided praise and commendation to the more recent administration of our missionary affairs. At the session in November, 1872, a policy of very liberal expansion was adopted in anticipation of a large increase of funds, especially through the influence of the "eight new bishops and three new secretaries." But the gains so liberally discounted were not realized, and the minority who opposed the policy had the very unwelcome opportunity to record their too well fulfilled misgivings. That policy resulted in a few years in burdening the society's treasury with a debt of nearly a quarter of a million, with which it has now been struggling for all the last quadrennium. The recent financial reverses found the society steadily expending more than its income, which rate of expense could not be suddenly arrested, and so it happened that increasing expenditures and declining incomes proceeded side by side. But a better state of things has been reached—the ship has got out of the trough of the sea—the debt has been brought down to comparatively small proportions, and still the work in all its parts has been carried on without any abatement of its effectiveness, and at the same time increasingly large amounts of the Church's benevolences have gone into other channels.

All these things have been matters of serious and earnest thought with those who have been charged with these great interests; nor have they failed of profitable results. The enforced economy that has been accepted of necessity has turned out to be a not unmixed evil, if, indeed, an evil at all. By a more careful ad-

justment of affairs it has been possible to conduct the work of the society at less cost without curtailing the work at any important point. With abundant funds at hand it is often quite impossible to avoid unwise and injudicious outlays, which operate to the harm rather than the good of the work, inducing an unfavorable state of things among those upon whom it is to be expended. It is not at all certain that the retrenchments of appropriations, made necessary by lack of means, have not operated favorably upon the missions themselves. It is quite possible to over-stimulate the growth of a mission to its damage. *Time* is quite as needful in such a work as is money or any thing that money can procure. Our missions have thus had the needed opportunity to take root downwards, as well as to spread their branches upwards; to develop their own powers and resources, to become self-reliant, which is a condition necessary for true self-respect. More than one of our older foreign missions have in former times suffered by too large feeding; but the society is learning wisdom from the mistakes of its own past experience, and no doubt it is now better prepared to use its means to advantage than ever before.

We have been especially interested in considering the financial aspects of this case, and just here, where some have seemed to see only discouragement, we find the grounds of our largest hope. It is true that there has been some little decline in the amounts contributed by the Churches—our wonder is that that decline has not been very much greater. Almost every one's income has been seriously affected by the financial condition of the country, and during the few past years hundreds of thousands of our people have wanted the simplest means of living. It is the glory and the hope of the missionary cause that it is the one Church charity beyond every other that is laid upon the hearts of the common people, and that lives upon their bounty. But if the fountain is dried up the streams must fail, and even the warmest charity can only give what it has. Many who had been accustomed to give a portion of their incomes have found those incomes cut off, or so much reduced that giving ceased to be even a privilege; and yet, through all these years of terrible depression, the inflow of gifts to the missionary cause has only slightly declined. Both the capital and the aggregate incomes of the whole country fell off by nearly one-half, but the income of the missionary treasury by not over one-tenth—reckoned by the gold standard less than that rate—perhaps not at all. These things demonstrate to us two very valuable truths, (1) The devotion of our people to the cause of Christian missions is deep and abiding, not the impulse of an hour, not a sentiment that is easily cooled, but a steady and enduring religious conviction, which may be trusted for all times and changes; and (2) The administration of the missionary affairs of the Church enjoys the confidence of the people. They find in it a safe and trustworthy agency for accomplishing the great work of preaching the Gospel to every creature, in which all true Christians desire to have a share.

In view of all these things the outlook is eminently hopeful. There may be less of sentimental display and oratorical clap-trap about missions in the future than there has been in the past, but there will be more of deep, honest conviction, and of doing from conscience rather than from temporary impulse. Christians are coming to feel that the missionary work is an essential part of Church life, and with that conviction will come a better experience, more steadiness of active consecration, and more money.

SPECIAL attention is invited to this month's "Editor's Study." Its signature will indicate that it is the production of one who has before appeared in the same place, discussing a subject nearly related to the present one. While the editor is not to be understood as indorsing every thing that may appear in that department, he is quite free to say that he sees in the subject there discussed sufficient importance to justify its thorough examination; and so long as the discussion shall be conducted in the spirit of thorough loyalty to the Church, and all its great interests, as we know is the case in this instance, only good can come of it. It would, indeed, be a sad day for Methodism if ever it should happen that its own faithful ministers and members could not examine into its affairs without incurring the suspicion of "disloyalty." And precisely this point of the composition, powers, and conduct of the annual conferences is that to which the Church will do well to direct its earnest attention.

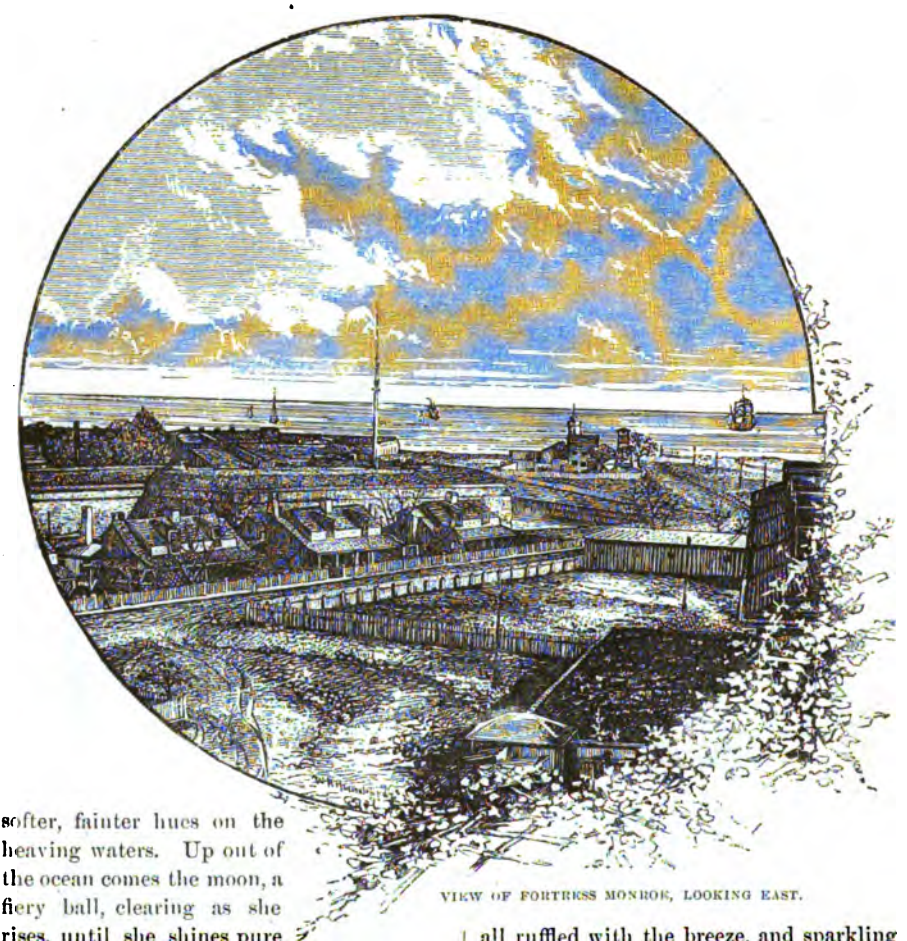
NATIONAL REPOSITORY.

FEBRUARY, 1880.

THE RIP-RAPS.

AROUND OLD POINT COMFORT.

N a certain bright Tuesday in October, year not given, we find ourselves (who we are is a matter of not the least possible concern to any body) on board of the *Wyanoke*, bound for Old Point Comfort. After the soft balmy days during which the Autumn has been putting on the juvenile airs of Spring, the year has suddenly come to its senses, and, realizing that "its life is in the sere and yellow leaf," has taken on the pleasant crispness appropriate to the latter part of October. A brisk breeze ruffles the surface of the broad bay into life and sparkling beauty, but the steamer glides on steady keel past the forts and the little islands, past the light-houses, out to the long swell and flow of the ocean. The sun sets in clouds of golden glory, billows of rose and amber in the western sky, long streaks and twirls and twists of radiant color shining in



VIEW OF FORTRESS MONROE, LOOKING EAST.

softer, fainter hues on the heaving waters. Up out of the ocean comes the moon, a fiery ball, clearing as she rises, until she shines pure and fair above us, pouring over the dark blue sea her trail of rippling silver. We wrap ourselves in cloaks and shawls and cower on the sheltered side of the smoke-stack to watch the solemn splendor. Our voices are low and hushed, as the night wears slowly on, and only the sky and the sea flooded with pure white light are around us; and the wild sea wind shouts his jubilant music in our ears, and swings our cradle lightly with soft touches of his mighty hand.

The morning rises fair and radiant, and the good ship churns her foamy way under deep blue skies, across which the swift wind hurls masses of gleaming pearly clouds. To the west the land shows low and faint; to the east is only the broad sea of steely gray, all ruffled with the breeze, and sparkling in the sunlight, curiously barred as it nears the horizon with streaks of pale, weird green.

The day is half gone when the word reaches us that we are passing between the capes. We strain our eyes to discern Charles and Henry, grim sentinels that guard the portals of Virginia, each with his nightly crown of flashing light. Almost two and three-quarters centuries ago (1606) they were first discerned by old Christopher Newport after his terrible four months' voyage, and still they stand unchanged, while the princes in whose honor they were named have long since slept,—

> "Deep in dim death where no thought stings,
> No record clings."

What queer little light-houses dot the surface of Hampton Roads, low and squat, propped upon straggling legs and looking,

from the distance at which we gaze upon them, like huge uncanny spiders.

Boom! goes the little gun on the forward deck, as we glide past gray Fortress Monroe. Boom! boom! go the great guns from the ramparts, but not in answer to our salute, for to that the grim old fort deigns no reply. The artillery school are practicing on the ramparts, and shot and shell go screaming away over the water, though not until we are safely out of range. We have reached Portsmouth where we disembark, and take the Baltimore boat back to Old Point Comfort.

"A '*point*,' evidently, and '*old*,' probably; but how about the '*comfort?*'" one asks involuntarily.

It was in 1608, two years after Christopher Newport christened the capes of Virginia, that Old Point Comfort received the name which it still bears. Captain John Smith of Pocahontas memory was its sponsor, but whether he foreswore for it "the world, the flesh, and the devil" may well be doubted. Certainly he would gladly have foresworn "the murdering Indian devils," from whom he and his little band of explorers (part of Newport's expedition) were fleeing when they were overtaken by a storm on the broad bosom of Hampton Roads. The little boat tossed helplessly upon the raging waters throughout the night, and the worn and weary mariners, hopeless of succor, had well-nigh given themselves up to despair. Morning broke at last and its first rays showed them a long low tongue of land to which they turned their strained and weary eyes, giving to it the name of the feeling which it brought them, "Comfort."

The moon has risen and we are nearing our destination. Before us, at the end of the long dark wharf, the pretty Hygeia Hotel sparkles with lights. On the dock lanterns are flashing, and indistinct figures move hither and thither, their voices blending with the low murmur of the surf which breaks creamy-white upon the beach. Three soldiers, their trowel-bayonets flashing in the moonlight, pace their monotonous round between us and the shore, for Old Point Comfort is a government reservation, and we are now under the heel of a military despotism. With flashing wheels and glimmering lights the huge boat steams slowly away from

THE HYGEIA HOTEL.

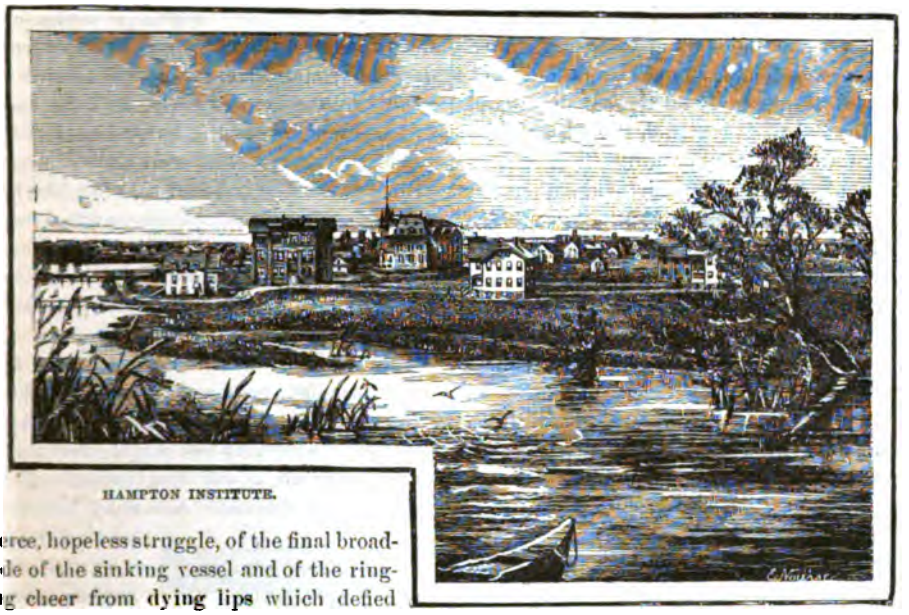
INTERIOR OF THE FORT.

the wharf, the crowd disperses, the soldiers shoulder arms and march back to the fort, and we wend our way to the hotel where rooms have already been secured. We have breakfasted, and from our window we look upon that glorious sheet of water, Hampton Roads, one of the finest and safest anchorages in America or the whole world. Just away yonder is the place where the crew of the *Cumberland* went down to their death. Indeed, some of the most stirring memories of our country cluster around this spot, and every inch of it is "sacred soil." But the bugle calls, and we suppose that something is going on there. It is only guard mounting, and we watch the brilliant scene while the band rings out its stirring strains and rank after rank of men, their bayonets glittering in the sunlight, come up at the double-quick to take their places.

We walk around the water-battery along the edge of the sullen moat; we look at the long row of embrasures, each with its grim black gun, silent and motionless now, but ready to pour its avalanche of death; we pass in over the draw-bridge, where the sentinel paces, and under the solid arch-way. A fort, a village rather, with its broad expanse of greenest ward, shaded by live-oaks—rather scrubby they might look to southern eyes, but they answer their purpose. It is almost impossible to realize that we are not wandering over some shaded village green, surrounded by pretty cottages and the little church with its slender spire, for all the world like a tower in a box of German toys.

"A fortress," says Peter Parley, or some other equally competent authority, "is properly a fortified town, or a fort large enough, and intended to afford a permanent residence, for other than its garrison"—a sort of irregular superlative of *fort*, perhaps.

This fortress was begun in 1817; but the advantages of the situation were perceived by the first settlers, who erected a small fort here in their rude primitive fashion as early as 1629. We climb to the ramparts by the broad slope up which the guns are dragged, and higher yet mount the parapet by the aid of one of the gun-carriages. Hampton Roads lies below and around us, a sheet of shimmering silver under the eastern sun, the broad, calm, beautiful harbor over which flocks of snowy sails flit lightly, and steamships ply their ponderous way, and brisk little steam tugs bustle about. Out there, in the midst of the water, is the Rip Raps, upon the unfinished fort on which the government had just expended a fortune when the new style of artillery came up, before which the ponderous walls would be but as a fragile toy. So the work was suspended, and the desolate little artificial island, with its magnificent beginnings, lies there forlornly like a grand life blighted into uselessness forever. Yonder, to the right, opens the James River and the cape at its mouth is Newport News, named for brave old Christopher. That is the precise spot where the *Cumberland* went down with colors flying and where she still lies proud and unpolluted in her watery grave. We gaze dreamily at the glittering waters as we think of the tragedy of that 8th of March, 1862, of the



HAMPTON INSTITUTE.

fierce, hopeless struggle, of the final broadside of the sinking vessel and of the ringing cheer from dying lips which defied the foe, even as the waters were closing over the fated vessel. Then our eyes wander away to the left where Chesapeake Bay opens out, and away on the horizon as moving lines of misty light show us where heaves the broad Atlantic.

We descend from the ramparts, and wander again over the seventy acres which the fort incloses within its massive walls. We wonder at the apparatus which, before the ball strikes the target, has measured and recorded the velocity of the shot; at the simple means by which the explosive force of powder is tested; the Gatling-gun, said to be equal to a whole regiment of foot-soldiers, a simple but terrible engine of death; the museum with its collection of arms of all ages and countries. The afternoon is waning and there is the sound of great guns. The artillery school are practicing upon the ramparts, and we hasten to see them. Seated at our ease upon the ramparts, crushing out at every motion the pungent odor of the wild garlics which grow thickly amidst the grass, we watch the officers and soldiers who group themselves against the sky and make unconscious pictures for our appreciative eyes. Boom! goes a mortar, and with a long screaming hiss the shell flies over the water, pauses and bursts into a puff of pearl-tinted vapor against the deep blue sky, while the iron fragments shower around and over the target which dances far out upon the sunny water, and boom, comes back, faint and far, the echo of the report with which it burst. Now a round shot goes skimming along, sending up a flashing fountain of spray as it plunges sullenly downward at the end of its curving flight. But we like the shells best, and we watch them untiringly until the practice is over. That erect, gray-haired old man with the sergeant's stripes upon his sleeve, is Sergeant Welsh, one of the best gunners in the army. He it was who, during the war, shot away the Confederate flagstaff from Sewall's Point, five miles distant. He was offered a captaincy for the exploit, but the shoulder-straps did not dazzle the brave old man. He refused the offer of promotion and clung to his humble stripes and in so doing glorified them.

Though Hampton is only three miles away, we have not, at the end of three days, yet been there. We are not doing our duty in the way of sight-seeing. But the time slips away so pleasantly as we dawdle about the fort with its fascinating suggestions of the time when the peaceful inclosure

was all astir with the fierce commotion of war, when the great guns thundered from the walls and the stars and stripes flaunted their proud defiance to the stars and bars. The sun shines gayly on the parade ground and the light leaves glisten in its beams, the shadows of the mighty walls lie dark and heavy along the golden turf and gather sullenly in angles and arch-ways. Peace reigns again in the land and the old fort holds its peace, with never a murmur from the iron lips which once rang out the victory for a nation. Sullen and still, like a crouching lion it lies, biding its time, which Heaven grant may never come again.

Only a few weeks ago it was all astir with a different kind of life. Then the hotel was crowded with guests and the fort was alive with visitors; and rides and drives, hops and concerts, boating and bathing made the days and nights a continuous round of varied amusements. The season is over now, and, save for a few tourists *en route* for Florida thus early, and the families of the officers at the fort, none of whom we know, the place is well-nigh deserted. Somehow we like it better so. We like the sense of ownership which comparative loneliness gives. We feel like setting up our flag and taking possession by right of discovery of the nooks and corners into which we stray.

But at last we are off for Hampton. We drive over the causeway and the long bridge where the weary sentinel only glances at us as he plods slowly up and down. Not much to see, after all, is our first thought when Hampton is reached. A shabby rambling place with worn, dusty roads, generally destitute of sidewalks, winding about promiscuously among the rude cabins which principally compose the town. It was burned by Magruder lest it should afford aid and shelter to the Union troops.

THE DOCK.

We are told much of the beauties and glories of Hampton in the days before the war. It may all be true it is hard to prove or disprove, for only one of the original houses is left standing

That is an old-fashioned building of brick, stained and darkened by time, respectable but by no means imposing. If we are to believe the report of an eye-witness, Hampton could not have been altogether a paradise even before the conflagration.

"The town," he writes, "bore no evidence of thrift. It looked as though it were sleepy and indolent in the best of times, having oysters for its chief merchandise. The streets were paved, but the pavements were of large irregular stones and unevenly laid. Few houses were new and, excepting St. John's church, the public edifices were mean."

We pause before old St. John's Church, dingy and primitive, interesting only from its extreme age, the bricks of which it is built having been brought from England for the purpose in 1660. It has twice been destroyed and rebuilt, but always with the original bricks. The old grave-yard, with its weather-stained, mossy stones, some of which date back as far as 1701, is all overgrown with weeds and briers and defaced by traces of the late war. The quiet old graves, which hold their buried treasures in such gentle but tenacious clasp, what tales they might tell us if they could but speak of the scenes that they have witnessed while the flood of life has swept by and left them unchanged; of days when the red Indian prowled by night and the white man watched in fear and anguish; of proud old colonial days, when the distant country from which these bricks were brought was "home" and father-land; of golden days of peace and prosperity; of dark days when the red tide of war poured over this quiet spot! But the dead are dead, and the hoary stones tell no tales, and so silently we pass through the iron gate and leave the sleepers to their voiceless rest.

I look around and try to picture to myself faintly some of the scenes which have been enacted here, try to feel myself on historic ground trodden once by feet of Pocahontas and Powhatan, of John Smith and brave old Newport; try to conjure up the "Spirit of '76," as I think of Cornwallis "marching up and down Virginia stealing tobacco;" try even to bring back the feelings of a short few years before, when Butler, in yonder fortress, solved the problem of a nation by the utterance of the one word "Contraband," and that word, caught up by every loyal wind of heaven, flew far and wide throughout the land and stamped itself upon a race.

Back flies my errant fancy to that 24th of October, 1775, when the inhabitants of the town of Hampton, loyal Americans or British rebels as you choose to call them, saw Captain Squire's six tenders sailing up the creek. My heart beats with the hearts of the watchers who see the boats filled with armed men put off from the ships and pull swiftly to the shore. Poor, paltry little town! What can it do against this powerful fleet? Never a cannon have they, never a rampart to turn back the deadly balls from those grinning muzzles. Only their hunting rifles and their high, undaunted hearts—"Lord, what are they against so many?" And yet—and yet the battle is not always to the strong. Hidden behind fences, lurking behind bushes and shrubs, are the men of brave old Hampton. The boats approach, they touch the shore, when suddenly from behind bush and shrub and fence leaps a shower of bullets. Straight and true they come, and "every bullet has its billet," and for each report a foeman drops. And, look! disorganized, demoralized, the British turn and flee back to the tenders which swing lazily at their anchors. Through the rain Captain Woodford, at the head of one hundred of the Culpepper militia, is marching to the relief of Hampton. When the gray dawn breaks the tenders have crept up close to the shore, and now a ringing broadside is poured through the quiet streets. And again from fence and bush, and shrub, leap the deadly bullets, straight to their mark. Not a sailor, not a gunner can show himself, for ever so brief an instant, but he drops with an ounce of American lead in his heart. The crews cast themselves face downward upon the decks, groveling there in their hideous panic to escape the certain death which a motion will bring upon them. The commander of one of the tenders leaps overboard in his terror and swims to the oppo-

THE CONSERVATORY—SOLDIERS' HOME.

site shore. The other tenders endeavor to draw off, but two of them drift ashore and are captured. The British are hopelessly routed in this their first battle upon Virginian soil—routed by a handful of Virginians armed only with their old-fashioned hunting rifles.

Time has drifted on. It is now the year of grace 1813. All day the fight has been raging about Craney Island. The British have been defeated with slaughter, their boats sunk, and the drowning men saved only by the magnanimity of their victors. Maddened with the shame of their defeat, they seek an easier prey, and their eyes fall upon poor little Hampton. Not so fortunate is Hampton this time. The heart of Virginia beats as high as ever, but the odds are overwhelming. Captain Pryor who commands the central battery (American) sees that the day is lost. Only one chance of escape remains. He spikes every gun in his battery and then, at the head of his force, charges upon the detatchment of royal marines which is advancing to crush them finally, cuts his way through, swims the creek, and escapes with the loss of twenty of his men, while two hundred British soldiers bite the dust. And then—cover your eyes and stop your ears, for poor Hampton, with its helpless, defenseless inhabitants, is in the hands of an enemy which knows no mercy. You can guess what that means for the women, the children, and the sick who are left to take care of themselves in the hapless town.

But Hampton's annals are not always glorious. It was in Hampton Roads that the first slave ship was seen. In 1620 a Dutch man-of-war brought "twenty negars" from Guinea, and from this tiny root sprang the upas-tree of American slavery. It was, therefore, a kind of poetical justice that in this very region where slavery first found foothold on American soil should be the place where the negroes with pickax and

spade struck the first blow for their own freedom by working on the trenches and embankments, under the direction of their protectors, for our army.

"The mills of God grind slowly,
But they grind exceeding small."

"I must tell you a story which I heard the other day," said one of our company, "as we drive homeward. I am sure of my facts, but if the technical details are not quite right do n't be too hard upon me. It was during the war, and the heroine was a Miss X——, of N——. They were all rebels, she and her family, and her father and brothers were, of course, in the army. Miss X—— heard that her father and, I think, two brothers were ill and probably dying, in one of the Southern army hospitals. She was nearly frantic at the news; felt that she must get to them, but could see no way until a Northern officer, taking pity upon her, passed her through the lines. She reached the place where they were; nursed them back to health, or buried them, I forget which, and returned in safety. It seems, however, that the general who was at that time in command of the fort had heard of the affair. He sent for Miss X——, and ordered her to give up the name of the officer who had helped her, telling her that unless she did so he would send her to Hatteras and keep her there for six months on bread

THE GOVERNOR'S FAMILY.

CARROLL HALL, CONFINEMENT PLACE OF JEFFERSON DAVIS.

and water. She replied that she would die before she would ruin the man who had befriended her. The general—brute that he was—actually carried out his threat, and sent her down to that awful, desolate place, this delicately nurtured lady, to be the only woman in the garrison. Now comes the best part of the story. In some way the story of her heroic refusal had preceded her, and when she arrived there, beaten down with fear and horror, she found that the whole garrison had turned out to do homage to her. She was received with military honors, and treated like a queen during her entire stay. The officers of the fort then sent a report of the case to Washington, with a petition for her release, which, of course, was promptly granted. In six weeks she was at home again, but her hair, which had been black when she left for Hatteras, was perfectly white on her return."

So runs the story, and you will ask, was it true? If it is n't, it ought to be, you think; and so let us believe, even though we may be hereafter assured that it is only a fiction.

The next morning we devote to the National Soldiers' Home. It is a bright, clear day with a fresh north wind blowing, which tosses the sparkling water into blue, foam-crested waves, and sets the blood in our veins dancing in unison. Brightness and bloom, glitter and gayety, rainbow-hued flowers, gray-clad veterans sauntering about or basking in the sunshine—such is the scene we see when the Soldiers' Home is reached. The principal building on the grounds was formerly a girls' boarding-school; but now the figures of the old soldiers stalk, with

their stiff, military gait, through the halls and corridors where once flitted the light forms of the "sweet girl graduates in their golden hair." Here is the bowling-alley, where two of the veterans are just bending their stiff figures to send the balls whirling up the center with a whizz and a clatter, laughing like boys at the wild havoc wrought among the pins. The billiard-room and the store are successively visited. In the latter we are struck by the stock of varieties provided — hair-oil, sleeve-buttons, fancy ties—most innocent and ornamental weeds, softening the rough spots of human nature, and draping its harsh outlines with delicate, clinging tendrils. We linger about the buildings and the grounds, gaze from the cupola upon the bright scene around, sweeps of greenest turf, diversified by beds of glowing flowers laid out in the shape of the badges of the various army corps; pretty buildings peeping up among the trees, the whole set in a frame of blue, sparkling water which gives the last touch of life and beauty to the scene. We loiter through the greenhouses and listen to the old gardener's loving praises of his floral darlings.

While we are here a rough-looking man approaches Captain W——, who is with us. He proves to be one of the divers engaged in the work of raising the *Cumberland*. How near, how very near it seems to bring the times and feelings which we have well-nigh outgrown when he hands to the captain a candle which he found in her cabin. It is moldy and hard, almost petrified by its long submersion, covered with barnacles and reeking with the smell of the brine in which it has lain so long. Captain W—— cuts it in two and gives half of it to one of our company, and the girl handles it tenderly as a sacred relic.

"There is a petrified man in the cabin too," adds the diver cheerily, "and we are trying to get him up whole."

Not far from the Soldiers' Home is the National Cemetery, where lie six thousand of our brave dead. Nothing but rows and rows and rows of graves, a brown ridgy wilderness bristling with the white, wooden stakes on which all that is known of the dead below is inscribed. Among them is the grave of the Swiss nurse, Alexander, whether Mrs. or Miss we know not, whose touching prayer that she might be "buried with her boys" has been granted.

"Unto each man his handiwork, unto each his crown,
The just Fate gives;
Whoso takes the world's life on him, and his own lays down,
He, dying so, lives.
Whoso bears the whole heaviness of the wronged world's weight,
And puts it by,
It is well with him suffering, though he face man's fate.
How should he die?
Seeing death hath no part in him any more, no power
Upon his head;
He hath bought his eternity with a little hour,
And is not dead.
For an hour, if ye look for him, he is no more found,
For one hour's space,
Then ye lift up your eyes to him, and behold him crowned,
A deathless face.
On the mountains of memory, by the world's well-springs,
In all men's eyes,
When the light of the life of him is on all past things,
Death only dies."

Every one has heard of the Hampton Normal and Agricultural School, the pioneer enterprise for the elevation of the colored race. It sprang from a very tiny root, this wonderful tree, but its roots have struck deep into the soil, and year by year it has gone on growing and spreading until the land is filled with the fame thereof. I wish I could paint it as we saw it. I wish I could tell you the feelings that swelled our hearts as we went through school-rooms and sewing-rooms, pantries, bath-rooms, printing rooms, chapel, and dormitories. I wish I could show you the bright, intelligent faces, black, brown, and yellow, yes, and purest Caucasian white, which crowd the class-rooms. I think that one reason of its wonderful success is, that unlike too many philanthropic enterprises, it is founded upon good, practical common sense. The plan of the work was brought from Hawaii, and the general principle which underlies it appears to be that the colored race must work out its own salvation. But for this to be possible a fair start must be given it, and to give it this start is the aim of the school. To provide thoroughly competent colored teachers, farmers, mechanics, who shall go out among their

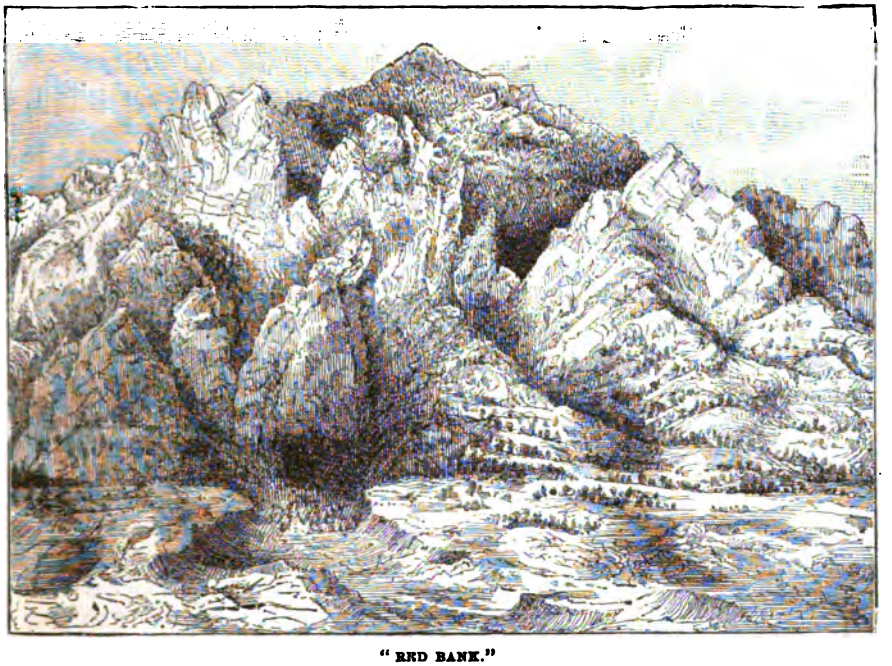
NATIONAL CEMETERY.

own people to proclaim and exemplify the gospel of work, this is what these teachers are giving their lives to do. Only a little leaven now, but who can doubt that there is life enough in it to leaven the whole lump? Not for years, not for generations, perhaps, but sometime the cruel knot must be cut, and the cruel wrong must right itself, and the negro find his true place in God's creation. Where is it? What is it? Time will tell; Time, the Œdipus who alone can read us the riddle of the life that now is.

And now, though we have very partially done our duties as sight-seers, yet we must really go home. There is the Norfolk Navy Yard, which we have not even glanced at—within an hour's sail, too. But we can contain no more. Soon we are flying homeward by rail through the soft, Indian Summer air whose breath fans us like the Summer zephyr, between fields that lie brown and crisp beneath the first breath of frost. The woods are still decked in their most gorgeous hues, gold and scarlet, crimson and amber, all blended into softest harmony by the pearly haze that fills the air through which the sunlight filters with a chastened glory.

Summer is gone; our journey is over; but the bees have gathered their honey, and we have garnered our memories.

AMONG THE FOOT-HILLS.



"RED BANK."

TO most people, going for the first time across "the plains," the trip doubtless seems much like a transit to not only a new, but quite another country. That great American Desert of ours is but the border territory lying between two distinct and diverse geological and climatic regions, and separating them quite as effectually as if it were an extent of water rather than land. To me, at least, this impression was strong, and when, after a safe journey across the sandy reaches, I was at last confronted by the Rocky Mountains, with their mighty upheaval of rugged ledges and snowy peaks, the sense of strangeness and of remoteness even could hardly have been greater if I had crossed the ocean, and stood in the presence of the Alps; and I entered Denver by the Kansas Pacific with much the same feeling as if it had been a foreign city.

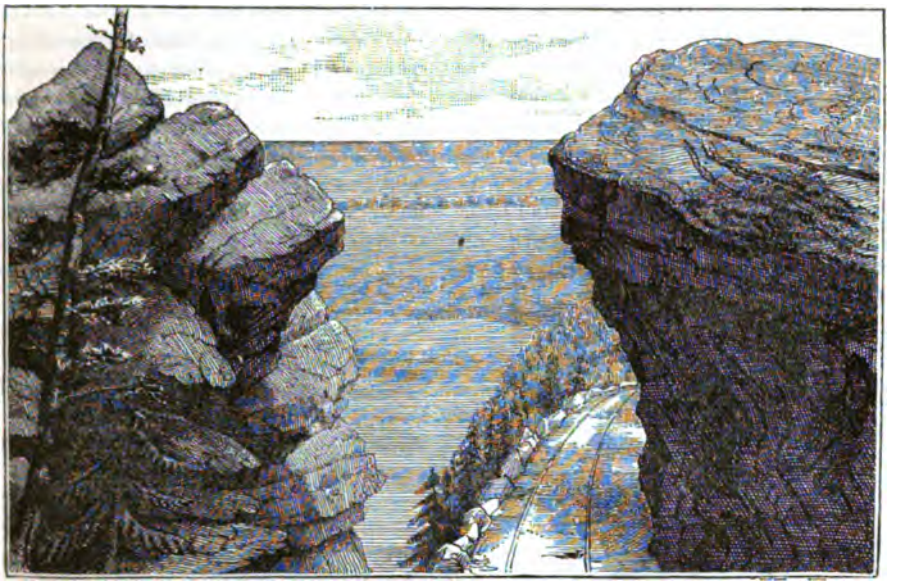
Nor is the suggestion of the ocean an irrelevant or far-fetched one; for that great expanse of barren land, bounded only by the sky and resting as it often does under a misty light, might readily be likened to the boundless expanse of the sea, and its billowy undulations can, without much stretch of the imagination, be made to recall the rolling billows of the "vasty deep." Once upon the other side, the feeling was strong upon me that between me and familiar haunts there stretched a not insignificant sea. One can well imagine that in the old-time days the poor immigrants must have watched for the first glimpse of the mountains with much the same longing as that with which the home-sick mariner watches for the first glimpse of land.

There is not a little to interest one in a first experience of the plains, though one day is quite sufficient to exhaust the novelty and create a satiety that at length becomes irksome. After one has seen a few flocks of antelopes, and had a good laugh at the funny little prairie-dogs and their curious little homes and ways; after having encountered a genuine sand-storm in a transfer from the sleeper to an eating saloon, and specu-

lated as to the interior comforts of the occasional "dug-outs" or "adobes" by the way; after being several times aroused into fresh interest by the sight of a train of emigrant wagons toiling slowly westward, and exciting one's compassion with the reflection that what is to take us but a comparatively few hours on the wings of steam, will require weeks for them to accomplish at that tedious pace, and conjuring up to the imagination all the romance as well as the terrible reality of the ante-railroad days, when to cross the plains might well be considered the event of a life-time,—after all this, one settles into a condition of monotony in which the very first sign of civilization is hailed with a delight not unmixed with chagrin when it presents itself in the shape of the inevitable "SOZODONT," staring at one in huge type from the high board fence of the race-course on the outskirts of Denver, and forming an absurd foreground to the mountains beyond. Think of gazing at glorious Pike's Peak over such a prosaic label as that! Twenty-four hours of the desert stillness have the effect of making the life and stir of Denver seem most agreeable. Yet one can not help speculating a little as to whether, after all, the remarkable alertness, especially of the railway and hotel attachés, is altogether due to the inspiring effects of the climate, or is partly the result of a laudable effort on their part to make an impression upon the eastern mind as yet unaccustomed to such abounding energy. Doing things "for effect" may be a legitimate art, as certainly it is an important factor of success in life; and if Denver is to be the important city that all her people tell you of, she should neglect none of the means to that desirable end. Even the four handsome, white horses attached to our railroad omnibus seem to be animated by the general spirit as they dashed through the streets, turned sharp corners, and drew up at the hotels, in a way that indicated truly commendable equine aptness in the art.

LOOKING UP BEAR CAÑON.

Boulder, however, some forty miles by rail to the north, and not Denver, was our point of destination; and here I found myself in a dilemma. Several detentions on the way had brought us into Denver on Sat-



AN OUTLOOK FROM BEAR CAÑON.

urday, and too late to make connections with the northern bound trains. Should we spend the Sabbath there, or should I overcome my early scruples as to Sunday travel, and complete the journey on the following morning? I argued the matter with myself with, perhaps, a slight bias on the side of self-interest as against conscience. I had an invalid in charge, and was anxious lest sickness overtake him before being comfortably settled. Then there were the two patient horses which three times, at least, must have traversed the three miles to the depot on a fruitless expedition, and I had not lived several years in New York under the influence of a Society for the Prevention of Cruelty to Animals, not to feel compassion for the poor beasts. There were, besides, other considerations; so I conquered my scruples and went forwards.

The train was scarcely started, when detained by some accident. I suppose under the circumstances the appropriate thing to have done would have been to recall all the dreadful things that had happened to naughty children who had persevered in breaking the Sabbath, and applied to myself the lesson, but I chose rather to see in the occurrence a favoring providence which detained the train a whole hour and a half for the express purpose of giving me the privilege of sitting on the rear platform of the cars in the still Sabbath air drinking in the beauty of those wondrous mountains. They then and there so imbued me with their subtile enchantment that I felt myself swayed by it not only during my brief visit, but long after I had taken a final adieu, and was on my homeward way, where I found myself envying each incoming tourist who was so soon to enjoy what I was so reluctantly leaving. There in front lay the long line of Foot-hills, making a gigantic wall which seemed like a huge breastwork to the snowy range lying beyond, and forming an apparently unbroken chain as far as the eye could reach. Against the clear blue of the sky their whiteness was singularly effective, and in the rare purity of the air each rugged feature of the Foot-hills stood out in vivid distinctness. Nor will it be easy soon to forget the return trip to Denver, some days afterward, when over the entire mountain range rested a bank of snow-white clouds so interpenetrated by the glistening peaks that it was no easy task to define where the mountains ended and where the clouds began.

Boulder is a goodly town with a thrifty aspect. In the matter of situation it is particularly fortunate, lying as it does near the mouth of the famous Boulder Cañon, and directly under the giant Foot-hills which seem to stand guard over it. But it was Colorado ranch life, and not the towns, with which I was to familiarize myself, and I can only speak of Boulder as to its external aspects. When one's preconceived ideas have been sufficiently adjusted to actual facts to comprehend that, in general features,

A ROCKY MOUNTAIN YOUTH.

a Colorado ranch (except as devoted exclusively to stock raising) is much like a large farm elsewhere, and that a "corral" is but another name for a magnified New England barn-yard, minus the barns, there will yet be enough points of difference to enlist one's interest.

In the matter of irrigation, an important one in a country subject for months together to a dearth of rain, there is decided novelty. Think of five miles of irrigating ditches on a farm of one hundred of sixty acres! It would be difficult to compute the number of steps it must take to so regulate these ditches that there shall be an equal distribution of water when, perhaps, in order to do so requires that it shall be turned off from the strawberry patch to supply the wheat field in a remote corner of the farm; and that the corn field in another distant part shall not have more than its share, it must yield to the necessities of the potato patch, the flower-beds, or the corral, and so on, until the balance between demand and supply is evenly adjusted. It is a fortunate circumstance, however, that this is in a climate that makes exercise a pleasure rather than a labor. The manner of irrigation is on this wise: A main ditch is dug connecting with some mountain stream, and from that supplies are carried to contiguous farms in smaller ditches, to be distributed by yet smaller ones on the farm itself. As the county becomes more thickly settled and the demands for water supplies increase, the necessity for more or less litigation on the subject will doubtless increase also, in order that those unblessed with conscientious scruples may not get more than their share.

One is at once reminded of the fact of being in a strange country by the appearance of the wild flowers. They are beautiful and abundant, and, with few exceptions, unfamiliar to Eastern eyes. All through the fields clusters of the beautiful "Star of Bethlehem," a frail, stemless blossom of velvety whiteness, look up in open-eyed welcome, and flowers of every hue tempt one to pluck long after their abundance becomes a burden. Along the lower slopes and up the gorges of the mountains one can gather bouquets of such beauty and variety as would gladden the heart of a botanist, only to throw them away with regret that some herbarium can not be enriched by them. This is the advantage of visiting Colorado early in the Summer, before the dry season has burnt them out in the valleys and plains. Farther up the mountains when the melting snows swell the streams and fertilize the soil, they bloom in abundance all Summer.

The birds, too, are unfamiliar, with the exception of the moaning doves and the meadow larks, which seem more numerous

than at the East; their rich notes at all times of the day, and especially towards evening, springing upward, until the whole air seems filled with music. There is a bird said to be well known also in the older States, evidently of the snipe species, called the "Killdeer," which has a weird habit of hovering about one during an evening walk, and attracting attention by its cry, which seems to come almost from beneath one's feet, when in reality it is many rods away. The red-winged blackbirds, so well known in the old Middle States, but not so common in the Ohio and Mississippi valleys, are found here in abundance, with their songs, made up of the chirping of the crow, blackbird, and the clattering music of the bob-o-links, cut short in the midst. A whole flock of them would daily take possession of a cotton-wood grove on the ranch which I was visiting, and make it lively enough with their musical chatter. The cottonwood appears to be the principal and almost the only tree indigenous to Colorado. Its growth is scanty, its distribution being confined to the streams, and occasional clumps which have been planted upon the windward side of the farm-houses to protect them from a too familiar intimacy with the mountain breezes. One misses the abundant trees of other regions; but one can't have every thing, and if there were groves, where would be that wondrously dry atmosphere, the clean sweep of the wind, which is so inspiring, and that sense of freedom which comes from a far-reaching vision? Nature is ever ready to equalize her gifts; and if she is here niggardly in the matter of fire-wood, she is lavish in her sup-

IN BOULDER CAÑON.

A ROCKY MOUNTAIN ZEPHYR.

ply of coal. In the neighborhood of Boulder there are vast stores of it. It seems odd in looking over the smoothly rolling bluffs to see the black out-croppings which mark the places where these coal-beds lie. In substance it is soft, and easily decomposes when exposed to the air. But it is of an excellent quality, and a great blessing to the farmer who, by driving to the coal-beds, can at the low rate of a dollar and a half or two dollars carry away a ton of it.

But, after all, the great treasure of Colorado—better than her coal, her silver, or her gold—is her fine health-giving climate, the rare purity and invigorating qualities of which act as a tonic to debilitated systems, and stimulate into fresh activity already healthy ones. All this has been too often expatiated upon to need another description. One can scarcely go there and not feel as if endowed with a new lease of life; and that, perhaps, after all, the celebrated elixir of youth is not an unattainable boon.

When walking becomes a downright pleasure, and other exercise of even more than ordinary severity is unaccompanied by any sensation of fatigue, one may well be pardoned for becoming enthusiastic over conditions that conduce to such happy results. Of course, this is only generalizing. These conditions, like all others, are subject to exceptions, and, in Colorado as well as elsewhere, one may be afflicted with many of the ills that flesh is heir to. Then, too, that freshly blowing breeze that sets the nerves to tingling with new life, can augment itself to a storm that is truly formidable, or convert itself into a tornado against which man and beast alike stand in helpless dismay, or flee before it in terror. But for the most part it is a good-natured wind, and is so almost caressing in its touch that one can no more get angry with it than with the playful teasing of a child. Towards evening it is particularly agreeable. All day, perhaps, it has been blowing in over the heated plains, and coming in contact with the mountains becomes tempered to just the proper amount of coolness. It has some eccentricities, however; one hears during the night a sudden roaring among the mountains, which increases in loudness as it comes nearer. Then there is a din of all sorts of objects flying about the house, among which is noticeably distinct the clatter of pans and milk pails left in supposed security outside; but just as one has nerved oneself up to encounter nothing less than a tornado, the hubbub has subsided, to be followed, by an interval of an hour or more, when another gust will arise as suddenly and subside as quickly, to be followed by another lengthy lull. These sudden gusts, with long intervals of calm, seem to be characteristic of these mountains. It is said that when a white-capped cloud, be it ever so small, thrusts its innocent-looking head above the mountain tops, one may be sure to expect some boisterous demonstration.

The mountains proved an infinite source of pleasure, and fearful of being unable to exhaust all the enjoyment possible to a

limited stay, I found myself seizing upon every opportunity and every available point of observation for studying them. I was even discovered contemplating them from the top of a cultivator, and so absorbed as to be utterly oblivious of my grotesque appearance, or the uncomfortable insecurity of my position. I could never weary of watching that magnificent array of foot-hills bristling with jagged rocks of every conceivable shape, and presenting new aspects under each changing phase of the sky. Their ruggedness is all the more effective for the occasional glimpses of snowy peaks beyond. Instead of the pigmy affairs I had imagined them to be, I found the foot-hills to be, in some cases, elevations of from six to eight thousand feet high. People in non-mountainous regions would never dream of giving them the insignificant designation of "hills." Owing to the rare purity of the atmosphere, which causes so much deception as to distances, each feature stands out with as much distinctness as if the "hills" were but a half mile away, when, perhaps, they may be three or four miles off and several thousand feet in height. So, too, the rolling bluffs and smooth plateaux lying at their feet, which look like mere knolls, may be from forty to sixty feet high.

I was by no means slow to cultivate a more intimate acquaintance with them, and my very first visit was to Boulder Cañon, said to be one of the finest. It lies just back of Boulder, whose main street runs directly into it. Near the mouth of the cañon is a flouring mill, built and successfully operated by a lady, who, it was added, also carries on a prosperous banking business in a neighboring town. In Boulder also lives Mrs. Maxwell, of Centennial Exposition fame, and it was among the neighboring mountains that the famous animals which she afterward preserved were caught. And this suggests the idea that for "progressive women" Colorado is, perhaps, just the place—better even than Wyoming, as there is much more of it.

One has only to ride into this cañon to be convinced that it is most appropriately named. Mountains upon mountains of rocks are piled up in every conceivable shape. Huge bowlders of all dimensions hang in the most precarious positions, whole avalanches of loose stones lie in confusion on the steep declivities — rocks every-where. And while these rocky wonders are towering above, beneath rushes the Boulder Creek, filling the whole cañon with its tumultuous music.

One feels like protesting against the easy mode of getting through this cañon, where an excellent road enables one to bowl com-

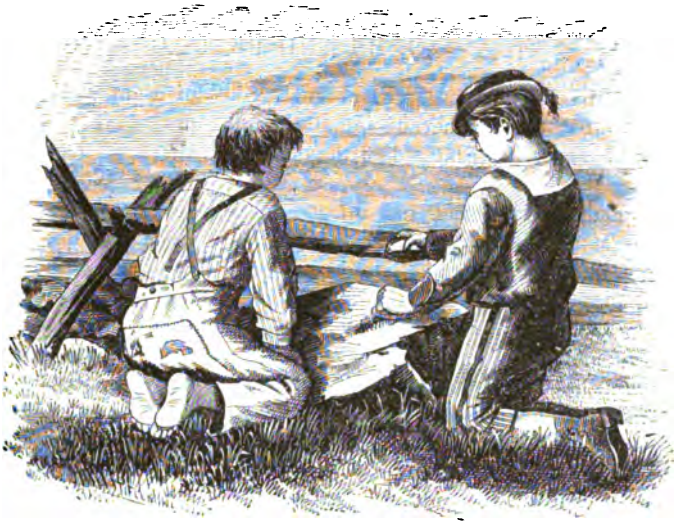
THE FOOT-HILLS, FROM AN ODD OUTLOOK.

fortably along in an easy carriage. But there is an exciting interest in the ride itself as well as in the scenery, and one can not readily get accustomed to an anxious trepidation caused by the dread of meeting other vehicles in the narrow places where the only apparent way out of the difficulty would seem to be the necessity of riding up the perpendicular cliffs, or taking a desperate plunge into the roaring waters below. There, too, is the pleasant excitement of encountering other parties of tourists with the usual craning of necks to see who can possibly have turned up in the rocky fastnesses of so remote a corner of the world.

All along the way one sees evidences of the "prospecting" that is constantly going on for the discovery of mining treasures, and it is in this region that some of the best gold and silver mines are situated. The present excitement at Leadville detracts from the mining interests of Boulder County, and it is owing to this excitement that a mine of equal value in the latter place will not sell for nearly the same amount as in the former. On a railroad trip to Denver I met an old miner going to see for himself if the extolled riches of Leadville were a reality, and triumphantly producing a remarkably rich specimen of ore from the Boulder mines expressed his incredulity at finding any more valuable product at Leadville. The desire for prospecting seems to be contagious when one sees so many signs of it, and I felt not a little inclined to jump from the carriage and take a tour among the rocks myself to see if some hidden treasures would not reveal themselves. On reaching home a diminutive heap of stones was discovered in the bottom of the carriage, smuggled there by my young hopeful, who, not long after, was discovered putting them through the crushing process in the hope of finding the precious ore, while a ragged urchin of the neighborhood looked on with absorbing interest. It was while riding in this cañon that the thought suggested itself, why not take a stage ride through the entire cañon and across the country to Black Hawk or Central City, making a return trip by rail through the famous Clear Creek Cañon? But the idea of riding through a cañon in a railway train would not do. Was there not, I queried, some neighboring cañon that was wild yet accessible, where one could rough it and do some genuine climbing? Young America of the party suggests "Bear Cañon, a place where there is a rough road, which runs up the sides of the gorges, and where one does n't like to ride." "Bear Cañon it shall be," was my mental reflection. So a few days after, we are off again for the mountains, this time not in an easy carriage, but with a lumber wagon, in which we were, indeed, truly jolted. When we had as much of that as we could endure we took to our feet, and in that way accomplished the rest of the climbing.

To me Bear Cañon seemed even finer than Boulder, for the gorges being narrower and the road running high up the sides makes it appear more picturesquely grand. A few ominous white-capped clouds showed their heads above the peaks, warning us that old Boreas would be at his playful pranks. His very first one was to seize upon me unawares, and turning my sun umbrella inside out proceeded to take unwarranted liberties with my apparel generally. After that I was more on my guard, and often found myself hugging close to the rocky wall lest he should take a sudden fancy to thrust me headlong down the precipice. His roaring among the gorges only added to the excitement, and coming in sudden spurts with long intervals of rest one could better endure him. Besides, if there was force in his touch, there was no harshness, and he was so soft and agreeable withal, that it was impossible to get out of patience with him. There were occasional openings in the rocks, through which we could look far out upon the plains, where, away in the distance, a line of cotton-wood trees marked the course of the Platte River. It was a day long to be remembered, one of the best features of which was that an amount of climbing and jolting which, in a different climate, would have proved utterly exhausting to me was unaccompanied by even a sensation of fatigue. There were many other places of interest in the neighborhood, among which

is the South Boulder Cañon, which is so narrow in places as scarcely to admit of the human body. If just one little peep, as it were, into these marvelous mountains revealed such wonders, what infinite stores of enjoyment one must find in a more extended acquaintance?



YOUTHFUL SEEKERS FOR WEALTH.

Tourists who postpone their visit to Colorado until late in the Summer make, in some respects, a grave mistake. If, however, they wish to make extensive explorations among the snowy range, the more abundant snows of the early season would probably prove an impediment. My own experience confirms me in this opinion. A second visit to that remarkable country in the month of September produced a different impression; in other words, resulted in a partial disenchantment. An exceptionally dry season, unblessed by even so much as a respectable shower, had changed the entire surface of the country to a dreary dun color, from which nearly every vestige of green had disappeared. And the dust—but, perhaps, the least said on that subject the better. To the inhabitants of Colorado this must be a sensitive point, in fact, their special *bête noire*, which no amount of philosophy on their part can suffice to enable them to bear with equanimity. But worse than all, extensive fires among the mountains caused so dense a smoke as to conceal them from sight, and dampen one's enthusiasm for exploring them. The foot-hills might have been a thousand miles away for any knowledge one could have of their near existence by personal observation. Old "Red Bank" reared his six thousand feet of rocky wildness almost over my head, and I was made conscious of his close vicinage only by the twinkling of fire lights along his front. So, what with the smoky pall on one side shutting out what I so longed to see, and the great prairie in its brown dress stretching away on the other, I was forced to conclude that Colorado in September was quite a different place from Colorado in May.

There was, however, the same agreeable air with its healthful stimulant, the same fresh but softly blowing wind, which seemed to have in its touch nothing but kindly benedictions. Gradually, too, the curtain of smoke lifted until at the time of my departure the mountains stood revealed in all their grandeur. A brilliant sunset added to them a fresh charm. Bright shafts of light penetrated their dark defiles and reaching far out upon the plains lighted up its somber expanse with such variegated hues as made it seem a picture of enchantment If this demonstration on the part of nature was for the express purpose of causing me to carry away new and awe-inspiring impressions of that wonderful region it was a *coup d'état* that was as effective as it was brilliant.

GEMS AND PRECIOUS STONES.

GEMS are always carved or engraved, after the manner of intaglios, and should never be confused with precious stones.

The diamond differs from all other precious stones in being harder than any of them, in having a greater refractive power, and in preserving its luster undiminished when immersed in alcohol or in water. In addition, if we except the garnet and spinelle, it has single refraction only, while all the others have double; that is, when a small light is viewed in their facets they reflect two images of it, the diamond, the garnet, and the spinelle reflecting but one.

This is a criterion by which we can discriminate between real and artificial stones, save in the case of the three just named; for, like them, artificial stones have but single refraction. There is, however, another manner of deciding between the true and the false in this relation, and this is found in the fact that the diamond scratches all other minerals, and, being a better conductor of heat than any artificial stone, feels colder to the tongue than the latter when both stones have acquired the same degree of temperature, at which point only this test can be safely applied.

In a paper read before the London Society of Arts, some time ago, it is set forth that a diamond, of the first water we presume, weighing one carat, or four grains, is worth $40; one of two carats, $80; of three, $360; of four, $640; of eight, $1,000; of ten, $1,500; of twenty, $16,000; of thirty, $36,000; of fifty, $100,000; of a hundred, $400,000. Taking these ratios as a basis, the Koh-i-noor, which weighed originally seven hundred and ninety-three carats, or nearly half a pound, would, had it been cut and managed honestly in the first place, have brought a fabulous sum, although a diamond of the second water only. But so barbarous the usage it had suffered, and so blood-stained the history attaching to it, we need not be surprised that from a Mountain of Light, as its name imports, it has dwindled down to a mere hillock, and that the Brahmins had attached an evil influence to it.

The Hindoos assert that this wonderful stone was discovered in the mines of Golconda upwards of three thousand years ago, and that it is, consequently, the oldest diamond in the world. There are, however, some differences of opinion as to its early history; although there is but little doubt as to its great antiquity, or its having been for ages a cause of crime and bloodshed among some of the princes of India. About two hundred years ago Tavernier, the French traveler, saw it in the East, and spoke of the admiration which it always elicited. Runjeet Sing appears to have been the last of the native potentates who had obtained possession of it; for in 1850, when the Punjaub was conquered by the British, it fell, with other spoils, into the hands of the East India Company, by whom it was presented to Her Majesty Queen Victoria, when it had already been plundered of six hundred and seven carats of its original weight.

The manner in which Runjeet Sing managed to lay his hands on it was most infamous. Having been informed that the khan of Cabul had the largest and finest diamond in the world, he treacherously invited that prince to his court, intending to plunder him of the famous stone should he bring it with him, or in the event of his leaving it behind to hold him in durance vile until he ransomed himself with it. The khan, who was in no position to refuse an invitation which was half a command, presented himself in due course, when his treacherous host at once demanded the diamond, with an intimation that a refusal would prove fatal to the guest.

Suspecting treachery, the khan, previous to his visit, had had a clever imitation of the diamond made, and this, with seeming great reluctance, he now placed in the hands of the royal robber, and returned immediately

to his own dominions. Soon, however, the cheat was discovered, upon which the intending plunderer set out with a sufficient force, and, in his rage and disappointment, attacked and ransacked the palace of the khan, in the hope of gaining possession of the real stone. In this he had nearly failed when a servant of the khan betrayed the place of its concealment, which was under a heap of ashes; and so it was borne off in triumph by the unprincipled invader.

Previous to this Nadir Shah had obtained possession of it in a manner scarcely more reputable. "He gave back," says a certain writer in *Chambers's Journal*, "the prostrate empire of India to his Tartar kinsman, and exchanged turbans with him, according to Oriental custom, in token of amity; but, unfortunately for the vassal, the Mountain of Light was in his cap, and so was gained by his suzerain."

When the stone came into the possession of the queen of England it weighed only one hundred and eighty-six carats. In 1862 it was recut, as a brilliant, at a cost of $40,000, when it was reduced to its present weight, one hundred and six and one-sixteenth carats. With modern appliances this work occupied but thirty-eight days, while the cutting of the Pitt Diamond, by the old hand process, occupied two years. It is interesting to note that the late Duke of Wellington, out of affection for his sovereign, assisted in cutting one of the facets of the Koh-i-noor before it was finally deposited among the crown jewels.

The Pitt Diamond takes its name from the grandfather of the famous Earl of Chatham, who, at the close of the seventeenth century, was appointed to the governorship of Fort St. George, Madras. This Englishman entered into commerce with some of the natives, among whom was a diamond-dealer named Jourcund. From this dealer he purchased the famous stone for $100,000. It then weighed four hundred carats, and was of the first water. On his return to Europe he was offered $400,000 for it, but refused this sum. He subsequently, at a cost of $25,000, had it cut as a brilliant, when its weight was reduced to one hundred and thirty-six and a half carats, the fragments detached in the cutting having been sold for $40,000. He at length found a purchaser for it in the Duke of Orleans, Regent of France during the minority of Louis XIV, who bought it, as an ornament for the French crown, at $650,000, when it became known as the Regency Diamond. It was worn by Louis XIV and the monarchs who succeeded him; and after the Revolution was preserved among the state jewels. The first Napoleon wore it in the hilt of his sword at the battle of Waterloo, where it was found on the field, with other personal effects of the emperor, by the Prussians, who presented it to their sovereign, in whose possession or that of his successor it still remains.

"The Sancy" is another large diamond, which ranks among the most brilliant and valuable of precious stones. It was once the property of Charles the Bold, last duke of Burgundy, who wore it in his hat at the battle of Nancy, in which he lost his life. It was found on the field by a Swiss, who sold it for a trifle to a priest. It subsequently passed into the hands of a French nobleman named De Sancy, and had remained for more than a century in the possession of his family, when one of his descendants, a captain of the Swiss guard under Henry III of France, at the instance of the king, essayed to raise a force to assist his majesty in his wars; but the king being unable to pay the soldiers, who were Swiss, he applied to De Sancy for a loan of the diamond, that he might place it in the hands of the Swiss Government, as a guarantee that the men should be paid.

The count dispatched the diamond to the king by one of his most trusty adherents; but, to the surprise and alarm of both sovereign and subject, the messenger disappeared suddenly. Although the most diligent search had been made for him without avail, the count's confidence in his fidelity remained unshaken, and he felt convinced that some sudden and fatal misfortune had overtaken him. While in this state of mind he discovered by some means that the messenger had been waylaid and murdered by a band of robbers, and that his body was concealed

in a certain forest. Thither he hastened with a number of followers, when the remains of the murdered man were discovered and the diamond restored to its owner; for, on an examination prompted by a surmise of the count, it was found that the faithful fellow had swallowed the stone to prevent it from falling into the hands of his assassins.

This diamond was subsequently purchased for the crown of England; but James the Second took it with him in his flight to France, where it had previously, as alleged, been worn by Louis XIV on his coronation. In 1835 it was purchased by a Russian nobleman for four hundred thousand dollars, this being the latest phase of its history.

There are various other diamonds of great note and value, but a detailed account of them would exceed the space allotted to this paper. Their history, however, is not more interesting than that of antique gems which present us with pictures of the usages of domestic life among the ancients, and with illustrations of the forms and construction of countless articles used in war, in religious rites, in the games of the circus and arena, in navigation and in connection with the stage. Their importance can not be overestimated in this relation, and no one seems to have been more fully impressed on this point than Rev. C. W. King, Fellow of Trinity College, Cambridge, who has written a most admirable work upon the subject—a work evincing the most profound research, and replete with the rarest information.

In discriminating between gems and precious stones, we may observe, in addition to what we have already said, that at the coronation of the present emperor of Russia, at Moscow, the Countess of Granville, wife of the English embassador, wore eighty-eight gems selected from the Devonshire collection of Greek and Roman art which transcended in beauty and value the *parure* of any lady present, although the whole court was ablaze with diamonds and pearls; for had the most costly brilliant worn by any of the Russian dames been lost, there was a possibility of replacing it, while there was no possibility of reproducing a single gem worn by the English lady.

The carnelian and the sard, a superior variety of it, are the stones most commonly used by gem engravers. The sard takes a higher polish than the common carnelian, and is finer, tougher, and more easily worked. The name is derived from Sardis, whence this variety was first imported into Greece. Chalcedony is called white carnelian. The most ancient intaglios are cut in red carnelian. Next in rank to sards come the onyx, sardonyx, nicolo, and agate. The sardonyx is a white opaque layer superimposed upon a red transparent stratum of sard. The onyx has two opaque layers of different colors, mostly in strong contrast. The agate is simply an onyx with wavy and sometimes concentric layers; and the nicolo, merely a little onyx, its name being derived from the Italian *onicolo*.

There are many varietes of the jasper, the best with a purple, and the more common with an emerald tinge. The spotted jasper or blood-stone was anciently called heliotrope or sun-turner, from the belief that if immersed in water it reflected a blood-red image of the sun. Jaspers were the favorite seal-stones of the Romans, though garnets were prized by them also. In this latter they resembled the Persians, who appear to have regarded the garnet as a royal stone, from the fact that the portraits of the Sassanidæ are found engraved upon it.

So impressed are some writers with the imperishability of gems, and amongst them Mr. King, that it is alleged that the breastplates worn by the Jewish high-priests are "still shining somewhere." These being the earliest recorded instances of the glyptic art, the probability of the existence of the whole family of ancient gems at the present day, is, of course, involved in the idea. There is nothing unreasonable in this, as no lapse of time seems to produce any sensible effect upon these relics of the past. Have we not in vitrified clay seals bearing the name of Thothmes III, who was a contemporary of Moses? And are there not in the South Kensington Museum, or in the British Museum, other well authenticated relics of the time of the great Hebrew law-giver? Nay, more, have we not the work of a prehistoric

artist on the tooth of a walrus in one of those grand European collections where we find a moose engraven with such skill and fidelity to nature, as not to be surpassed in outline by any engraver of modern times? So that when we find the softer material resisting the tooth of time for untold ages, we may well subscribe to the indestructibility of the harder.

Herodotus tells a story about an emerald signet of Polycrates, a tyrant of Samos, which is singular in the extreme if true. Polycrates, it appears, was on terms of the closest friendship with Amasis, king of Egypt; but the latter perceiving how good fortune always followed the steps of the tyrant, wrote to him warning him not to incur the displeasure of the gods, but to avert it by relinquishing that which he prized the most amongst all his valuables. Accepting the advice as good, he, after a severe struggle with himself, threw this seal into the sea at some distance from the island. Six days afterward, while still mourning its loss, he was made a present of a fish in the belly of which, to his unspeakable joy, the signet was found. He wrote to Amasis informing him of the circumstance; but instead of congratulating him, the Egyptian monarch, moved by a sentiment totally inexplicable to us moderns, instantly withdrew his friendship from him, not considering it safe to be on intimate terms with a man who was so uniformly fortunate. The tide, however, soon turned against the tyrant, for he was basely murdered by Oroetes, governor of Magnesia on the Meander, to whom he had made a visit 522 years before Christ.

And here the name of our Savior recalls another instance of a remarkable emerald intaglio—that engraved with his head by order of the Emperor Tiberius, who was desirous of possessing the portrait of so eminent a personage. Pretended copies of this gem are not uncommon, but their spurious character is apparent in the fact that the forehead of our Lord is too shelving or retreating, while the whole treatment of the subject is weak. In truth, intaglios representing any purely Christian idea are most rare among works of undoubted antiquity; and hence, from this source we can expect but little in relation to the early condition of the Church or regarding the founders of our faith.

Although the emerald and the ruby have succumbed to the glyptic art, the diamond has never been engraved, nor had it ever been cut or polished previous to the fifteenth century. The first ever subjected to either of these processes was the Sancy, which originally weighed fifty-five carats, and which was cut by Louis de Berghem, the inventor of the art, for Charles the Bold. No mineral can be hardened sufficiently to make the slightest impression upon the diamond. Hence it has to be cut and polished with portions of itself that are applied to it after the manner of emery.

If we are to place any reliance on certain historians, nature at times anticipates the skill of the engraver. The agate of King Pyrrhus is alleged to have represented naturally Apollo and the nine muses, each designated by an appropriate emblem. Among the agates of the British Museum there is one on which the head of Chaucer is represented with singular fidelity; and yet the pebble is obviously in its natural condition. These freaks of nature are not uncommon, although the imagination seems to have done a good deal for them. On the other hand, however, art endeavors to usurp the place of nature. Crystal, heated and plunged in a tincture of cochineal, becomes a ruby, and into a mixture of turnesole and saffron a sapphire. The carbuncle of ancient times, like that of to-day, was occasionally made out of the same substance, the back of the crystal having been painted the proper color, and the stone then set in a piece of jewelry. The Romans made false jaspers, but the ancient frauds in colored stones were entirely confined to the substituting of paste for the real stone. Pliny, among various fanciful methods for detecting the cheat here, mentions one which is unerring, that of applying a splinter of obsidian which will scratch the paste but not the true stone.

The Egyptian scarabæi, or beetle-stones, are amongst the earliest monuments of the engraver's art. The beetles are cut out of

basalt, carnelian, and lapis-lazuli, but are as frequently made of limestone and vitrified clay. The earliest mode of wearing them was as a necklace, strung with other beads, the engraved base of the scarab serving at the same time the purpose of a signet. In relation to the signets of the Old Testament, Mr. King is of the opinion that they were worn on the hand and never on the finger. Thus Tamar demands the seal and twisted cord—chotam and pethil—usually rendered "ring," "signet," or "bracelet." "Again Pharaoh takes the signet off his own hand and puts it on that of Joseph; thus, also, the expression, 'the signet upon my right hand;' thus, too, the young Amalekite brings to David, as the ensigns of royalty, the diadem and the bracelet taken from the corpse of Saul, apparently because the latter contained the royal signet." According to Pliny the use of finger-rings was of no very great antiquity, so that the conjecture of Mr. King is worthy the most serious attention.

It would be interesting to know the value of the terrestrial globe constructed for the shah of Persia, and the number of precious stones used in representing its mountains, rivers, lakes, seas, and continents, for the whole is one mass of rubies, emeralds, and diamonds. The crown jewels of England are, we know, valued at $15,000,000. Professor Tennant, F. G. S., in a paper read before the Middlesex Geographical Society, while referring to the state crown of her majesty, sums up the precious stones and pearls that adorn it as follows: "One large ruby, irregularly polished; one large broad-spread sapphire; sixteen sapphires; eleven emeralds; four rubies; thirteen hundred and sixty-three brilliant diamonds; twelve hundred and seventy-three rose diamonds; one hundred and forty-seven table diamonds; four drop-shaped pearls; two hundred and seventy-three pearls." Barbot estimates the total value of these stones at $600,000.

It is difficult to say which of the crowned heads of Europe is richest in private jewels, or whether the empress of Russia, the empress of Austria, the empress of Prussia, the empress of India, or Eugenie, the ex-empress of France, is wealthiest in this relation. The cabinets of all are doubtless well stored; but we incline to the belief that Eugenie and the English monarch stand at the head of the list. Of this, however, we do not feel perfectly assured, notwithstanding the fact that India has from time to time contributed largely to the casket of her Britannic majesty, while it is well known in certain quarters that all the working jewellers of Paris and eighty of those of Vienna were employed for months in cutting and re-cutting and setting and resetting the diamonds worn by the French empress when she was united in marriage to Napoleon III.

And here, as we turn from the subject for the present, we can not help reflecting that there is yet one gem, of which we have not spoken, that transcends in luster and in value any and all of those already enumerated. We shall leave its designation to the thoughtful reader, not doubting that she will turn her eyes inwardly and inquire whether she is possessed of it, and of the ineffable peace and happiness inseparable from its existence.

A WINTER IDYL.

BEYOND our birdless orchard
The dull, red gold of Winter sunset glows;
Sketched sharply o'er the splendor
Each leafless branch a softened outline shows.

This noon, in glare of sunlight,
We spoke of fruitless boughs as ugly then;
Now thought of coming darkness
Makes fair what we may never see again.

Ah! most we prize our favors
When from our grasp they have forever flown;
We grieve, at Winter twilight,
For Summer days whose joys were half-unknown.

PETRARCH.

THE recent publication of a biography of Petrarch in the series of "Foreign Classics" for English readers, has drawn attention anew to a name that has hardly died on the lips of the world in the past five hundred years. Like Dante, Petrarch was descended from an ancient Florentine family. His father, Pietro Petrarco, a respectable notary, on account of his opposition to the intervention of a foreign power in the affairs of Florence, was banished from the city at the same time that his greater countryman, Dante, experienced a similar calamity. Pietro found a refuge for himself and family in the little city of Arezzo. Here, on the night that the banished citizens of Florence made the disastrous attempt to recover their homes, July 20, 1304, Francesco Petrarco was born. Eletta, the mother, was not included in the sentence that exiled her husband, and, until Petrarch was seven years old, she resided at Ancisa, a small town about fifteen miles from Florence. At that time the family were reunited at Pisa, and four years later at Avignon, then the residence of the pope. In the little town of Carpentras, near Avignon, Francesco was sent to school. When other boys of his age were struggling to master the elementary principles of the Latin language, and wearily plodding their way through Æsop's Fables, he was reveling in the beauties of Cicero and Virgil, and that love for learning had already been kindled in his soul which was only to be extinguished with his life. As the profession of the law was then the only road to preferment outside the Church, Petrarch, at the age of fifteen, was sent to Montpellier to pursue his studies. He there showed his preference for the ancient classics over dry legal lore, and his slow advancement was long a mystery to his father. But in no way disheartened, Pietro sent him in time to the celebrated university of Bologna. While here, it is related that Petrarch's father came one day to see him, and, entering his room unexpectedly, found him poring over manuscripts of Cicero and Virgil instead of the tomes of canon and civil law. Much displeased, he seized the manuscripts and threw them into the open fire. But a deep groan from his son betrayed such pain and horror at this destruction of his beloved classics, that the good father as hastily withdrew them, only a little browner by the fiery ordeal to which they had been momentarily subjected. He bade him read them if he so desired, "but let Cicero," he said "not only amuse you, but teach you to labor and love the law."

Wishing to gratify his father, to whom he was sincerely attached, Petrarch pursued his studies diligently, and became qualified for the exercise of his profession. But he early abandoned it. "Not because the authority of the laws is irksome to me," he writes, "but because I was disgusted at the thought of having to study thoroughly that which I resolved not to turn to dishonorable, and could scarcely turn to honorable, uses." Thrown upon his own resources by the death of his father, for the small patrimony left to him and his brother was reduced to a moiety before it reached them, he decided to remain at Avignon, and take orders in the Church. The friendship of the celebrated Colonna family, formed at this time, was not only the source of some of the rare pleasures of his life, but proved of material benefit to the future poet.

The almost life-long exile of Petrarch from his native land has been considered a positive advantage to him. He remained long enough in Italy to make the beautiful language his own; but after that he was literally a wanderer, for though Avignon was nominally his home, his was an eminently changeful, restless career. But though changeful, it was not distracting, for everywhere he went he carried with him an atmosphere of learning. He attracted to himself those whose tastes and pursuits were congenial, and at no time intermitted that mental activity and devotion to intellectual

pursuits to which he had consecrated his life. To have been at that stormy period a citizen of any one of the Italian republics, states, or kingdoms would have interfered signally with his pursuits as a man of letters. Avignon was also a most fortunate retreat for the man who was to combine in himself the intellectual forces of the new epoch. His must be a comprehensive culture. No narrow provincial horizon must shut in his gaze. He must have a world-wide outlook. Avignon was the only cosmopolitan city of that age. Here was the residence of the popes. Hither came men from all parts of the world to transact the business of the Catholic Church. Petrarch mingled in a society the most varied in Europe. Its influence upon his impressible nature was most powerful.

His attitude towards the papal court was somewhat peculiar. He enjoyed the friendship of five popes, and his appointment by them to numerous small benefices secured his pecuniary independence. But he was unsparing both in his prose and in his verse in the abuse he heaped upon them. When Petrarch was twenty-three years old he met Laura, the beautiful wife of Hugo de Sade, an event which colored the whole future of his life. Early one morning, in Easter week of 1327, Petrarch entered the Church of St. Claire to take part in the customary devotions. Laura de Sade came hither for the same purpose. As the eye of the poet rested upon her exquisite form, her golden hair, her lovely face, his susceptible soul received an impression so deep and lasting that it remained forever a controlling influence of his genius and his life.

Laura de Noveo was born in Avignon in 1307, and married to Hugo de Sade in 1325. Her husband's temper, naturally morose, was not likely to be sweetened by the partiality of Petrarch for his wife. But though Laura could hardly be indifferent to the admiration of one whose praise was couched in such exquisite sonnets, there is no evidence that she ever permitted the attentions of the poet to go beyond the strictest limits of propriety. She was beautiful and she was virtuous. She was a faithful wife and became the mother of a large family. The merest trifles such as the passage of his lady's shadow, the dropping of her glove, the scent of a flower, the rustle of a laurel bush, are all that Petrarch's imagination fed upon; and it may be doubted whether he was ever honored by a nearer approach to her personal favor or even acquaintance.

"Romantic devotion to some beautiful woman," writes Petrarch's latest biographer, "was characteristic of the age of chivalry, not yet extinct. It inspired the troubadours of the twelfth and thirteenth centuries as it had fired the legendary prowess of King Arthur's knights. It mingled with the feat of arms in the tilt-yard, and with the prayers and ritual of the sanctuary. Surrounded and adorned by this atmosphere of dutiful and courteous admiration, the part of Queen of Beauty was one to which women of the purest lives might, by the custom of the age, aspire.

"In Petrarch this ideal passion took the shape not of knightly exercises, but of poetry. He was one of the men gifted with an inimitable art of expression, who can create and perpetuate by language emotions more intense and lasting than their own. Without disputing the reality of his tenderness for Laura, it is impossible not to see that it was prodigiously enhanced by the pleasure he found of transfusing it into verse. There is in the Canzoniere as much of the artist as the lover; and the sonnets which record his sufferings at a separation from an unrelenting mistress, or his matured grief over her early grave, all partake of this artificial character. This, too, was in the spirit and taste of the age. He is the lineal descendant and direct offspring of the troubadours of Languedoc and Provence and of the earlier poets of Italy.

"If the passion of Petrarch had had more sensual reality in it, it might have been less enduring. Its ideal character permitted it to survive the vicissitudes of life, the decline of beauty, the advance of age, and death itself; for it was enshrined in thought and language, over which time had no power. Laura was forty years old when she died; but her death gave a fresh theme to a dis-

consolate lover. There is no evidence that she shared his tender sentiments, but rather the reverse. He describes her as indifferent to the charms of poetry and song. A veiled figure, intent probably on other affections and cares, haunted him like a spirit; but that spirit breathed life not unmingled with suffering, into his heart, and burst forth in his verses with a splendor and warmth not his own. There is not the smallest evidence that Laura returned or requited his love. He speaks of her countenance as severe, and this stern demeanor was only relaxed by a rare passing gleam of consideration and courtesy. On earth and in life an unfathomable abyss seemed to separate him from her. He loved as one might love an angel or a star."

Petrarch had two mistresses. One was Laura de Sade. To her his sonnets, three hundred in number, were addressed. To banish the image of her loveliness, and drive away the memory of his hopeless passion, he traveled extensively for that age—now a sea voyage along the shores of Spain, France and England; again to Germany and other parts of Europe; to Italy, his beloved native land, whose wrongs excited the most stirring and impassioned of his poems; to Rome, where the antiquities and the artistic ruins of that glorious era of art and literature bearing the name of Agustus, thrilled with delight the finest fibers of his soul. But each time he returned to Avignon, vainly imagining himself master of his being, to be thrown into transports of passionate love at the sight of Laura's beautiful form. In vain he buried himself in the lonely vale of Vaucluse; its romantic solitude only made it more acceptable to his heart.

Fortunately for Petrarch and the world he had another idol, at whose shrine he bowed with as intense and pure devotion as that which he poured forth at the feet of the beautiful Laura. That idol was learning. He may be called the apostle of modern culture. It was his indefatigable search for manuscripts that saved many precious copies of the ancient classics from the ignorant vandalism of the monks, who, in many instances, erased the original text to make room for their own stupid traditions. Petrarch spared neither labor nor expense to collect these from the dungeons of monasteries where they lay exposed to filth, mold, and vermin.

It was his clarion notes that awoke the intellect of Italy from her long sleep of a thousand years, made her discontented with the corrupt Latin so long in use, and revealed the treasures that lay wrapped up in the ancient classics. He was the first to attempt the restoration of the pure diction and style of Cicero to the intellectual world. Though his Latin sentences fall gratingly on the fastidious ear of posterity, it was to his efforts and influence that scholars of succeeding ages were indebted for the culture that enabled them to see his defects.

In 1339 Barlaam, a learned Greek, came on a mission from the Greek emperor to Avignon. From him Petrarch learned the little that he ever knew of the Greek language. He won the love and lasting friendship of Barlaam by his interest in Greek philosophy and his enthusiastic admiration of Greek poetry. Love and glory were the ruling passions of Petrarch's life. The latter impelled him to covet the honor of receiving publicly the laurel crown of the poet. To gain this he courted the society of the rich and powerful, and to be worthy of it, pored over his books with the devotion of a young man striving for academic honors. At last the long-coveted distinction was granted him. August 23, 1340, as he walked in his orchard at Vaucluse, a letter was given him desiring his presence in Rome to receive from the senate the poet's crown. The same day a similar offer was brought to him from the chancellor of the university in Paris. After some deliberation he chose Rome. To assure himself and the world of his qualifications, he submitted to a public examination. For three days, at Naples, in the presence of the whole court, the erudite king Robert plied him with questions that reviewed all the learning of that age. The listeners were delighted with the ready replies of the poet, and at the conclusion he was pronounced in ever way worthy of the dignity to be conferred upon him.

"Early in the morning of Easter day, April 8, 1341," writes one of Petrarch's many biographers, "the streets of Rome resounded with trumpets and the shouts of multitudes, thronging to witness the novel sight of a poet's coronation. The favored bard, as he proceeded to the capital, was attended by eighteen young and noble Romans, twelve in scarlet robes, the rest in green. The senator and chief officers of state came next, and thus escorted he passed through the principal public avenues to the scene of his triumph. The streets had been thickly strewn with flowers, and the windows of every house were filled with ladies, who, while the songs and music of those who accompanied him made the whole scene like a magic show, flung the richest perfumes from the balconies so freely that the essences expended would have served even Spain for a year. Arrived at the capitol, Petrarch, formally summoned by a herald, briefly addressed the assembled multitude, and to their repeated cheers responded by a loud voice, *Viva lo popolo Romano.* He then knelt down, and the senator, placing a crown of laurel on his head, proclaimed him prince of poets. Rising amid the applauses of the spectators, he immediately recited a sonnet on the heroes of Rome, and was then conducted from the capitol to St. Peter's. There taking off his crown before the altar he made it an offering to heaven, and, having finished his devotions, proceeded to the palace of Stephen Colonna, where the chief personages of Rome awaited him at a sumptuous repast. After spending a few days among his friends, and receiving a diploma from the senate which designated him poet, historian, and citizen of Rome, he set out on his return."

In later years Petrarch felt the emptiness of this pompous ceremony, and realized how little real honor and dignity it conferred upon him. In one of his last letters, addressed to Boccaccio, he writes, "That laurel was obtained when I was young and inexperienced; its leaves have been bitter to me; and, with more knowledge of the world, I should not have desired it. I gathered from that wreath no fruit of knowledge or eloquence, but the keenest envy, which robbed me of repose, and made me pay dear for my fame and youthful ambition."

These two writers, Petrarch and Boccaccio, to whom Italian literature is so deeply indebted, first met at the court of Naples. Their acquaintance was renewed at Milan. The advice and expostulations of Petrarch had a marked influence upon the author of the Decameron, who had been as licentious in his life as in his productions. Petrarch gave him at parting a copy of his Latin Eclogues, and Boccaccio presented to Petrarch a copy of Dante's "Divine Comedy." This friendship, one of the most interesting in literary annals, was still further cemented by the intercourse they enjoyed in Venice, whither both had fled to avoid the plague, then desolating other parts of Italy. It was in this city that Petrarch, feeling the approaches of age, secured a safe asylum for his books. This precious collection of manuscripts, which he had spent his life in securing, was consigned to the guardianship of the Church of St. Mark. In the library of St. Mark, founded by the munificence of Petrarch and the Republic of Venice, may still be found a few of the treasures placed there five hundred years ago by this illustrious poet.

But neither Avignon, where so much of his life had been passed, and where rested the ashes of Laura, nor Florence, his native city, nor yet Venice, to whom he had given such a strong proof of his affection, nor imperial Rome, whose citizens had honored him as no poet had been honored for thirteen hundred years, was to have the pleasure of shielding the aged Petrarch in his declining years. His last retreat was Arquà, near Padua. In this sequestered and pleasant village among the Euganean hills his last literary work was done. Here he read for the first time Boccaccio's "Decameron," translated the story of "Griseldis" into Latin, and sent it with a letter to the author expressing the pleasure he had taken in reading those "matchless fictions." The day after writing this, July 18, 1874, he was found dead in his library with his head resting upon an open book.

Petrarch was the prominent literary man of the age in which he lived. His shadow extends across the fourteeth century. Through the influence of his writings, by personal friendship, by correspondence in which he gave encouragement and advice, he formed among the other scholars of Europe a bond of union hitherto unknown.

It was the glory of this man of letters, not that he wrote brilliant sonnets to the beautiful Laura, not that he indited learned Latin epistles, which could hardly reach the persons to whom they were addressed, so eager was the public to peruse them; not that he composed verses and treatises in the same language,—none of these labors entitled him to the fame that every age since his time has cheerfully awarded him. He achieved the nobler work of diffusing a love of learning throughout Europe. He so imbued the minds of scholars with enthusiasm for antiquity, both in art and literature, that when the opportunity was granted them of mastering that tongue in which all the wisdom and poetry of the Greeks are embalmed, they were prepared to profit by it, and thus usher in the glorious era of the Renaissance, of which he was the herald.

He lived, especially during his last years, among his books. Wherever he went, and his journeys were numberless, they accompanied him. His study joined his bedroom. Like a religious devotee he gave himself only the absolutely necessary morsel of time for sleep that he might have the more to devote to his darling pursuits. He secluded himself from his friends for the same purpose. He refused many lucrative offices at papal and princely courts for fear his opportunities for study and thought would be infringed upon.

"He was the first and the best of the humanists," writes Sismondi. "With all his erudition, his enthusiasm for the classics, he never forgot that Christianity was an advance on paganism. He believed that men should guide their steps by the double light of culture and conscience." "I am sometimes a peripatetic," he writes to John of Florence, "sometimes a stoic, then I am an academician, then I am neither one nor the other; but I am always a Christian. To love wisdom is to be a philosopher, but the true wisdom is Jesus Christ. Let us read historians, poets, philosophers, but let us ever treasure in our hearts the Gospel of Christ. That is the true source of wisdom and happiness."

It would have been well for those who followed him in the line of scholarship if they had been true to this faith. Noble as their work was, and deeply as modern culture is indebted to their efforts, they might have ushered in a still more glorious era by holding fast to the principles of that Christianity they affected to despise. Why did not their intellectual acumen enable them to detect the essential good as well as the temporary evils of that system, and not confound the pure teachings of Christ with the immoral practices and impure doctrines of a powerful but corrupt Church?

Arquà still cherishes memorials of Petrarch. There can be seen the house where he spent his last years, the desk on which he wrote, the chair in which he sat. Beside the rushing stream stands the coffer of Verona marble where rests his ashes. Byron thus commemorates the spot:

"There is a tomb in Arqua—reared in air,
Pillared in their sarcophagus repose
The bones of Laura's lover; here repair
Many familiar with his well-sung woes,
The pilgrims of his genius. He arose
To raise a language, and his land reclaim
From the dull yoke of her barbaric foes.
Watering the tree which bears his lady's name
With his melodious tears, he gave himself to fame."

BEYOND.

WHEN you would have sweet flowers to smell and hold
You do not seek them underneath the old
Close-knitted sod, that hides away the mold,
Where in the Spring-time past
The precious seed was cast.
Not down, but up, you turn your eager eyes;
You find in Summer the fair flowery prize
On the green stalk that reaches toward the skies,
And, bending down its top,
Gather the fragrant crop.

If you would find the gold of some pure rill,
That, following her unrestrained will,
Runs laughing down the bright slope of the hill,
Or, with a serious mien,
Walks through the valley green,
You do not seek the spot where she was born—
The cavernous mountain chamber, dim, forlorn,
That never saw the fair face of the morn,
Where she with wailing sound
First started from the ground;
But rather will you track her windings free
To where at last she rushes eagerly
Into the white arms of her love, the sea,
And hides in his embrace
The rapture on her face!

If from the branches of a neighboring tree
A bird some morn were missing suddenly,
That all the Summer sang for ecstasy,
And made your season seem
Like a melodious dream;
You would not search about the leafless dell,
In places where the nestling used to dwell,
To find the white walls of her broken shell,
Thinking your child of air,
Your winged joy, was there!
But rather, hurrying from the Autumn gale,
Your feet would follow Summer's flowery trail
To find her spicy grove, and odorous vale,
Knowing that birds and song
To pleasant climes belong.

Then wherefore, when you see a soul set free
From this poor seed of its mortality,
And know you saw not that which is to be,
Watch you about the tomb
For the immortal bloom?
Search for your flowers in the celestial grove:
Look for your precious stream of human love
In the unfathomable sea above;
Follow your missing bird
Where songs are always heard.

ROBERT HALL.

PERHAPS the most distinguished ornament of the Dissenters, in England, if not the most eloquent preacher of all classes of Christians in the latter part of the last century and the beginning of the present one was ROBERT HALL, successively pastor of the Baptist Churches at Cambridge, Leicester, and Bristol.

This extraordinary man was born at Amsby, a country village situated about eight miles from the city of Leicester, in England, on the 2d of May, 1764. His father, descended from a respectable Northumberland family, was the pastor of a Baptist Church in that village; only moderately educated, but of a correct judgment and solid piety; one of the earliest of those pastors among the Baptists who aimed to bring the Churches of that denomination from the heights of ultra-Calvinism to less extreme views of religious truth. He was the author of several publications which have been very useful in the Churches, one of which, his "Help to Zion Travelers," has gone through several editions, and is still in demand. He died in March, 1791, and his distinguished son wrote of him, "he appeared to the greatest advantage upon subjects where the faculties of most men fail; for the natural element of his mind was greatness." The wife of this excellent man, Robert Hall's mother, was "a woman of sterling sense and distinguished piety." Her death occurred in December, 1776.

The subject of this sketch was the last born, the fourteenth, child of his parents. Of these fourteen only six survived their parents, and only three lived to share in the general sorrow which the death of their youngest brother produced. His infancy was exceedingly unpromising; he was so unusually delicate and feeble that he could neither walk nor talk until he was two years old, and it was not supposed that he would reach maturity. He was carried in the open air in the arms of a nurse, a woman of integrity and intelligence, who taught him to pronounce the letters of the alphabet from the inscriptions on the grave-stones in the village grave-yard; and, after the spell had been thus broken, she led her puny scholar to group the letters thus learned into syllables and words, and eventually to read and speak.

The parents of Mr. Hall, like many other English parents of moderate circumstances, intrusted the primary school education of their child to a female teacher; "Dame Scotton" having enjoyed the honor of being his first professional instructor, and "Dame Lyley" that of being the next in the succession. While Robert was under the care of these ladies he became a collector of books and an eager student; and he was accustomed in the Summer afternoons, after school hours, to gather his little library, steal into the neighboring grave-yard—which he called his "study"—throw himself upon the grass, and, surrounded by his books, remain there engrossed in his reading until the deepening shades of evening compelled him to return to his home. It is not improbable that he contracted in that exposure the disease which so sadly embittered his entire manhood, and which led Doctor Pritchard to remark, years after, that "no man, probably, ever went through more physical suffering than Mr. Hall."

During this period Robert became intimate with one of his father's congregation, a tailor, a very well informed man, unusually shrewd, and an acute metaphysician. Through the influence of this humble mechanic the child became an earnest reader and attentive student of the works of Jonathan Edwards, whose profound treatises on the "Affections" and the "Will," before he had passed his eighth year, had been perused and reperused with intense interest. Butler's "Analogy," and other works equally profound, had also, with the help of his friends, passed under his eye, "with a like interest."

At about six years of age he was trans-

ferred to the day-school of Mr. Simmons, of Wigston, where he appears to have continued until he was eleven years of age, when his conscientious teacher informed his father that he was quite unable to keep pace with his pupil. The remarkable character of Mr. Simmons's young pupil, both intellectual and religious, induced his father to think seriously of educating him for the ministry; but the delicate health of the son and the limited means of the father occasioned some perplexity. Mr. Hall contented himself, therefore, in taking his already distinguished child to Kettering, in Northamptonshire, leaving him temporarily in the family of Mr. Beeley Wallis, an influential and valued friend; and the already impaired health of the young student appears to have been much improved by his short cessation from labor. But the brief visit to Kettering was productive of other results, not less significant than the restoration of some portion of Robert's impaired health. It appears that Mr. Wallis, whose guest he was, was so much astonished at the precocity of talent of his young visitor, that he requested the latter several times to deliver a short address to a select auditory invited for the purpose. When the promising child had become the distinguished preacher years afterwards, he referred to the injury which had been thus unwittingly inflicted on him by that injudicious proceeding. "Conceive, sir, if you can, the egregious impropriety of setting a boy of eleven to preach to a company of grave gentlemen, full half of whom wore wigs. I never call the circumstance to mind but with grief at the vanity it inspired; nor when I think of such mistakes of good men am I inclined to question the correctness of Baxter's language, strong as it is, where he says, 'Nor should men turn preachers as the Nilus breeds frogs (said Herodotus), when one-half *moveth* before the other is made, and while it is yet but *plain mud!*'"

From Northampton he appears to have returned to his father's house at Amsby; and during the succeeding two years and a half he studied divinity and some collateral subjects, principally under the guidance of his father, with occasional hints from his metaphysical friend, the village tailor. In October, 1778, being then in his fifteenth year, Robert was placed in the Bristol Institution, a theological seminary controlled by the Bristol Education Society, on a foundation created by Doctor Ward, where, during the succeeding three years, he pursued his studies with great ardor and success under Rev. Hugh Evans, Rev. Caleb Evans, D. D., and Rev. James Newton. In the Autumn of 1781, also on Doctor Ward's foundation, and in accordance with that gentleman's will, Robert accompanied by Mr. Stennett, went to Glasgow, where he appears to have entered King's College, and while there he became the companion and bosom friend of Sir James Mackintosh, the distinguished historian, statesman, and jurist, whose intimacy continued unbroken until the death of the latter in 1831.

While Mr. Hall was thus completing his collegiate education, it is said that "he set too high an estimate on merely intellectual attainments, and valued himself, not more, perhaps, than was natural to youth, yet too much, on the extent of his mental possessions," and it is not to be wondered at, therefore, nor is it to be seriously regretted, that when he made his first effort to deliver a sermon, on the text which had been assigned to him (1 Timothy iv, 10), he made an ignominious failure, and that his second effort, on the following week, on the same text, was even more disastrous.; although it is claimed by his friends that he was awakened to a sense of his undue self-esteem by these terrible failures, and that his "humility afterwards became as conspicuous as his talents."

He generally spent the seminary and college vacations under the paternal roof at Amsby, and in that of 1780,—August 13, 1780,—he was formally "set apart to public employ," by the Church of which his father was pastor, in accordance with the usage of Baptist Churches; and, in November, 1783, while he was yet pursuing his studies in Scotland, he was invited by the Broadmead Church at Bristol, to become the associate pastor with Doctor Caleb Evans, his former preceptor, an invitation which he accepted,

it is said, "with much doubt and diffidence." From the date of his acceptance of this joint pastorate until May, 1785, when he completed his studies in King's College, Mr. Hall occupied the pulpit of the Broadmead Church only during the college vacations, and just as he had attained his majority, he left Scotland and entered on that brilliant career which has made his name illustrious.

At that time Mr. Hall's mental powers, which had always been strong, seemed to have attained extraordinary vigor; and, with the exception of the Hebrew language, of which he knew nothing, his acquirements were very large in literary and Biblical knowledge. His style of preaching also was exceedingly attractive, and, notwithstanding the high standing as a scholar and preacher of his associate in the pastorate, Dr. Caleb Evans, his sermons excited an unusual attention, and the meeting-house was frequently crowded to excess, many of the most distinguished residents of Bristol, lay and clerical, being frequently among his hearers, a popularity which continued unbroken as long as he resided in that city.

The brilliancy and force of Mr. Hall's eloquence were universally recognized, and his instructive and fascinating conversation were not less generally known and admired. But it is due to truth that we shall say that it is very questionable if he possessed at that time any thing else than a merely intellectual knowledge of the great plan of redemption and of the salvation of fallen man, agreeably to that plan, through a crucified and risen Savior. Indeed, it is said of him, by one of his most intimate personal friends, that "it ought not to be concealed (for I simply announce his own deliberate conviction frequently expressed in after life) that at that time he was very inadequately qualified for the duties of a minister of the Gospel. He had, it is true, firmly embraced and cordially relied upon those fundamental truths which are comprehended in the declaration, 'He that cometh to God must believe that He *is*, and that he is the rewarder of them that diligently seek him;' and he often expatiated with much originality and beauty upon the divine attributes, and constantly exhorted men to adhere closely to the path of duty, yet not often from the higher, namely, the evangelical, motives to pure and benevolent and holy conduct. His knowledge of Christianity as a system of restoration and reconciliation was comparatively defective and obscure," his friend continued: "and he felt but little alive to those peculiarities of the new dispensation upon which in mature life he loved to dwell. In his preaching he dwelt too much in generalities or enlarged upon topics which, though in a certain sense, are noble and inspiring and thus calculated to elevate the mind, did not flow immediately from the great scheme of redemption which it was his especial office to disclose. The extent of God's matchless love and mercy, the depth of the mystery of his designs, the inexhaustible treasury of his blessings and graces, the wonderful benefits flowing from the incarnation, humiliation, and sacrifice of the Son of God, the delightful privileges of the saints—these were themes to which he recurred far less frequently than in later years; and he persuaded himself that this was not very wrong, because his colleague, Dr. Evans, who had 'the charge of the Church,' adverted so incessantly to the doctrines of our Lord's divinity and atonement, of spiritual influence and regeneration as to leave room for him to explore other regions of instruction and interest." In other words, at the time of his entrance into the pastorate of the Broadmead Church, "the root of the matter was not in him," and that, like too many pastors of later periods, he had been employed and regarded himself as employed not so much to "preach the Gospel" or to seek the salvation of sinners, as to roll out finely constructed sentences concerning every thing else than the "Master's business," for the infinitely less worthy purpose of merely delighting "the pews."

But it was not merely in his negative qualities that Mr. Hall at that early period had become an object of anxiety among the leading pastors throughout the kingdom. As early as June, 1785, the not very rigid Andrew Fuller "felt much pain for him,"

because of the questionable character of his religious opinions, and prayed: "The Lord in mercy to him and his Churches in this country keep him in the path of truth and righteousness;" and about the same time Dr. Ryland, his old teacher, said that he found "many things that make me fear for him," and prayed, "Oh, that the Lord would keep him humble and make him prudent." A year later, June, 1786, Dr. Ryland was constrained to tell him "of the general disgust you have given to your former friends at Birmingham on your last visit," at the same time pointing out to him the danger of his continued dalliance with Socinianism, with which his conversation and many of his public discourses were thoroughly surcharged. Referring to one of those discourses the anxious Ryland said, "O my dear friend, can I conceive that your mind was deeply impressed with a sense of the divine purity and the justice of God's law when you could utter so vain and so vile a speech as this?"

It was hardly to be expected that so staid a senior pastor as Dr. Evans would rest contented with such a colleague or so well settled a Church as the old Broadmead with such a junior pastor. For more than two years the minds and tempers of the two pastors were much disturbed by personal differences, the partisan feelings of their respective friends were very much excited and the peace of the Church was imperiled. Papers were written and pamphlets published, the interposition of friends availed but little and an arbitration in which the mayor of Bristol represented the senior pastor ended only in increased ill-feeling. At the same time, because of Mr. Hall's continued serious defection "from the accredited standards of even moderate orthodoxy," he had not only severely wounded many of his warmest friends, and the Church of which he was a pastor was constrained soon after to take official action on the subject, apparently after some less decisive measures had proved to be insufficient, causing him to seek employment in another pulpit.

Fortunately we are not obliged to speculate concerning Mr. Hall's religious opinions at the time of which we write, since a reply which he made to the Broadmead Church in December, 1790, tells us over his own hand, that although he conceded that the Savior was divine, that his merits are the *sole* ground of acceptance in the sight of God, and that divine influence is necessary to regenerate and sanctify the mind of every one in order to his becoming a real Christian, he expressly denied "the federal headship of Adam, as it is called, and the imputation of his sin to his posterity," and all that depends on that fundamental article of faith. He professed to "believe in the divine decrees and, of course, in the predestination of all events, of which the number of the finally saved is one;" but he repudiated "the doctrine of absolute election and reprobation." He declared without reserve that he was and had been "for a long time a materialist," though he had never promulgated his views on that subject from the pulpit, and while he insisted that "the primitive, the regular, and proper mode of administration of baptism was by immersion," he also held "that sprinkling, though an innovation, does not deprive baptism of its essential validity so as to put the person that has been sprinkled in adult age upon the footing of the unbaptized." He rejected the baptism of infants, "as a perversion of the intention of the sacred institution," as inconsistently, it seems to us, as he rejected some others of the articles of the popular faith.

This strange mixture of orthodoxy and heterodoxy of immersionist and non-immersionist views which Mr. Hall thus presented as his well settled religious faith, as he well enough knew, was so questionable in its character that if no Baptist Church could be found to wink at it, "it amounted," as he himself said, "to his exclusion as a minister from every Christian society throughout the whole earth;" and thus self-sentenced this brilliant young man, whose usefulness in his designated work, if his efforts had been well directed, was limited only by his capability to labor, was obliged to withdraw from the honorable position which he then occupied, and to remain unemployed and excluded from every pulpit "throughout the

whole earth," unless some Baptist Church very loose in its creed could be induced to close its eyes to his errors and inconsistencies, and for the sake of securing a merely attractive pastor regardless of all else than his great abilities and his elecutionary and rhetorical graces, to give him the employment which he sought.

Fortunately for Mr. Hall (God only knows how fortunate or unfortunate it was for all else) there was one and only one Baptist Church then in existence which exactly met his case; and that Church strangely enough had been deprived of its gifted but erratic pastor a few months before, and at this very time was looking about for a successor. Naturally enough the admirers and supporters of Robert Robinson, the associate and apologist of Joseph Priestley, turned to Robert Hall, whose sympathy with that eminent scholar and brilliant skeptic was not less marked and but little less known, to fill the pulpit which the recent death of their favorite had left vacant at Cambridge, and quite as reasonably, even if there had been other places accessible to him, Robert Hall was not loath to occupy that particular pulpit.

The high reputation which Mr. Hall had acquired as a preacher and his openly declared materialistic opinions induced that remarkable Church in the early Summer of 1790 to invite him to occupy its pulpit for one month "as a probationer," and in December of the same year he was invited to occupy the pulpit again, also "as a probationer," for a further term of six months, and in July, 1791, at the close of his second probationary service, he was called to the pastorate.

There was not then among the English Baptists any one of sufficient eminence except Mr. Hall to have been regarded for a moment as a fit successor to Mr. Robinson, nor was there any Baptist Church in all England with which he could have then become connected, with the same prospect of becoming useful and happy with the views he then entertained. Had his religious principles and feelings been such in 1790 and 1791 as they became a few years afterward, not even his great ability would have made them palatable to such a Church, and a connection with such a one, had it been formed, would have been of short duration. On the other hand, had the Church been entirely and decidedly Socinianized, he could not have conscientiously become its pastor. The providential correlation soon began to show itself. The looseness of opinions on many points in the Church, which even then he thought momentous, led him to enforce them frequently with the utmost energy, while his known freedom of opinion on other points, which they also had been led to canvass freely, preserved him from the odium of orthodoxy. Priding themselves on their liberality and freedom, they could not but congratulate one another that their new pastor, a man of splendid talents, was almost as liberal and unshackled as they were. Again, the want of devotional seriousness in the Church and congregation, by the force of contrast, heightened his own estimate of the value of true piety, and this also produced in him an augmented earnestness and fidelity, which they learned first to tolerate and then to admire. Thus, as has been said, "by the operation of an incessant action and reaction, continued for years, each party exerted a salutary influence on the other, and at length both Church and pastor became so distinguished for piety, harmony, and affection that they who had known and lamented their former state were compelled to exclaim, 'This hath God wrought!'" It is said, however, that Mr. Hall was not quite satisfactory to all the members of the Church, and a body of them withdrew soon after he entered on the pastorate, and organized an avowed Socinian Church.

The death of Mr. Hall's father, in March, 1791, led the pastor at Cambridge to review some of his extraordinary conclusions, and it is said that gradually "some important changes in his sentiments resulted from an inquiry conducted under such solemn impressions, and among these may be mentioned his renunciation of materialism, which he often declared he 'buried in his father's grave.'"

Mr. Hall filled the pulpit of the Baptist

Church in Cambridge from June 1790, until March, 1806. He was then in the very prime of life, unmarried, surrounded by learning, wealth, and influence, and in the height of his extraordinary powers.

Dr. Olinthus Gregory, who knew him intimately all this time, writes, "When I saw Mr. Hall, I was struck with his well-proportioned, athletic figure, the unassuming dignity of his deportment, the winning frankness which marked all he uttered, and the peculiarities of the most speaking countenance I had ever contemplated, animated by eyes radiating with the brilliancy imparted to them by benevolence, wit, and intellectual energy. . . .

"Mr. Hall had a buoyancy and playfulness when among his select friends which were remarkably captivating. Among strangers there was a reserve for a short time; but it was soon shaken off, especially if he found that they were pious or intelligent. The presence of a man who gave himself airs of condescension usually induced him to remain silent or to retire. He could enjoy the society of men of moderate information, and it was interesting to observe how, by a few apt questions, he would ascertain in what direction their pursuits lay, and then so draw them out as to give them the pleasure of feeling that they were contributing to *his* stock of the knowledge which they could not but think useful. He was eminently alive to the emotions of pity, an affection always calculated to inspire attachment, but which in a man of abstract habits is apt to be unusual. He was generous by nature as well as upon principle, and in seasons of affliction would remarkably identify himself with those who most needed sympathy."

In him there was nothing whatever of gloom or moroseness, and the raillery in which he was apt to indulge showed his good nature and was exceedingly playful. In disputation he was very impetuous, often dogmatic, sometimes extremely overbearing, and conceit engrafted on ignorance especially provoked his impatience and called forth a severity which he scarcely knew how to restrain. The predominant features of his character were cheerfulness and kindness. He never deliberately gave pain to any one, except in those few instances where he felt constrained to "rebuke sharply" for the good of the offender. His kindness to children, to servants, to the poor, even to animals, was uniformly manifest; and such was his prevailing cheerfulness that he seemed to move and breathe in an atmosphere of hilarity, which his countenance always indicated, except when his bodily sufferings affected his spirits.

His pastoral duties were carefully and systematically discharged. He made it a rule to pay a pastoral visit to *every member* of his Church once in every three months, and he did the same to such of his ordinary hearers, not members of the Church, as he thought willing to receive him in his pastoral character. These were not merely calls, but visits, usually during the evening, that he might meet the entire family assembled around the family fireside. Among the poorer members, to make them feel at ease, he would sit down with them at supper, and that his visit might involve them in no extra expense he took care that they should all know that he preferred a bowl of milk. He persuaded the poorer members to form little meetings for reading, religious conversation, and prayer, going "from house to house." These were held every two weeks during the Summer and every week during the Winter, and he made it a point of official duty to attend them as frequently as possible.

Of Mr. Hall as a preacher at the time of which we write the pen of one who was then an intimately personal friend, Dr. Gregory, has left what is said to be an insufficient record, but still such a one as could be made of few others.

"His manner of reading the Scriptures at the beginning of the service was not generally interesting, nor did the portion read always bear an obvious reference to the text or subject afterward brought forward. But when passages of Scripture were quoted in the sermon they were so delivered as to give to their true meaning the most intelligible prominence and force.

"His prayers were remarkable for their

simplicity and their devotional feeling. No person could listen to them without being persuaded that he who uttered them was really engaged in prayer, was holding communion with his God and Father in Jesus Christ. His tones and his countenance throughout these exercises were those of one most deeply imbued with a sense of his own unworthiness, and throwing himself at the feet of the Great Eternal, conscious that he could present no claim for a single blessing but the blood of atonement, yet animated with the cheering hope that the voice of that blood would prevail. The structure of these prayers never indicated any preconceived plan. They were the genuine effusions of a truly devotional spirit, animated by a vivid recollection of what, in his own state, in that of the congregation, or the town or the vicinity, needed most ardently to be laid before the Father of Mercies. Thus they were remarkably comprehensive and furnished a far greater variety on the successive occasions of public worship than those of any other minister whom I have ever known. The portions which were devoted to intercession operated most happily in drawing the affections of his people toward himself, since they showed how completely his Christian sympathy had prepared him to make their respective cases his own.

"The commencement of his sermons did not excite much expectation in strangers, except they were such as recollected how the mental agitation produced by diffidence characterized the first sentences of some of the orators of antiquity. He began with hesitation and often in a very low and feeble tone, coughing frequently, as though he were oppressed by asthmatic obstructions. As he proceeded his manner became easy, graceful, and at length highly impassioned; his voice, also, acquired more flexibility, body, and sweetness; and in all his happier and more successful efforts, it swelled into a stream of the most touching and impressive melody. The further he advanced the more spontaneous, natural, and free from labor seemed the progression of thought. He announced the results of the most extensive reading, of the most patient investigation, or of the profoundest thinking with such unassuming simplicity, yet set them in such a position of obvious and lucid reality, that the auditors wondered how things so simple and manifest should have escaped them. Throughout his sermons he kept his subject thoroughly in view, and so incessantly brought forward new arguments or new illustrations to confirm or strengthen it that with him amplification was almost invariably accumulative in its tendency. One thought was succeeded by another, and that by another and another, each more weighty than the preceding, each more calculated to deepen and render permanent the ultimate impression. He could at pleasure adopt the unadorned, the ornamental, or the energetic, and, indeed, combine them in every diversity of modulation. In his higher flights, what he said of Burke might, with the slightest deduction, be applied to himself, 'that his imperial fancy laid all nature under tribute, and collected riches from every scene of the creation and every work of art;' and at the same time that could be affirmed of Mr. Hall which could not be affirmed of Mr. Burke, that he never fatigued and oppressed by gaudy and superfluous imagery. Whenever the subject obviously justified it, he would yield the reins to an eloquence more diffusive and magnificent than the ordinary course of pulpit instruction seemed to require; yet so exquisite was his perception of beauty and so sound his judgment, that not the coldest taste, provided it were real taste, could ever wish an image omitted which Mr. Hall had introduced. His inexhaustible variety augmented the general effect. The same images, the same illustrations scarcely ever recurred. So ample were his stores that repetition of every kind was usually avoided; while in his illustrations he would connect and contrast what was disjointed and opposed or distinctly unfold what was abstracted or obscure in such terms as were generally intelligible, not only to the well informed but to the meanest capacity. As he advanced to his practical applications all his mental powers were shown in the most palpable

but finely balanced exercise. His mind would, if I may so speak, collect itself and come forth with a luminous activity, proving as he advanced how vast and, in some important senses, how next to irresistible those powers were. In such seasons his preaching communicated universal animation; his congregation would seem to partake of his spirit, to think and feel as he did to be fully influenced by the presence of the objects which he had placed before them, fully actuated by the motives which he had enforced with energy and pathos. All was doubtless heightened by his singular rapidity of utterance; by the rhythmical structure of his sentences, calculated at once for the transmission of the most momentous truths, for the powers of his voice, and for the convenience of breathing freely at measured intervals; and more than all, by the unequivocal earnestness and sincerity which pervaded the whole, and by the eloquence of his most speaking countenance and penetrating eye. In his sublime strains not only was every faculty of the soul enkindled and in entire operation, but his very features seemed fully to sympathize with the spirit, and to give out, nay, to *throw* out, thought and sentiment and feeling."

During his residence at Cambridge Mr. Hall became thoroughly proficient in Hebrew, and also reviewed his Latin and Greek, and still, which is more remarkable, enlarged his knowledge of mathematics; he carefully studied the early Christian fathers, the fathers of the Reformation, the principal theologians of the seventeenth century, and the most valued authors on the same subject, including the most esteemed French writers of a later period. At the same time his usefulness and popularity as a preacher continued; the Church and congregation became larger; and in 1798 it became necessary to enlarge the meeting-house in order to accommodate the increased attendance.

During all that period the severe pains in his back, which had always severely afflicted him, became more and more oppressive, and in 1799 he was visited with a severe fever, which brought him in his own apprehension and that of his friends to the brink of the grave. But these distressing drawbacks were not sufficient to overcome his eagerness to acquire increased knowledge nor to check the intense application which was necessary to obtain it.

The change in his religious opinions which dated from the death of his father, in 1791, was evidently advanced during and subsequent to his last-named sickness. He had enjoyed "an opportunity of experiencing the support yielded by the doctrines of the cross in the near views of death and judgment." He said he had never before felt his mind so calm and happy. The impression was not only immediately consolatory, but it continued; and he was prompted to a further investigation of his peculiar opinions on one or two points of faith. It is said that for some years previous to that sickness he had earnestly and steadily enforced the necessity of divine influence in the transformation of character and in perseverance in a course of consistent and holy obedience; yet he had spoken of it as "the influence of the Spirit of God." He had done so in his letter to the Broadmead Church in 1790, but never named in express terms "the influence of the Holy Spirit." The reason was that, although he had been entirely convinced, even from the beginning, that divine influence was necessary in commencing and continuing the spiritual life, he doubted the distinct personality of the Holy Spirit. But during that sickness he perceived that whenever, in private prayer, he was in the most deeply devotional frame of mind—"most overwhelmed with the sense that he was nothing, and God was all in all"—he always felt inclined to adopt a trinitarian doxology. That circumstance, often repeated and more frequently considered in a tone of honest and earnest inquiry, resulted at length in a persuasion that the Holy Spirit is really and truly God, and not an emanation. It was not, however, until 1800 that he publicly included the personality of the Holy Spirit in his statements of the doctrine of spiritual influence.

The influence of the French Revolution in the dissemination of irreligious sentiments induced Mr. Hall to resist the evil

both in his private intercourse and his public ministrations; and in November, 1799, he preached his celebrated discourse on *Modern Infidelity*, which was so well received, unless by those whom it opposed, that "from that time Mr. Hall's reputation was placed upon an eminence which it will probably retain as long as purity and elevation of style, deeply philosophical views of the springs and motives of action, and correct theological sentiments are duly appreciated in the world." It secured for him the esteem of many distinguished men in every walk of life. And it is supposed to have done more to check the growing skepticism of that period than any other publication.

In June, 1802, when a national thanksgiving for the establishment of the general peace was held, Mr. Hall delivered his discourse entitled "Reflections on War," and in October, 1803, when the peace was broken and Bonaparte threatened an invasion of England, his reputation was raised to its greatest height among all classes by the production of his fast-day sermon entitled "The Sentiments Proper to the Present Crisis." The last ten pages of that address were thought by many, of whom Mr. Pitt was said to have been one, to be "fully equal in genuine eloquence to any passage of the same length that can be selected from either ancient or modern orators." They were reprinted over and over again and widely circulated, and they evidently suggested some of the finest thoughts in Sir James Mackintosh's splendid defense of Peltier, the editor of *L' Ambigu*, who was tried in London for a libel on Bonaparte.

Early in 1803 his bodily sufferings became so intense and unremitting that he was unable to sleep, and his spirits were consequently depressed to an unusual degree. To remedy this he was advised to remove his residence to a distance from Cambridge, and to resort to horseback exercise; and in accordance with that advice he hired a house at Shelford, five miles distant. The short and frequent journeys on horseback for a while seemed to be useful; but the improvement was only temporary. He missed the society to which he had been accustomed, and he was left too much alone and exposed to all the morbid influences of a disordered body and of an over-strained mind. The remedy for that loneliness, which he naturally sought, was that which might have been foreseen—he threw himself into the society of his books, and reasonably enough the delicate mind lost its equilibrium, and in November, 1804, he who had been so long the theme of universal admiration became the subject of an equally widespread sympathy. The skillful treatment of Dr. Arnold, of Leicester, with the blessing of God, restored the invalid to both mental and bodily health in about two months, but he did not resume his ministerial duties until April, 1805.

On his return from Leicester it was considered inexpedient for him to go to Shelford, where he had resided before he had been overcome with disease; but unaccountably to us another country home was provided for him at Foulmire, nine miles from Cambridge, where his opportunities for social intercourse were almost entirely cut off, leaving him more than ever before to feed upon his own thoughts. The consequence may be easily seen. His public ministrations presented no evidence of his wavering health; but solitude and a return of his old pain, the latter with more than its usual severity, before long began to produce their necessary consequences. In the Autumn of 1805 the malady returned, and he was again laid aside from his official duties.

Although the term of his retirement was not considerable, it was regarded as essential to the permanent possession of his mental health and vigor that he should resign the pastorate of the Church at Cambridge, and, for at least a year, he should seek retirement in a spot selected and cordially approved by himself, and entirely abstain from preaching, and that as far as possible he should avoid all strong excitement. Accordingly on the 4th of March, 1806, he resigned his pastorate, and thus terminated a connection which had continued fifteen years and been useful to both pastor and Church in the almost entire transformation of character of both.

On his removal from the care of Dr. Cox, of Fish-ponds, near Bristol, who had had charge of him during his second mental attack, Mr. Hall spent some months among his relatives and friends in Leicestershire, and by the united influences of calm retirement and gentle, spontaneous occupation he gradually regained his bodily health with great mental tranquillity and a renewed capacity for usefulness in the ministry. He occasionally preached in the villages contiguous to Leicester, and as his health improved he sometimes occupied the pulpit of a small Baptist Church meeting in Harvey-lane, Leicester, which some time previously had been under the pastoral care of that eminent man, William Carey, subsequently immortalized as the pioneer of modern missionary enterprise and as the translator of the Scriptures into the leading languages of India.

It is worthy of especial notice that notwithstanding all his remarkable intellectual powers and his unequaled reputation as a minister of the Gospel until after his restoration from these alarming attacks, Mr. Hall said of his religious experience, "his own decided persuasion was, that however vivid his convictions of religious truth and of the necessity of a consistent course of evangelical obedience had been, and however correct his doctrinal sentiments during the last four or five years, yet that he did not undergo a thorough transformation of character, a complete renewal of his heart and affections, until the first of these seizures." Some of his Cambridge friends who visited him at Shelford previous to his removal to Dr. Arnold's, and witnessed his deep prostration of soul while he read the fifty-first Psalm, and made each verse the subject of penitent confession and of a distinct prayer, were inclined to concur with him as to the correctness of the opinion. However this may be, there can be no question that from this period he seemed to live under the prevailing recollection of his entire dependence upon God, that his habits were more devotional than they had ever been before, and his exercises more fervent and more elevated.

It was also at that time that Mr. Hall, under the persuasion to which reference has been made, made a solemn dedication of himself to God, and as solemnly he appeared to have renewed the act of dedication annually on the recurrence of his birthday. One of these acts of dedication formally executed has been preserved by his faithful friend and biographer, Dr. Gregory, and for depth of penitence and pathos it has few equals, even among the writings of the mystics.

During the year 1807 his health had been so far restored that he was able to resume his pastoral duties, when he accepted the pastorate of the little Baptist Church at Leicester, which he described as "a simple-hearted, affectionate, praying people, to whom I preach with more pleasure than to the more refined audience at Cambridge." In March, 1808, he married, of which event writing to Dr. Ryland soon afterwards he said, "in gratitude to God and to my dear companion I must add that marriage has added a little to my cares, much to my comfort, and that I am indulged with the best of wives." Five children—two sons and three daughters—were the fruits of that happy marriage.

For nearly twenty years Mr. Hall continued to be the faithful and honored pastor of the Church at Leicester, and there is reason to suppose that during that period of his life, not less than in any other, he was happy, active, and useful. His Church and congregation were largely increased in numbers; his domestic comfort contributed to a more uniform flow of spirits than he had previously experienced, and even still more to the regularity of his habits; and he was, also, within reach of those social privileges which he had found so agreeable and so necessary years before.

During that period his pen was not very active, but his "Review of Zeal without Innovation," his sermons on "The Advantages of Knowledge to the Lower Classes," "The Discouragements and Supports of the Christian Ministry," "The Character of the Christian Missionary," and "The Death of the Princess Charlotte of Wales," his "Letters to the Churches," written for different associations, and his biographical sketches

are among the well-known productions of his mind. It was at Leicester also that he delivered his celebrated lectures on Socinianism, and there, too, he wrote his not less celebrated tracts on "The Terms of Communion."

Throughout the entire period of his residence at Leicester Mr. Hall suffered much from his constitutional complaint, and neither his habit of smoking nor the use of laudanum, of which, in 1812, he used from fifty to a hundred drops every night, and in 1825 not less than a thousand, seemed to alleviate his sufferings. It was truly surprising that such constant and severe pain and the means employed to mitigate it did not diminish his mental energy. A little difference was discernible in his conversation, it is said, but his ministrations in the pulpit lost nothing of their force.

In 1825 the death of Dr. Ryland led to the invitation of Mr. Hall to take the pastoral office over the Churches at Broadmead in the city of Bristol, those of which he had been previously a joint pastor, and, after some months spent in anxious deliberations, he accepted it and returned to that city.

There was no peculiarly notable event during the remainder of Mr. Hall's life. He continued to discharge the duties of his very peculiar pastorate, that of two distinct Churches, holding distinct if not antagonistic doctrines, worshiping under the same roof at the same time and under the same pastor; but it was not long after his removal to Bristol that it became very evident that his great work was nearly finished, that he was rapidly approaching the end of his days. The Church and congregation soon received numerous accessions, and their pastor received from them daily every démonstration of respect and affection. He was also favored with all those social privileges which he so greatly enjoyed, and his domestic comforts were all that he needed or desired. But for many years he had not been able to pass an entire night in his bed, and sometimes the laudanum which he took, large as the doses had become, did not sufficiently neutralize his pain to permit him to rest quietly either upon his usual three chairs or on the floor, on which he finally sought relief.

His inability to take exercise on account of the severity of his complaint produced another disorder, formidable in its nature and fatal in its result. The indications of a plethoric habit became more and more apparent, and consequently the natural action of the heart was impaired, producing a sensation of distress in the region of the chest. The most eminent physicians whose advice was sought failed to afford any relief, and during the Summer of 1830 the diseases had so greatly increased their hold on his system that he was recommended to suspend his pastoral duties and try the effect of a total change of air and scenery. He spent some time, therefore, in the Forest of Dean and at Cheltenham; but the relief which he obtained was only of short duration, the spasmodic affection of the chest occurring with increasing frequency and in a more alarming character.

The last service at Broadmead in which Mr. Hall took any part was the Church meeting held on Wednesday the 9th of February, 1831, at which his closing prayer is said to have been "most spiritual and elevated, exhibiting in its highest manifestation the peculiar union of humility, benevolence, and fervor by which his devotional exercises had very long been characterized."

On the next day, while he was in his study preparing for the usual monthly sermon preparatory to the administration of the Lord's-supper on the next Lord's-day, he was seized with an attack of the complaint in his chest, and so uncommonly severe was it, that he was compelled to multiply his doses of laudanum until during a single night "he had taken no less than one hundred and twenty-five grains of solid opium, equal to three thousand drops or four ounces of laudanum."

From that time the paroxysms increased, both in frequency and severity, and during the intervals he was usually so exhausted and weak that he was seldom able to converse with those about him. His expressions, however, "insulated and broken as they generally were, proved that he was able fully

to trust in God, which is the grand principle of religion, and that, thus trusting in Him his soul was kept in peace. No murmuring, no language of irritability escaped his lips."

He continued thus to sustain attack after attack until the 21st of February, when he was suddenly seized with one which was the last. He died surrounded by his family, and, as his medical attendants declared, "without any failure of his mental vigor or composure."

It would be as presumptuous as it is unnecessary to say any thing further concerning the literary, intellectual, or religious character of this extraordinary man. His works which remain "constitute his noblest monument, the most enduring tribute to his memory."

CONTEMPORARY LIFE AND THOUGHT IN TURKEY.

[Though written three or four months ago, the following sketches are very nearly as correct for the present time as for that for which they were written.—Ed. N. R.]

WERE it not for the suffering people we might treat of the history of the Turkish Government during these months as so many acts in a comedy; but human suffering is never ridiculous, and those who live in the midst of it find nothing amusing in the obstinate stupidity which causes it. It is not pleasant to live among the ruins of a crumbling empire, however picturesque these ruins may appear at a distance, and however much it may be for the interest of foreign politicians to leave them undisturbed. Whatever may be the course of contemporary thought in England, where the fate of Turkey has unfortunately become a party question, the people of Turkey can only think of it as it affects their own interests, and they desire above all things that the people of England should understand their condition as it is. This is a reasonable desire, whether any thing can be done for them or not.

THE GREEK QUESTION.

The Greek Question is not a simple one. Very few questions connected with the East are simple. The aspirations of the kingdom of Greece are natural. Her appeal to Europe was justifiable, and there can be no question of the advantage which it would be to Greece, and to the populations of Epirus, Thessaly, and Crete, if these provinces were annexed to the kingdom. If this were all, they would be annexed, and all the world would rejoice. It is to be regretted that the Congress of Berlin did not shut its eyes to other considerations and settle it off-hand in this way; but they did not, and no power now exists which can do so.

These provinces belong to Turkey, and she can not see that it is for her interest to give them up. Greece can not possibly offer her any thing in return for them, and, as against Turkey, she has no claim upon them. The Congress of Berlin advised Turkey to arrange by friendly negotiation for the cession of a part of them; but there is really no ground upon which a negotiation can be based. Turkey is ready to yield something out of respect to Europe; but she naturally wishes to give up as little as possible. Then there are other powers interested. Austria and Italy, but especially the former, have their own views of the destiny of European Turkey, and their own plans of aggrandizement. Albania and Macedonia have to be considered. England, France, and Russia also are looking forward to the future, and questioning how the settlement of this question will affect their plans for the final solution of the Eastern Question. Here is room for intrigues without end and complications without limit.

The Greeks are indignant, especially against England and Austria; and their papers have used some very disagreeable language. Some of them seem to believe that Osman Pasha really contemplates a reconquest of Greece itself, and that England might consent to it. All this is absurd;

but there can be no doubt about the fact that England and Austria have thus far opposed the claims of Greece, and that Austria and Turkey have, each in her own way, contributed to excite discontent in Albania, and keep up a state of anarchy in Macedonia. A leading paper in Vienna openly declared that it was the intention of Austria to push on to Salonica, after taking possession of Novi Bazaar. She certainly has very little sympathy with Greece, and if this question is to be settled at all she will keep the Greeks as far from Salonica as possible.

If the Greeks are ready to give up Janina, a settlement is possible—in spite of the Albanians. The impression is that they will not fight, although the Greeks in Thessaly and Epirus have roused their hostility, and have failed to do any thing to conciliate them in past years. They have an honest fear of being Hellenized by force, and although they have little sympathy for the Turkish Government, and are constantly quarreling among themselves, they still have a strong national pride, and they may take up arms in good earnest. If they do, it will be a serious matter for Greece.

THE PRINCIPALITY OF BULGARIA.

Bulgaria is enjoying a brief period of comparative repose. The Russians have left the country. The prince has assumed the reins of government. The people are busy with their harvest, and, except in certain districts where the disbanded soldiers of the Turkish army have taken to brigandage, there is peace and quiet every-where, and there is no reason to fear any thing more disquieting than the excitement of a general election.

The principality has a great advantage over Eastern Roumelia in that it has secured its independence, and can work out its destiny by itself, without any interference on the part of the Turks or of a European commission; but both prince and people are without experience, and there are no popular leaders who have any practical knowledge of government. The people are jealous of their newly acquired rights, and naturally opinionated and disputatious. The coming elections will no doubt cause great political excitement, and the new assembly will not be very easily managed, or be likely to win the admiration of Europe by its wisdom. It should be remembered, however, that this lack of experience is the misfortune and not the fault of the Bulgarians, and that Europe has not dealt with them in a way to win their confidence and command their respect. It has left them with a grievance which they can never forget for a moment, which must influence all their political action, and which forces them to maintain intimate relations with Russia, which is not a country where they can learn political wisdom, although it has given them a constitution which is a model of liberality. There was nothing in the Russian administration of the province which was adapted to prepare them for such a constitution, or teach them how to conduct a free and liberal government. Prince and people have to begin every thing for themselves. Indeed, they are probably worse off than they would have been if there had been no civil administration attempted in the province by the Russians. An army of occupation of any country is unfitted for the organization of civil government. This was attempted on a grand scale in the Southern States of America after the civil war, and under exceptionally favorably circumstances; but all these civil governments, established and fostered by military force, were unsatisfactory while they continued, and disappeared when the army was withdrawn. If this was a work which could not be accomplished by the United States, and by an army which was made up chiefly of civilians, it is not strange that, with all possible goodwill, the czar of Russia failed to establish a satisfactory civil administration in Bulgaria. He gave them as good a prince as was to be found in the German market, and as liberal a constitution as any in Europe. He maintained order and protected all classes as long as his soldiers remained in the country. But the whole administration was necessarily Russian in its spirit and methods, and altogether unlike what it ought to be under the new constitution.

The Bulgarians who were trained under it will have to unlearn much that they have learned, and begin anew, or they will fail to satisfy the people. All this is the misfortune rather than the fault of the nation, and it has a right to expect that Europe will be patient and friendly while it gains by experience the wisdom which no nation has ever acquired in any other way.

Prince Alexander is young, and as inexperienced as his people; but those who know him best have confidence in his good sense, and he is said to be not unlike the late Prince Albert in character. He will need all his good qualities to attain success; and if successful, he will certainly deserve to be ranked with the Prince Consort and King Leopold. His work certainly involves more self-denial than either of theirs, and not less tact and good sense. He was no doubt elected through the influence of Russia; but he is no mere creature of the czar, and has no desire to act as a Russian agent. On the contrary, he is heartily in sympathy with the liberal ideas of the West, and anxious to secure the goodwill of England. Thanks to the efforts of Mr. Palgrave, the English consul-general, this does not seem to the Bulgarians so hopeless a task as it once did.

The prince was received by his people with the greatest enthusiasm. No sovereign was ever more heartily welcomed, and each stage of his journey was a new triumph. He probably appreciated this all the more from the fact that his visit to Constantinople was made as disagreeable as possible. He was first refused permission to come at all, on the pretense that his life would be in danger. This plea was too absurd to deceive any one; but it might have caused serious difficulty if he had not appealed to the Great Powers, and at the same time manifested a disposition to conciliate the Porte by proposing to limit his stay at Constantinople to a visit of a few hours. He arrived in the Bosphorus in the morning and left in the afternoon. He was received by the sultan, but was told that, owing to the pressure of business, his firman was not ready, and could not be delivered to him. No Bulgarian was allowed to approach him, and no boat allowed to go out to his steamer. Large bodies of troops were stationed along his route and about the Russian embassy, and he was treated very much like a prisoner of state. It is not easy to understand why this farce was played by the Turks, or what they expected to gain by it. They probably refused the permission in the first place with the intention of treating him as an ordinary Turkish Vali, and sending his firman to be read in public at Tirnova by a Turkish official; but, after the failure of this plan, there was no obvious reason for treating him as they did at Constantinople. Some have supposed that it was intended as a studied insult to the prince, others that it was an elaborate practical joke played upon the Russian embassy, which had at one time suggested that it was unnecessary for the prince to come to Constantinople as other vassal princes had always done. But whatever may have been the motive which prompted this singular treatment, it only served to make the reception of the prince the next day at Varna more impressive, and to give more importance to the wild enthusiasm of his new subjects, who could not have received him with greater joy if he had himself just delivered them from the hated rule of the Turks. He was inaugurated at Tirnova, the ancient capital, and then went at once to Sofia, the new seat of government.

His first difficulty was the choice of a ministry. Two parties had already been developed in the constitutional assembly which adopted the constitution and elected the prince. They grew out of a difference of opinion in regard to religious liberty, freedom of the press, the right of association, with other similar questions, and at once assumed the names, Conservative and Liberal. The Conservative party included the clergy of the Bulgarian Church, and some of the best educated and most enlightened Bulgarians, who felt that too much liberty was a dangerous thing for a people brought so suddenly from bondage to freedom—who feared that the country would be flooded with nihilism, socialism, and other isms. The Liberal party, however,

had a large majority in the assembly, and was led with considerable skill by two or three experienced politicians who were wise enough to avoid extreme measures. When the prince arrived he attempted to form a ministry which should include the leaders of both these parties; but for some reason the majority of those selected were Conservatives, and the Liberals declined to serve with them, so that he has a Conservative ministry, with the probability that the new assembly will have a strong Liberal majority. This is an unfortunate beginning, as the party conflict which is likely to ensue will probably weaken the influence of some of the best men in the nation, who are really Liberal in their views, but who fear that absolute liberty will degenerate into license and sap the foundations of religion and morality. They do not think that the people are ready for "a free Church in a free state." They fail to see that the influence of the Church can only be strengthened by educating the clergy and reviving their spiritual life. The Bulgarians are naturally a religious people; but both while they were under the Greek patriarch and since they have received their independence, their Church has been an essentially political organization. It needs now to be spiritualized. The best men of both parties acknowledge this; but, as in all other countries, there is a difference of opinion as to how far it should be defended and supported by the state.

I have said that this division of parties was an unfortunate beginning for this new state, but after all it is far better that there should be real living questions before the people than that politics should degenerate into a new struggle for office. The very discussion of these questions will tend to educate the people and revive the Church, and it will probably be found that when a new Liberal ministry is formed the responsibilities of office will make it as conservative in most respects as the present government. The prince has the confidence of all the people, and will no doubt accept the result of the coming elections as a constitutional sovereign, and then direct the attention of the people to other questions of the utmost importance concerning the organization of the various departments of the government. No doubt serious difficulties will be encountered and mistakes will be made, but the spirit of the people is good. They desire good order, peace, and quiet, and they will make every effort to secure it. They merit the sympathy and good-will of all civilized nations, and especially of those who believe in free government and liberal institutions.

EASTERN ROUMELIA.

The condition of affairs in Eastern Roumelia is much less hopeful, as the difficulties encountered in the organization of the government are very much greater and more numerous. North of the Balkans they are only such as might be experienced by any new representative government in any civilized country, but in the nondescript province of Roumelia the people are suffering from evils inflicted upon them by the Congress of Berlin. Every thing is unsettled. No one knows who rules the country, or what is the form of government. It seems to be for the interest of certain parties to prolong this state of things and introduce as much disorder as possible. The people are kept in a constant state of excitement, and no one knows what to expect from one day to another. The Congress of Berlin is primarily responsible for this, and no doubt it was for the interest of Austria to keep up a state of anarchy and confusion in European Turkey. It was her plan to absorb the European provinces herself, and the way must be kept open to Salonica, and if possible to Constantinople. It is believed that England went to Berlin with a secret agreement to support these pretensions of Austria, but no one sees exactly how England is to profit by this arrangement. It is certain that no one in Turkey gained any thing by the division of Bulgaria; but the evils which have resulted would have been much less if, in addition to this division, the congress had not devised the extraordinary scheme of giving different forms of government to the two Bulgarias. This plan, of course, insured the permanent discontent of the whole Bulgarian nation; but, worse than

this, it made the impression upon the Turks and Greeks of that province that the arrangement for Eastern Roumelia was only a temporary one, and that by skillful agitation they might overturn it. They have not failed to improve this opportunity. The Phanariote and Roumelian Greeks are doing every thing in their power to create disturbance and cause difficulty in Eastern Roumelia. An unceasing torrent of abuse is poured out upon the Bulgarians by the Greek papers and their French organ, the *Phare du Bosphore*. They are full of false statements and misrepresentations of every kind, and a portion of the Greeks in the province act in full sympathy with these papers. Free Greece does not sympathize with this crusade, and an attempt was made a few weeks since to induce the Greeks here to come to an understanding with the Bulgarian Church by withdrawing the excommunication and arranging for harmonious co-operation. It is understood that the patriarch was in favor of this, but the Greek papers opposed it with a violence which was incomprehensible to the uninitiated. They declared that "the maintenance of the schism was the only hope of Hellenism," and appealed to the Porte to prevent by force a reconciliation "which would inevitably result in the union of Greeks and Bulgarians to drive out the Turks and divide the country between them." This opposition on the part of the Phanariotes prevented the execution of the plan.

The Turks, also, are doing what they can to create disturbance in the province, and find some excuse for occupying it with their army. This was, of course, to be expected, and is in some degree excusable. They naturally wish to regain possession of this rich province, and they feel that they have cause of complaint against the Bulgarians, who do not receive the returning refugees with much cordiality. There are real difficulties on both sides which can not fail to give rise to serious trouble. It is a pity that the whole arrangement could not have been left to a really impartial commission, free to act on principles of equity and common sense. The difficulties are such as these, for example. There are many towns where the Bulgarian quarter was burned by the Turks. When the Turks fled and the Bulgarians returned, they occupied the Turkish houses, and they are now naturally disinclined to give them up to the refugees and camp in the fields. Again, there are many cases where the Bulgarians were deprived of their lands in the most iniquitous manner some years ago, under the pretense of a new law in regard to title-deeds. These lands were seized by rich Turks, who fled during the war, but now come back to claim them. The Bulgarians have the original titles and the Turks new ones. To whom do the lands rightly belong?

There are other cases where Turks return who are known to have taken part in the massacres. There has been a general amnesty, but it can hardly be expected that these persons will be well received. These are only a few of the many difficulties connected with the return of the refugees which irritate the Turks and the Bulgarians both; and, in some cases, both parties merit our sympathy.

In addition to these deliberate attempts to make trouble on the part of the Turks, Greeks, and also of some few hot-headed Bulgarians who are foolish enough to suppose that a disturbance might hasten their union with the principality, the confusion in the government is a source of constant trouble. No one knows what the government is. The Porte claims supreme authority, and sends peremptory orders to the pasha. The pasha naturally considers himself the head of the government. The European Commission claims the right to exercise control whenever it sees fit. The consuls assume the right to intrigue or to dictate in the name of their respective governments. The administrative council, a majority of which is Bulgarian, considers itself to be responsible for the administration, and there is a constitution of hundreds of articles which is theoretically the law of the land. A national assembly is soon to be added to the list. The militia have been under the command of a Levantine Frenchman, who was not responsible to the governor, and who does not appear to have had

a single qualification for his office. Happily he has been replaced by a better man.

Having inflicted all this confusion upon Eastern Roumelia, the European Powers are complaining that the people do not know how to govern themselves! Perhaps they do not, but as yet they have had no opportunity to make the experiment. If peace and quiet is ever to be restored to this unhappy province, the government must be simplified and consolidated; it must be left to manage its own affairs, and to make the best it can of the elaborate constitution which Europe has conferred upon it. Alecko Pasha is not a great man, but he was the best man available for his position, and he is a man who is much more likely to throw up his office in disgust at the trouble which it gives him than to lend himself to any scheme for resisting the will of Europe. The Bulgarians, who constitute the majority of the population, are discontented at the arbitrary action which separated them from the Principality, but they are satisfied that they have nothing to gain from any present agitation of this question, and they only desire to be left to govern themselves in accordance with the decision of Europe, and to be assured that they will not be turned over again to the tender mercies of the Turkish government. The fear of this is universal, and it is this fear which keeps them in a state of constant excitement. It is not without reason. A large Turkish army is camped on their borders. The Porte is seeking some excuse for entering the province. Certain European representatives at Philippopolis are always threatening this, and the people believe that they are intriguing to bring it about. Every thing is in confusion and uncertainty in regard to the government, and nothing seems settled. There can be no peace and quiet in a country which is in constant fear of invasion, and something ought to be done to remove this fear from Eastern Roumelia. The Turkish army should certainly be removed, and the Porte should be warned to let Alecko Pasha alone, and allow him to organize his government as best he can. If this source of fear and irritation were removed the Bulgarians would accept the situation and make the best of it. It would be for their interest to do so, and an industrious, thrifty population is always quick to see what is for its interest.

It is not probable that the European Powers will allow any invasion of the country; but the Turks have always in hand the pretense of sending troops to occupy the Balkans, and this fact to some extent justifies the fears of the Bulgarians. If there were danger of another Russian invasion the Turks would be fully justified in occupying the passes at once, and there is nothing in Eastern Roumelia to prevent or even delay such an occupation; but under present circumstances, when there is nothing to be feared from Russia—when peace and quiet is the thing of all others to be desired—the occupation of the Balkans by the Turks would be a crime.

LIFE AND DEATH.

WHY would you have me dwell on death,
Rehearse the awful parting hour,
The creeping chill, the ebbing power,
The gasping for the latest breath?

Why vex a child 'neath noontide sky
With image of his nightly rest?
Just now his games, his toys seem best—
He will be weary by and by.

Just now a hand is linked in mine,
Just now thought flashes far and free,
I joy in every thing I see,
I call this God-made world divine.

Wait, till night fall at his behest;
Wait, till he hush to sleep through pain;
Wait, till he show me death is gain,
And give the wish and power to rest!

MAROUSSIA: A RUSSIAN LEGEND.

FROM THE FRENCH OF P. J. STAHL.

CHAPTER IV. A STORY OF THE BRIGANDS.

"I KNOW a little story about some brigands that made me think of it," replied the little girl. "I remembered how the wife of the brigand was saved in the story, and I said to myself, Perhaps we can do the same thing."

"Then as we have a long way to walk to the stable across the steppe, you will tell me the story, will you not?"

"Indeed, I will. But will you go on to Tchiguirine? I can lead you there."

"Certainly," replied the envoy. "But will your father approve of my accepting you as a guide? Will he not be displeased and scold?"

"I am trying to think just what he would do. My father looked at me. I understood him; his eyes said to me, 'To save him you must leave every thing, even us.'"

"Very well then. I put myself into your hands, little one. You shall lead me as you think best, and as we walk along you will tell me the story. Let's set out, Maroussia. I am listening to you already. I like stories about brigands ever so much."

She took his hand and began the ascent of the river-road. After a moment or two, as the child continued silent, he said to her:

"I am all ears, and I have heard nothing yet."

"O," replied she, "I can not begin to tell you the story this very minute."

"And why not, my little girl?"

"We are not far enough from the soldiers. I am listening for them all round. I am a little afraid that we— Oh, I should be so very sorry if we should not succeed."

"We must do just what seems best, happen what may, my little friend. We live by the grace of God and are in his hands, my child."

She raised her head and looked at him with her full dark eyes, and even by the uncertain light of the stars she saw in his face such confidence and courage as completely reassured her.

"Do not make we wait so long, Maroussia. I see you do not know how much I love stories."

Maroussia began, "There was once upon a time a Cossack who married his daughter to a fine, handsome young man."

"That's well done. Your story commences very well, if the husband was a brave fellow."

Maroussia shook her head from side to side instead of replying, and continued:

"The young girl had not much love for her betrothed. He was handsome, but there was something about his eyes which showed that he was not good. However, as her father was so anxious for the marriage she obeyed him. As soon as they were married the husband took his young wife to his own house away off; O, so far away."

"Poor girl," said the envoy. "Then she must have pined away for her father and mother."

"The husband's house was very beautiful; it was indeed superb—something like a chateau or a palace—but a sad place. It was built in a forest so thick and so dark that you could scarcely even see the sky through the branches of the great tufted trees. There was not a road, nor even a by-path, only the same look all around through the forest. The husband stayed at home very little with his wife. Embracing her affectionately he would say, 'I shall be back soon, my dear wife.' Then he would set out with his companions, and they would stay away sometimes two, three and even ten days at a time."

"That was very bad," said the envoy.

"When he came back he talked a good deal more with his comrades than with his wife. He gave her all kinds of jewels and ornaments, it is true; but this did not

satisfy the young wife. She felt very unhappy and by degrees fell into a deep melancholy. She said to herself, 'Since life is so sad, I am willing to die. Yes, for that is the end. The proverb is true, Sorrow returns often, but death comes only once.' One day when she had been left all alone in the great gloomy chateau, and when, in spite of the dark thoughts which possessed her, she felt full of life and strength, she said to herself, 'Why should I sit still here waiting for death without any thing to rouse or interest me? I will walk. I shall be just as likely to find some relief from my troubles in the grounds and flower garden as in the corner of this apartment.' And she ran out into the parterre, which made a little circle of flowers around the chateau between the great stone walls and the vast forest beyond. All was green and flourishing in the parterre. 'Die!' thought she, as she looked at the beautiful flowers, 'that does not seem to be the best thing just now. Ah, if I were but happy, I should love to live.'

"Then she wept; but in the midst of her tears she gathered a charming bouquet of lilies of the valley and wild rose buds, and it looked so beautiful, so gay, she said, as if talking to the flowers, 'O, where shall I put thee, my poor bouquet? my own grand chamber is so desolate, thou couldst only wither and die there? Then there came to her a new idea. 'I shall visit all other apartments of the chateau; perhaps amongst so many I may find a small one that will please me.' No sooner said than done; she went from one apartment to another; all were large, richly furnished and as beautiful as one could wish, but quite disagreeable. 'Not this one, no, and not this one will suit me,' she thought as she passed from one to another—"

Here the envoy put his hand upon the mouth of the little girl—"Wait a moment," said he, in a low voice.

"Did you think you heard something?" said the child.

The envoy bent quite low and held his ear close to the ground. When he arose—"The detachment has quitted your father's house," said he. "The soldiers have gone away in a gallop toward the left. If they had carried away prisoners they would not ride so rapidly, Maroussia. I believe your father's house is once more safe and quiet."

"Thanks be to God," said the child.

Then they walked for some time in perfect silence, both occupied with their own thoughts. It was the envoy who broke the silence:

"The young wife went from one chamber to another without finding one to suit her fancy, and she said 'no, I will seek further.'"

"Yes," said Maroussia, "that is just what she said. Suddenly she saw before her a door unlike the others, very narrow, but firm and strong and bolted, which had a very singular look. 'Ah,' said she to herself, 'it is the room behind this little door that will suit me I am sure.' Then she tried to open it, but the door remained firm, and the more it resisted the stronger was her desire to open it."

"Ah, yes," said the tall friend, "I see; that is just like all young women."

"What did you say?" replied the astonished little girl.

"I said that all young women wanted to know what was behind a closed door."

"And would not men feel so too?" said the girl.

"Generally they are more reasonable under such circumstances."

"More reasonable?" replied Maroussia with a puzzled air. "Then reasonable means that they do not desire a thing enough to accomplish it?"

"Do you know, my little girl, that you have said a very sensible thing?" said the envoy laughing. "However, it would be wiser to say that it is more reasonable not to have too great a desire for any thing. But go on with your story, Maroussia. Did the poor young woman end by opening the door?"

"Yes," replied the little girl; "she occupied the greater part of the day in cutting away the door, and by long clipping she succeeded in forcing back the lock, and entered the mysterious room. At first she thought she was in a box, it was all so dark. Satisfied with having succeeded in gaining

an entrance she could not resist, as her foot crossed the threshold, uttering an exclamation of satisfaction; but when from the four corners of the dark chamber her 'Ah,' reverberated again and again, she was greatly astonished, but not so frightened as one might suppose, for she concluded after a a moment's reflection that the room had a peculiar echo simply from the fact of its being very small and entirely unfurnished. Indeed, as her eyes became accustomed to the obscurity, she saw that she was right in her conclusion, and that because of the emptiness of the room the echo resounded from wall to wall. She groped her way around the walls, but her fingers could discover neither door nor windows. The four walls were perfectly smooth every-where. Much discouraged she was about turning back when suddenly to the right of the little door by which she had entered, her hand struck against a table, upon which she found a lantern and every thing necessary to light it; but the lantern showed no other means of exit from the room. Nevertheless she persisted, saying to herself, 'This box-like room is not all; it must conduct to some other place; there is doubtless a concealed passage. I shall not go out till I have found it.'"

"That was very obstinate in her," said the envoy.

"O no, what would you have her do? she was impelled to it, she had an idea. Perhaps she said to herself, 'When my husband returns he will find fault with my curiosity.' But all the same she continued her search."

"Long live feminine perseverance," said the envoy, who followed the recital of Maroussia with great interest.

"She walked carefully round the room many times, and at last her foot struck against an iron ring. She brought the lantern close to the floor, and discovered a trap-door. It seemed to her that never in her life had she been so rejoiced. The door was very heavy for her; but when one wishes to do a thing very much you know one always finds some way to accomplish it. She almost broke her ten fingers, but at last succeeded in raising the door. Then she saw steps as straight as a ladder, which led into a great dark hole. She had started, and could not stop. 'No matter,' said she; 'though it does look very terrible, I will go down,' and immediately she descended the steep ladder."

"She was certainly very brave," said the envoy.

"She expected to see something wonderful; but what she did see was more horrible than any thing she had ever dreamed of."

"O my, what could it have been?" said the envoy.

"Why, this cellar was covered, almost filled, with axes, swords, poniards, pikes, lances, terrible knives, and clubs, and besides splendid clothes covered with blood, necklaces of pearl, ornaments glittering with diamonds, jewelry set with rubies, emeralds, turquoies, sapphires, besides richly embroidered cloth. All these were thrown together in confusion, and every-where there were traces of blood.

"She was still doubtful as to what all this meant, when her eye was attracted by something white as snow hanging loosely from a piece of black velvet. She hardly dared believe her eyes. It was a white hand—white as a hand of marble cut off from the arm. It was a lovely, graceful woman's hand covered with precious rings. She could no longer doubt, but said to herself as she trembled and shivered with horror, 'My husband is the chief of a band of brigands. Our chateau is worse than a robber's cave;' and the thought was terrible to her."

Maroussia was silent for a moment. Her little hand was icy cold, even in the great warm hand of her brave companion. The envoy perceived this. The history was too exciting, and he reproached himself for allowing the poor little guide to relate it.

They walked on in silence for a while. The lilies and rushes on the border of the water rustled slightly, for the breeze was scarcely sufficient to agitate them. "Stop a little in your story," said the envoy. "It might make you ill to go on to the end, especially if it is still more terrible."

"Yes, more terrible, perhaps; but that does n't matter. It 's from the end that you will understand my idea," and feeling a good deal strengthened, Maroussia continued:

"The young wife thought a great deal about what she had just discovered, and she asked God to help her and teach her what to do. She must get away as soon as possible from the dreadful cave. So she ascended the stairs, closed the trap-door carefully, put the lantern just where she had found it, shut the door behind her as closely as possible, and more dead than alive sought her own room. She was a hundred times more unhappy since her discovery. Yet she did not wish to die; she only thought of saving herself. But how was she to do that?"

Here Maroussia started and trembled. She heard a noise as if some one or something had fallen or been thrown into the river.

"Do n't be frightened," said the envoy; "it is only an animal, an otter, perhaps, that wants to get across the water; perhaps a big fish, who has thrown himself into the water from some place higher than ordinary."

"Yes, yes," said Maroussia, "that 's all, I reckon," and immediately went on with her story.

"'What am I to do?' said the poor young lady. The vast, interminable forest surrounded her on every side. There seemed to be no opening anywhere. She might wander through it at the risk of tearing her poor flesh against the thorns and thick undergrowth; but even then could she tell where she was going? It is so easy to be lost in a great forest. Perhaps, after wandering about all day she would find herself at the same point from which she started, and in the presence of her angry husband. 'What shall I do? what shall I do?' she kept repeating to herself. 'If I perish on the road,' said she at last, 'I must leave this place, and I will do it.'"

"That 's what I call true courage," said the envoy. In spite of the grave preoccupation which almost absorbed him, this true man was very attentive to the recital of his little companion as they walked along their perilous road.

Maroussia perceived this by his timely comments, and it pleased her. She said to herself, "This interests and diverts him." She would willingly have abridged the story; but, she thought, perhaps the envoy would not then comprehend it quite so well, and, besides, they had plenty of time, he to listen and she to tell her story, for the cabin of the steppe and the stable of the big oxen were some distance off. The child resumed:

"The poor lady descended again to the parterre. She examined the net-work of trees—this green wall which surrounded and barricaded the chateau. The trees were so close one to another, and they rose so high, so high that she could scarcely see the topmost branches even when she leaned far, far back. 'Nevertheless,' thought she, 'when one wishes to find one's way out of a place, a road is the first thing that must be looked for,' and then she turned to the right. But she had gone only a few steps when she heard the sound of horses' feet pawing the ground. She stopped, holding her breath, and, concealed by the trunk of a large tree, listened attentively. She could not be deceived; it was certainly the noise made by a troop of horsemen riding cautiously over difficult ground. 'Shall I stand still or advance?' thought she. She had repeated this question twenty times to herself, when she saw the pale face of her husband emerging from the undergrowth, which he put aside with his hands. His usual companions followed him, and they had the appearance of coming out as if by magic from the green foliage, for there was no trace of a road through it. She had only just time to conceal herself in the thicket, and from her hiding-place could see her husband distinctly. He had gotten down from his horse, and was walking very slowly. 'What dark, heavy thoughts can cause him thus to walk with slow step and downcast eyes? If it were any other man,' said she to herself, 'looking as he does at this moment, he would have my sincerest pity. As for his companions, how ferocious they look! What frightful figures they wear!'

"Her husband passed very close without suspecting her presence. The others also,

without looking to the right or left. She saw with horror that several of them had traces of blood upon their garments. Very soon she heard the voice of her husband calling her. The moment had not yet come when she might fly from him forever. She came out bravely from the thicket, and advanced toward him.

"'You are very pale,' said he to her; 'it seems to me you tremble. You will take cold under these trees. Do n't venture here again.' Then drawing from his pocket a small box, he said, 'See here, I thought of you while away,' and he presented her with a ring which sparkled like the sun itself. 'Would n't you like to have that?' She took, if we might so express it, her heart in both her hands to prevent her refusing the offered gift, and asked him where he found a jewel of such rare magnificence. 'If my question embarrasses him,' she thought, 'if I see a trace of trouble on his face, it will be a proof that he is not altogether hardened.' But he replied quite gayly, 'I secured it in the chase, my love.'

"'In the chase?' said she. At the same time she thought, 'I am determined to go to the bottom of this. I am determined to know, and from himself, what hope I may have for the future. Then she added, 'A chase for jewels? Surely, that is a new kind of sport, and of which I never heard save from yourself. In all my life I never heard of such a singular game.'

"'Not so strange as you think,' said he, 'but unquestionably very fatiguing. So wearying, indeed, that after it is over the bravest, the most intrepid need repose, and that is my case at this moment, my dear. So, with your permission, I and my men will at once seek this much needed rest, for I am dying for sleep. After a few days, if you are very good, I will take you with me upon one of these excursions, and I hope you will find it very pleasant.' Saying this, he left her, laughing—a laugh that made her heart sink—and went to his rooms in the wing of the old building, which he and his companions in crime occupied.

A few moments afterwards she was the only one awake in the great chateau. When she had assured herself of this she said, 'Now is the time to save myself.'"

At this moment the envoy felt the hand of little Maroussia tremble violently in his own.

"What is the matter?" said he to her.

The child put her finger to her lips to indicate silence, and showed him two green eyes shining in a large bush on the other side of the pathway. The envoy had a stout oak club in his hand; so he went straight toward the bush.

"Take care," said the little girl. But the envoy had already struck at the bush. She heard a singular noise—the noise of the wings of an immense bird of prey, which, disturbed in his retreat, flew heavily past them, uttering a dismal cry.

"Is that a bad sign?" said Maroussia.

"No, it is not a bad sign," said her big, brave friend, giving her a little tap upon the cheek.

Maroussia at once continued her story:

"To recover her strength the poor lady sat down at the foot of a moss-covered rock, which seemed to be held firmly between the great roots of a giant tree. She was very light, but so quickly did the rock turn under her weight that she instantly fell backwards."

"Good," said the envoy; "she has found the bandits' pass-way."

"Yes, it was the pass-way—their mysterious door. She was so astonished by her fall that she lay still a few minutes without daring to move. Where was she? Above her head and all around her, in the form of a vault, was a dark, green gallery, into which the light filtered like microscopic stars, and the rays entered in penciled beams, and here and there tiny points of the blue sky were visible. Recovering from her surprise, she arose, marking with a peculiar white stone the place of invisible entrance, and had the wisdom to retire to the chateau to assure herself of what her husband and his comrades were doing.

"They all slept profoundly, as is the case with those who have made unusual exertions. Upon tiptoe she went from door to door, without noise drawing the bolts and closing all the blinds.

"This was a good precaution; and then she took another, which was no less so. Quickly changing her customary white apparel for a black dress, she promptly walked with an apparent calmness to the spot marked by her white stone. When she had found it, she said, 'O God,' and heaved a deep sigh. But she had no time for sighs. She leaned against the rock, as at the first time, and was thrown to the ground as before. This high stone door, which resembled a rock, was arranged so as to close of itself. She was at once on her feet and standing under the gallery. She started to walk, and soon began to run. At the end of half an hour she found herself at a point where more than three roads met, all leading in different directions. Which one should she take? This was very embarrassing."

"It certainly was," said the envoy.

"She took a few steps in one and then in another, following them a little way as if to try which was the best. It was so important that she should not be deceived, and the misfortune was they were all so alike it was very difficult to prefer one to another. However, at the entrance of one she saw something white, and, running toward it, she found a small, very fine handkerchief, beautifully embroidered in each corner.

"I hear something following us," said Maroussia, interrupting her recital. The envoy heard it also. He turned around and took Maroussia by the arm; and putting her behind him, stood with his stick raised. "Ah," said she, "it is—it is a great big dog." The envoy made a bound so suddenly that the child could not understand it, and with one stroke of his stick felled the animal that had taken them by surprise. What was passing between the beast and the man? The envoy knelt upon the ground. In an instant afterward he arose, and the animal lay without life at his feet.

"It is a wolf," said he quietly to the child, "and he must have been very hungry to have followed us for his prey."

Maroussia looked at the dead wolf, then at her brave friend and said:

"You are not afraid of any thing."

"O yes," said the envoy; "I am very much afraid of every thing that interrupts your story. The wife of the bandit had found the handkerchief—"

"Yes," said Maroussia, "and the sight of this fine handkerchief, that could never have belonged to a man, set her to thinking.

"'They must have gone over this road, this very morning,' said she; 'and if that was the case they would probably have nothing more to tempt them, and that makes it best for me to choose this one.' But before going farther, a good idea struck her to untie a pretty red ribbon fastened at her throat, and tie it to a branch which hung across the path opposed to the one she was about to take, in such a way that it could be seen at a great distance. 'They will see that bright ribbon, and start in my pursuit by the road I have not taken.' That was not a bad device for their deception, was it?"

"No; that was very ingenious," said the envoy.

"Content with having thought of that, she darted like a hind along the road where she had found the embroidered handkerchief. She ran almost the whole day. Evening came, and the obscurity was so complete that she could no longer discern what was above her head—whether it was a vault of rocks or a dome of foliage. 'I must walk on and on all the time,' said she when weariness overcame her. 'God, who has led me thus far, will not desert me, I am sure.' Suddenly she was brought to a full stop. The road here made a sudden detour, and she came in violent contact with some obstruction; but instead of complaining of what had befallen her, she was ready in her surprise to utter a cry of joy. All the stars of heaven were shining brightly above her head. Neither an arch of stone nor of dark interlaced trees hung above her; she was in a wide, open clearing."

"Ah! so much the better. That relieves me for her," said the envoy.

Maroussia by way of reply only shook her head, and held to his hand more tightly.

"Unhappily the poor wife of the chief of the bandits had not a long time to rejoice, for she at once heard voices, cries, and the noise of horses at a full gallop. What could

she do now? where could she find refuge? how might she become invisible? By re-entering the forest glade? Never. She could not take one step in return to the chateau. There was in this clearing one large oak with thick, heavy branches reaching nearly to the ground. In the twinkling of an eye, from branch to branch, like a frightened linnet she climbed almost to the top. She did well not to lose a moment, for in one instant after the whole troop of bandits rode forth from several sides at once; for all these avenues opened into the same clearing.

"'Well?' cried the familiar voice of one of the cavaliers who had just arrived.

"'Nothing,' replied one of them; 'I have found only this,' and he showed them the bit of red ribbon.

"The chief did not care for the ribbon. Did he even know what color his wife wore? Ah, he was too indifferent for that.

"'I have seen no one,' replied another.

"'No trace of her,' said a third.

"And thus answered the whole company.

"'Let us search longer still,' replied the husband. 'Dead or alive we must find her again. Come, set out, our salvation depends upon it.'

"Scarcely had he finished the sentence when some object caught his eye. Bounding quickly from his horse he stooped down and picked up something, which he examined attentively.

"'A handkerchief,' cried one of the others. 'A woman's handkerchief. The one we are looking for can not be far away.'"

"Oh, how unfortunate," said the envoy, "that she should have found the handkerchief and lost it again."

"The grass was very high and thick; so they all set to work to beat about them; some with hands and feet, and others with swords and pikes, others trampling the bushes under their horses' feet, or hacking them with their small axes to assure themselves that the fugitive had not there sought retreat. But they found nothing at all.

"In the meantime the husband, looking about on every side, discovered the oak tree. 'The foliage of that tree is very thick,' said he; 'but women are like birds. Who knows if my wife may not be among its branches?' He took a lance from one of his men, and, climbing to the lower branches, he was compelled to hold on with one hand, whilst with the other he thrust his lance in among the higher branches."

"Poor woman," said the envoy, "what will she do?"

"How fortunate it was that she had put on her black dress. Thanks to this color of the night her husband could not see her. He pierced the thick foliage with his lance, groping about in the dark by chance and again selecting the thickest portions of the growth. Terrified, mute, immovable, holding to the smaller branches for support, she commended her soul to God, praying him to make her body invisible. Three times the cold iron pierced her flesh, but she did not stir. She was very brave; she uttered no cry, not even an exclamation of pain."

"That is heart-rending," said the envoy. "Your story is heart-rending, Maroussia. Oh, the poor woman!"

Maroussia quite absorbed in her story continued;

"The lieutenant of the band seeing that his search was useless, said to the captain, 'We are losing time in this clearing and giving all the advantage to the one we are looking for. The village is near and the city is not far away. At this rate she will get there before us; no doubt she has already arrived."

"The thought that his wife, entirely mistress of his secret, might escape him, and that his mode of life would be known, brought a terrible cursing from the captain. 'To horse, to horse,' cried he. 'We will search to the ends of the earth.' Thus encouraged they set off again at a furious rate. It was time. The poor woman could no longer hold on to the tree. The next moment she fell upon the grass at the foot of the tree, almost at the risk of life."

At this moment Maroussia took a step backwards. "Did you hear that?" said she.

"It was only the report of a gun," said the envoy. "That is the third time that I have heard it since we have been walking. Do not let it trouble you, it is before us and a great way off. In times like these a single

gun or many together may be heard anywhere. It is not in our direction they are shooting, nor toward the house of your father."

"Are you right sure?" said the child.

"Very sure. If we hear any more shooting do not be afraid, we must expect noises about us; and now return to your story."

"The poor woman was on the ground, and I don't know how many hours she stayed there, almost exhausted. When she came to herself the night was not quite so dark. Indeed, a faint streak of the early dawn had already appeared on the horizon. The birds began to sing, and the grass, wet with the dew, seemed as if thickly strewn with bright glistening pearls. She still had strength enough to staunch the blood which flowed from her wounds, tearing her fine white skirt in pieces to make bandages. Would she be able to walk? She had lost so much strength, but walk she must, though it would be with great pain, for her arms and side were wounded by the cruel lance. She boldly made the attempt, and little by little her strength returned."

"I like that brave little woman," said the envoy.

"Very soon she saw that she was on a great highway, and this gave her courage. But in spite of her courage she could not have gone very far, and felt herself growing weaker, when to her great delight she heard the noise of wheels. An enormous wagon loaded heavily with hay advanced slowly, drawn by two strong oxen with great twisted horns. By the side of the wagon walked an old man, carelessly singing a war song. Hastening her steps she soon overtook the driver. 'Oh, save me,' said she to the old man. 'Have pity on me, for I have not strength to walk to the village.' At the same time she heard in the distance the cries of the brigands returning from their unsuccessful chase. Daybreak doubtless forced them to return, for such as they could not travel in open daylight. 'I am lost,' said she, 'if discovered by those men who are coming, and my husband is their chief.'

"'Conceal yourself in the hay,' said he to her, 'and be as quiet as you can, quick!'

"A good, brave old man," said the envoy.

"Immediately she hid herself under the hay, and lay without moving a muscle. In a very little while the brigands had come up to the wagon, which rolled heavily and slowly on its way.

"'Halloo, there,' cried the chief to the old man, who walked beside his oxen, quietly smoking his pipe; 'have you met on your route a young woman who seemed to be running away?'

"'A young woman?' repeated the old man striking his forehead, as if trying to collect his thoughts.

"'Yes, a young woman.'

"'Stop a minute, a young woman?'

"'Will you answer my question?'

"'Why not?'

"'Answer me then.'

"'I have n't seen any young woman.'

"'Are you sure of that? She must have taken the same road you've come over.'

"'Ah! you may know that. I can't say. I have n't seen any body. I can't see so well these last two years as I used to. You can't expect a man's good sight to last forever.'

"'This man looks like a cuning fox,' said the lieutenant; 'he's mocking us.'

"'Do you know whom you are dealing with?' said the chief to the old man.

"'How should I know,' replied the wagoner. 'I guess it is the first time we ever talked together. Besides, whoever you are, grand lords or brigands, what can that matter to an old man like me, who has scarcely a copeck to cross himself?'

"'You have your life,' said the lieutenant.

"'My life,' rejoined the peasant. 'Yes, I make my living by my head; but I can't say it's so very agreeable to live as hardly as I do.'

"'Well, we'll leave you your life, old man; but I think we'll take your hay.'

"'This is not my hay. When one says that he has n't any thing in the world, he can't mean that he has a mountain of hay like that to put in his pocket. If you want to steal it, may be you can; but you'll have to give me a little scratch of the skin first. If I go back without any money and with-

out the hay, the master, who isn't any too good natured, will say I've sold the hay and spent the money for drink. I guess I might as well be beat by you as by him.'

"'You old fool,' replied the lieutenant, who could scarcely restrain a smile, 'we don't want any more hay than a feed for our horses.'

"'O, very willingly,' said the old man; 'but let me serve you myself. I can take off just such bunches as will make the load look as if it had n't been touched, and, you see, if I can make it look all right, I can get the same price for it, perhaps.'

"The old man was wrong to tell a falsehood," said Maroussia, "but I guess he was puzzled and a little scared.

"'There, have you got enough?' said he after lifting off very cautiously a dozen bunches of hay from his wagon. 'There, I can't take much more, or my skin will have to pay for it. If the master does not count his bundles of hay, this will pass.'

"The lieutenant made a sign with his head to indicate they had enough, and the captain then addressed himself to the peasant:

"'You can go on now; but I have two pieces of advice to give you. The first is, don't turn your head to see what's passing behind you, and the second, don't tell any body about this adventure.'

"'Yes, yes, I know how to keep a secret,' replied the peasant with the most innocent face. 'I shall follow your advice,' and he touched his oxen as a signal for starting.

"At the end of ten minutes they could barely hear the galloping horses of the robbers. The sound grew fainter and fainter, and presently all was silent.

"'They have entered the wood,' said the old man, as if talking to himself; 'but that is no reason why we should sing for joy yet awhile.' The advice was good, and she followed it.

"The young woman buried in the hay did not move, scarcely daring to breathe, till she was once again on safe ground. A half hour later the village—indeed, it was a pretty little town—was seen, and soon after the wagon rolled slowly along the principal street as if nothing had happened, and they entered the wide open gate of a court-yard.

"'Come,' said the old man; 'God be thanked, that was well done.'

"And this was the way that the wife of the captain of brigands was saved at last. They took her to a charitable asylum, where every body was well cared for, and there she remained till her father, already apprised of the miserable marriage he had made for his daughter, came and took her to his home.

"They encircled the forest, thus hoping to take the brigands in their hiding-place; but they were too late. The chateau was abandoned when the magistrate arrived. Feeling the danger of being discovered, they dared not remain there a day longer."

"So much the worse," said the envoy; "but the poor woman was saved, and that's the principal thing. My faith, your story is a very interesting one, and you were very right to give it to me in detail. A good story makes a short journey."

"I told you that," said Maroussia, "because I thought it would be of use to us."

"Yes, yes, my child, I understand that, and we understand each other."

CHAPTER V.

It was still night, but the morning breeze had sprung up, and from a distant convent they could distinctly hear the matin hymn. The rushes on the river bank were full of singing birds, and the water, which had flowed so smoothly up to this point, here encountered rocky barriers, over which it tumbled, foaming and boiling and forming beautiful cascades, and was finally precipitated into a kind of gulf.

"Now we must turn to the left," said Maroussia.

Two minutes after, they entered the steppe. Up to this time they had walked along the bank of the river, shaded almost the whole way by the trees. Maroussia and the envoy, although they felt pressed for time, stopped involuntarily, and took in a full breath of the sweet, revivifying air of the plain.

"Look off to this side," said Maroussia. "The dark object you see away down there is the stable of which I was telling you.

Now we must turn again to the left. The oxen are there."

"Let us keep to the left, then," said the envoy.

The steppe rolled away before them as boundless as the ocean. Only great stacks of fresh hay were in sight. The envoy climbed upon one of these to scan the horizon.

"Do n't stand up," cried Maroussia to him. "You are too tall. You can be seen from a great distance, like a tower clock."

Every thing looked quiet. The envoy made a sign to Maroussia to climb up beside him, and he wanted to assist her; but this was unnecessary, for she sprang to the top of the stack in an instant.

"You have wings," said the envoy.

"Father calls me his little squirrel," replied the child with a touch of pride. Then she looked around, but only in one direction—toward the house of her parents.

"Look down there," she said. "You look for me; my eyes can not see well at this moment—but it seems to me all is quiet there."

"O yes, yes," said the envoy, "every thing seems to say, 'Be calm—all is right.'"

"They are asleep, all those I love so well, after having prayed for us, too, I am sure. Let us pray for them," and the tearful eyes of the child were raised to heaven in a prayer to God.

"Happy father, happy mother, to possess such a child!"

Calmer and stronger they descended from the stack. They took a few steps, and came to a quick-set hedge, which surrounded a little valley.

"This is the place," said Maroussia. "Now help me to raise the bar of the door. There are the oxen. Do you see?"

"Yes, I see them, and they are magnificent."

The two oxen lay in the high grass as still and immovable as the mountains. Maroussia caressed with her little hands the great horned heads. A soft low of welcome replied to the caress of the little girl.

"Hush, hush," said Maroussia; "you must follow me quite softly. Quick, now!"

One would have thought that the oxen understood thoroughly the words of their little mistress, for they got up without any noise and followed her cautiously. The wagon filled with hay was not far off.

"Now let us yoke them," said the child, when they approached. The wagon was soon in readiness. "Make haste," said Maroussia. "Why do you look at me in that way?"

"Because you are so small, Maroussia, so very small. One might easily take you for a little meadow-lark made only to fly and sing across the steppe instead of one able to manage great affairs."

The envoy was right. This little girl did look very tiny and delicate in the midst of this vast extent of verdure, and beside those enormous oxen and the big wagon, as she looked so earnestly in the face of the giant Setch.

"O, I wish I was big," said the little girl; "here is mamma's handkerchief; I am going to put it over my head like the old women wear them, and then they will not think I am so young. Look, is not that better?" Her great brown eyes looked out at him from under the dark handkerchief, which entirely covered her blonde head and rosy shoulders.

The envoy could but regard her tenderly, and with a smile. For a moment he neither wished to speak nor could he have found voice for a word. When at last he was able to reply his voice was quite soft—so gentle, indeed, that it scarcely seemed like his own. "You know the road well, Maroussia?" he said.

"O, I know the road very well. We must keep to the right till we reach the lake. When we reach the lake we will turn again to the right, and then we will soon see the roof of Master Knich's house, and once there we will find no difficulty in reaching Tchiguirine. I remember well when I heard Knich say to my father, 'Even a simpleton could keep that road.'"

"Do you know this Knich?"

"O yes, he comes very often to our house."

"And he will make us welcome?"

"I do n't know much about that, but I think so."

"Suppose he should receive us ill?"

"But he would never betray us, I am sure of that; he is a friend. O no, my father's friend could never be a traitor."

"Do you know, Maroussia, that the country is full of strangers?" said the envoy, looking steadily into the face of the little child. "Do you know that we may meet soldiers, rough, heartless men, who are our enemies and will be armed with swords and guns? do you know that blood is flowing every-where—do you know that?"

"Yes, I know all that," said Maroussia.

"Wicked eyes are acting as spies upon us. They will ask questions, every one of which will contain a trap, and if you reply awkwardly, if you allow a gesture to escape you, a word or a blush of confusion, if you tremble ever so little, all is lost. Do you know all this?"

"O, I'll not reply awkwardly. I shall say what is right and I am not a bit afraid."

"It may be, little one, that we are going into death itself."

"No, no," said Maroussia, "we shall not die till afterwards. You must reach Tchiguirine first. When once you are at Tchiguirine I can die if it be necessary. Then I shall not be afraid to die. But you must first be at Tchiguirine. O yes—"

The envoy said nothing, but he took the child in his arms and pressed her gently to his heart, calling her very tenderly his "darling child."

"Maroussia," said he, after a moment's silence, "we will be very sure to have some ugly encounters. The soldiers will stop you and question you. If they approach the wagon with the intention to search it, you must be very calm. You must not look like a frightened partridge which sees some one approaching the nest she had so carefully hidden away. You understand me?"

"Yes, I understand. I must be—I must be—like you. Yes, I will be so."

"If any one asks you where you are going, you must say that you are taking this wagon of hay to the country house of Knich, who has just bought it from your father. Do you understand?"

"Yes, that is all right."

"If we arrive safe and sound at his house Knich will come out upon his door-step to receive us, surely. Then you must say to him, 'What beautiful grain you have in your field? I have been admiring it as I passed, it is still very green; but I think it would be best for you to use it before it is quite ripe.' That is a very long sentence, my little girl, do you think you can remember all the words just as I have said them?"

"Yes," replied Maroussia; "listen, I will repeat them." Then she repeated the sentence word for word.

"You are a little treasure," said the envoy. "Now let's make haste."

He climbed up on the wagon, made a great hole in the hay, and concealed himself securely.

Maroussia stepped into the place usually occupied by the driver, encouraged the oxen with her childish voice, though at first it trembled a little, and the heavy wagon shook and groaned as it moved slowly away.

The day was just beginning to dawn, faintly touching with roseate hue the eastern horizon. The morning breeze was refreshing and the drops of dew sparkled in the green grass with an almost dazzling luster.

"OLD MORTALITY."

EVERY one who has heard of the Scottish Covenanters knows who "Old Mortality" is. Even those who know little about the history of the Kirk of Scotland, or of its heroes and martyrs, are familiar with this name through the pages of Sir Walter Scott. In the opening chapter of his historical romance he introduces the strange personage who gives the title to his tale:

"One Summer evening as I approached a deserted and lonely burying-ground, I was somewhat surprised to hear sounds distinct from those which usually soothe its solitude—the gentle chiding, namely, of the brook, and the sighing of the wind in the boughs of three gigantic ash trees, which mark the cemetery. The clink of a hammer was on this occasion distinctly heard; and I entertained some alarm that a marchdike, long meditated by the two proprietors whose estates were divided by my favorite brook, was about to be drawn up the glen, in order to substitute its rectilinear deformity for the graceful winding of the natural boundary. As I approached I was agreeably undeceived. An old man was seated upon the monument of the slaughtered Presbyterians, and busily employed in deepening with his chisel the letters of the inscription, which, announcing in Scriptural language the promised blessings of futurity to be the lot of the slain, anathematized the murderers with corresponding violence. A blue bonnet of unusual dimensions covered the gray hairs of the pious workman. His dress was a large, old-fashioned coat of the coarse cloth called *hodden-gray*, usually worn by the elder peasants, with waistcoat and breeches of the same; and the whole suit, though still in decent repair, had obviously seen a train of long service. Strong clouted shoes, studded with hobnails, and *gramoches* or *leggins*, made of thick, black cloth, completed his equipment. Beside him, fed among the graves a pony, the companion of his journey, whose extreme whiteness, as well as its projecting bones and hollow eyes, indicated its antiquity. It was harnessed in the most simple manner, with a pair of branks, a hair tether, or halter, and a *sunk*, or cushion of straw, instead of a bridle and saddle. A canvas pouch hung around the neck of the animal, for the purpose, probably, of containing the rider's tools, and any thing else he might have occasion to carry with him. Although I had never seen the old man before, yet from the singularity of his employment, and the style of his equipage, I had no difficulty in recognizing a religious itinerant, whom I had often heard talked of, and who was known in various parts of Scotland by the title of 'Old Mortality.'

"Where this man was born, or what was his real name, I have never been able to learn; nor are the motives which made him desert his home, and adopt the erratic mode of life which he pursued, known to me, except very generally. According to the belief of most people he was a native of either the county of Dumfries or Galloway, and lineally descended from some of those champions of the Covenant, whose deeds and sufferings were his favorite theme. He is said to have held, at one period of his life, a small moorland farm; but, whether from pecuniary losses or domestic misfortune, he had long renounced that and every other gainful calling. In the language of Scripture, he left his house, his home, and his kindred, and wandered about until the day of his death, a period of nearly thirty years.

"During this long pilgrimage the pious enthusiast regulated his circuit so as annually to visit the graves of the unfortunate Covenanters who suffered by the sword, or by the executioner, during the reigns of the two last monarchs of the Stuart line. These are most numerous in the western districts of Ayr, Galloway, and Dumfries; but they are also to be found in other parts of Scotland, wherever the fugitives had fought or fallen, or suffered by military or civil execution. Their tombs are often apart from all human habitation, in the remote moors and wilds to

which the wanderers had fled for concealment. But wherever they existed, 'Old Mortality' was sure to visit them when his annual round brought them within his reach. In the most lonely recesses of the mountains the moor-fowl shooter has been often surprised to find him busied in cleaning the moss from the gray stones, renewing with his chisel the half-defaced inscriptions, and repairing the emblems of death with which these simple monuments are usually adorned. Motives of the most sincere, though fanciful devotion, induced the old man to dedicate so many years of existence to perform this tribute to the memory of the deceased warriors and martyrs of the Church.

"In all his wanderings the old pilgrim never seemed to need, or was known to accept, pecuniary assistance. It is true, his wants were very few, for wherever he went he found ready quarters in the house of some Cameronian of his own sect or of some other religious person. The hospitality which was reverentially paid to him he always acknowledged by repairing the grave-stones (if there existed any) belonging to the family or ancestors of his host. As the wanderer was usually to be seen bent on this pious task within the precincts of some country churchyard, or reclined on the solitary tombstone among the heath, disturbing the plover and the black-cock with the chink of his chisel and mallet, with his old white pony grazing by his side, he acquired from his converse among the dead the popular appellation of 'Old Mortality.'"

The first edition of the story appeared in 1816. In the Introduction to a subsequent edition some authentic details are added to the traditional account of "Old Mortality." His name was Robert Paterson, son of Walter Paterson and Margaret Scott, who occupied a farm of Haggisha, in the parish of Hawick, during nearly the first half of the eighteenth century. Here Robert was born, in the year 1715. When the Highlanders were returning from England on their route to Glasgow, in the year 1745–6, they plundered Mr. Paterson's house at Gatelowbrigg, and carried him a prisoner as far as Glenbuck, merely because he said to one of the straggling army that their retreat might have been easily foreseen, as the strong arm of the Lord was evidently raised, not only against the cruel and wicked house of Stuart, but against all who attempted to support the heresies of the Church of Rome. From this circumstance it appears that "Old Mortality" had, even at that early period of his life, imbibed the religious enthusiasm by which he afterward became so much distinguished.

The religious sect called Hill-men or Cameronians was at that time much noted for austerity and devotion, in imitation of Cameron, their founder, of whose tenets "Old Mortality" became a most strenuous supporter. He made frequent journeys into Galloway to attend their conventicles, and occasionally carried with him grave-stones from his quarry at Gatelowbrigg, to keep in remembrance the righteous whose dust had been gathered to their fathers. As his enthusiasm increased his journeys into Galloway became more frequent, and he gradually neglected even the common prudential duty of providing for his offspring. From about the year 1758 he neglected wholly to return from Galloway to his wife and five children at Gatelowbrigg, which induced her to send her eldest son Walter, then only twelve years of age, to Galloway in search of his father. After traversing nearly the whole of that extensive district, from the Nick of Benncorie to the Fell of Barullion, he found him at last working on the Cameronian monuments in the old kirkyard of Kirkchrist, on the west side of the Dee, opposite the town of Kirkcudbright. The little wanderer used all the influence in his power to induce his father to return to his family; but in vain. Mrs. Paterson sent even some of her female children into Galloway in search of their father for the same purpose of persuading him to return home; but without any success. At last, in the Summer of 1768, she removed to the little upland village of Balmaclellan, in the Glenkens of Galloway, where, upon the small pittance derived from keeping a little school, she supported her numerous family in a respectable manner.

There are few church-yards in Ayrshire, Galloway, or Dumfriesshire, where the work of his chisel is not yet to be seen. It is easily distinguished from the work of any other artist by the primitive rudeness of the emblems of death, and of the inscriptions which adorn the ill-formed blocks of his erection. This task of repairing and erecting gravestones, practiced without fee or reward, was the only ostensible employment of this singular person for upward of forty years. He died at Bankhill, near Lockerbie in Dumfriesshire, on February 14, 1801, in the eighty-sixth year of his age.

"Old Mortality" had three sons, Robert, Walter, and John. The former, as has been already mentioned, lives in the village of Balmaclellan in comfortable circumstances, and is much respected by his neighbors. Walter died several years ago, leaving behind him a family now respectably situated in this point. John went to America in 1776, and, after various turns of fortune, settled at Baltimore.

FALLEN IDOLS.

A MYTH OF THE FALSE GOSPELS.

It is stated in one of those spurious Gospels, in which the love of the early Church strove to supply the hiatus left by inspiration in the history of the child Jesus, that during the flight into Egypt, in every temple by which the fugitives passed, the idols tottered on their pedestals, and then fell in shattered fragments at their bases.

ONLY an infant fair
Clinging in weakness to His mother's breast,
And in that presence rare
Smiling in conscious plenitude of rest;
Only an exile's child
By a bad monarch's persecution driven
Forth to the desert wild,
From home's dear shelter to the vault of heaven!

No herald pomp attends,
No angel cohorts chain the ravished sight,
No star its radiance lends
To lead the wanderers through the murky night;
Only a dream-warned pair,
Simply obedient to God's angel call,
Forth to the desert fare,
Nor hesitate to flee and leave their all!

Yet in the years untold
That centuries on centuries have piled,
The hoary hand of old
Hath never welcomed such puissant child,
And deep in caverned gloom,
Where Egypt's awful mysteries weave their spells,
Deep voices of the tomb
Convey his coming to the lowest hells.

Osiris on his throne
Shivered and fell before the rising sun;

Pale Isis made her moan;
The moon's cold duties to the dead were done.
While every temple fane,
Where deity with matter was defiled,
Blazed forth with light again
As passed the parents with that little Child.

Prone on their faces lay
The graven images of ancient art,
Num flashed the light of day,
And Ashor of the darkness fled apart,
While Egypt's mighty three
Dropped the usurper's scepter at his feet
In whom Heaven's Trinity
In awful yet benignant glory meet.

Only an infant fair!
Yet wheresoe'er that holy name is said,
Earth's idols melt in air,
And life succeeds the kingdom of the dead.
Before his rosy feet
Men cast the treasures of their wealth and lore;
This Victor soft and sweet
Conquers where mighty heroes failed before.

O, bear the holy Child,
Ye, who with yearning hearts would seek to win,
Polluted or defiled,
Brothers and sisters from the death of sin;
Not in the pomp and glare
Of glowing ritual or well-polished word
Lieth your answered prayer,
But in the wonder-working of the Lord.

Where greed of power and gain
Hold kneeling masses at their idol shrine,
Where lust and pleasure chain,
Where passion offers demons rites divine,
Where in the temple's fane
To beasts that perish foulest orgies be,
Thy coming is not vain
If in thy company the Christ-child be.

And we who fain would tear
From our hearts' altars every idol down,
Would purge the temple fair,
Would in the lake the legion devils drown,
If we would see them fall,
The welcomed Infant in his passing by
Will make the idols all
In shattered fragments at his feet to lie.

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE DOCTRINE OF CONDEMNATION.

THE several chief articles or points of Christian doctrine together constitute a symmetrical whole, and it seems needful that each one shall be so interpreted and construed as that the parts may be mutually harmonious. This principle applies with great force and fitness to those great theological truths that relate directly to man in his relations to the divine judgments. Here we detect, first of all, *sin*, which leads on to *condemnation;* and over against this we hear of *grace* brought in through Christ, and providing a way by which man, the confessed sinner, may stand accepted in the sight of his just and holy Judge. The justification of sinners, on the one side, touches upon the fearful facts of sin and guilt, and on the other on the blessed revelations of the divine mercy in Christ, by and through which even the sinful and condemned ones may be justified before God and crowned with eternal life. Finding man in sin detects also his separation from God, his spiritual antagonism to God's law, and his liability to the curse of death. And accordingly the Gospel is given to take away sin, and to effectuate a reconciliation between God and man, and so to save man from his sin, first by his justification before God, and, second, by the sanctification of the Spirit.

Before proceeding to inquire respecting the way by which the sinner may find grace, it may be proper to look closely into the state and condition, both legally and morally, from which he is to be delivered. And here it is evident, first of all, that the declared character of the salvation of the Gospel presumes the guilt of its intended subjects. As only the sick need the offices of the physician, so only the alienated need to be reconciled, and only the guilty to be delivered from condemnation. Much of the language of Scripture, and especially so when the subject of the salvation of sinners is considered, is forensic in its form and imagery. There is the recognized presence of a Judge proceeding according to the forms of law, and of subjects holding ascertained relations to that law, and the result of the divine inquisition must depend upon the harmony or disharmony found to exist between the law and its subjects. Wherever there is found essential harmony with the law and the subject, the law itself justifies; where this is not found, but the opposite, the law condemns, and legal condemnation implies the guilt of its subject as the necessary condition precedent. To be found out of harmony with God's righteous law, which is God's righteousness, is therefore to be guilty before God.

Guilt is in itself a fact. How the subject becomes guilty is a further point for inquiry, and since God and his law are unchangeable, the varied relations of the subject to the Judge and the law must depend upon changes in himself rather than in God. And since the divine holiness is itself the essence of that righteousness, whose active forms are at once law and judgment, whatever is not conformed to that holiness is in violation of the law, and in the divine sight, judging rightly, it is *sin*, the certain, inevitable, and immediate occasion of guilt. If the characters of any of God's moral creatures are not conformed to the pattern of his own holiness, that fact is open to his sight and his judgment must determine accordingly. And so we are told that "all are under sin," and that all men have become (are judged) "guilty before God."

The doctrine of the universal depravity of the human race is abundantly taught in the Scriptures, as it is also a patent fact in the world, and this in theological language is called *original sin*. This depraved condition of the soul St. Paul denominates "sin," and following it out to its legal result he calls that "guilt." Outward or formal acts of wrong are

the external symptoms of the deep-seated disease of the soul, the outworking of the evil intents of the inner man; and by these because men can not search the heart they judge of their fellow men. But God searches the heart, and, therefore, his judgments are always in infinite righteousness. And because he detects this abounding iniquity among men he proposes to save only the guilty and helpless.

It may be useful to pause at this point in order more fully to illustrate the subject in hand, for upon a just conception of the nature of sin will depend the estimate that must be placed on all the great doctrines of the Gospel. In terms of unusual definiteness and precision the Apostle John tells us what sin is. He does not say that it consists in overt acts of wrong, nor of wrong determinations of the volition, nor of evil desires and inclinations of the soul. These are, indeed, all of them sinful in their characters and they are also the outworkings of that which lies back of them in the fallen soul. And of that unseen but ever potentially present property of depraved man he is speaking when he declares, not that sin in action transgresses the law, but that in itself, its essential being, *sin is the transgression of the law.* The active sense of our English word "transgression" is not here to be accepted, for the original will not allow it, but it simply indicates a spirit of anarchy and of opposition to the rectoral holiness of the divine law. Essentially, sin is a condition of the soul, a regnant spirit of opposition to the divine holiness, and, therefore, it is spoken of in the singular number and is contemplated simply as a form of spiritual being. Formally and phenomenally it is multiform, and we designate it by terms of plurality. We speak of *sins* when we mean only sinful acts or practices. But in God's eyes this distinction between the actual and the essential is often not recognized, and especially so when the sin of the soul is spoken of, for the distinction is only apparent while the reality of sin is of the soul. Another of St. John's concise statements of this subject is his declaration, *All unrighteousness is sin*, where the non-active form of sin is seen in the term employed to designate it. Sin is not, indeed, a mere negation of *righteousness*, it is its spiritual opposite, so that in all moral natures in which righteousness does not predominate there sin abounds and dominates the soul. And just along this line of thought comes in the declaration of St. Paul that "the wrath of God is revealed from heaven against all unrighteousness of men." And this revelation of wrath is itself the expression of the divine estimate of the evil deserts of unrighteousness, that is, the guilt of indwelling and abounding sin in the soul; and the measure of the guilt of sin must be learned from the nature of the law of which it is the transgression.

Law is a term of the most comprehensive and expressive character. In its essential being it is all-pervading and every-where active. Thought can not wander beyond its domain, and all things that exist or of which we can have any notion are its subjects. Nor is the divine being himself without law, for though his supremacy is absolute, yet is he a law to himself, and his own immutable perfections lead him forth not capriciously, but in certain and changeless ways of righteousness. But the precepts of this universal law, though always essentially the same, will be specifically differentiated by the varieties found in the character of its subjects. In the material world it is seen in the properties of matter. In merely animal nature it appears in the forms of the vital functions and irrational instincts. But with man, because of his moral nature, it appears as moral law. In all these cases, however, the primary notion of law must still be kept in view. It is always and every-where a rule of action or a mode of existence ordained by the Supreme Authority of the universe.

In this last sense it is generally used in Holy Scripture, though even there its meaning is not always the same. It is comparatively infrequently used in its deepest and most abstract sense, because its subjects are not usually there treated abstractly. Sometimes it is applied to the law given on Sinai, and sometimes to the Levitical code. In some cases it is used as a name for the whole Bible, and sometimes for only a part of it. With St. Paul the word has two principal meanings,—first, the system of religion given to the Israelites through Moses; and second, the eternal law of righteousness revealed in the moral and spiritual lessons of the Old and New Testaments, and applied directly to men's characters and conduct as moral agents. The last evi-

dently gives a much more correct and adequate expression of the real character of the law than any other, and only by this do we come to any just appreciation of the divine government and judgments toward mankind.

But our purpose requires us to come directly to the subject in hand and to determine what really is that law of human conduct and of divine judgment by which men are to be justified or condemned. Had it a beginning, or is it eternal? Is it a divine enactment, or an essential and immutable principle of righteousness? Is it a creation, or inseparable from the mind of God? To each of these questions an affirmative answer must be given to its second member. The law is eternal, immutable, uncreated. And as such it is ineffably and transcendently glorious, and as fearful as it is sublime. Language in its loftiest forms has sought to express its nature; but only to fail most conspicuously. It has been styled a transcript of the divine mind and a declaration of the will of God. And such, no doubt, it is as it comes within the range of human thought; but a transcript is not the original, and a declaration is of the nature of a second-hand presentation. Hence we hear it said again that next to the eternal Son of God it is "the brightness of the Father's glory and the express image of his person." And even this shows us only the brightness of the glory that hides rather than displays the sacred substance. As it comes to us it is, indeed, "the *form* of God revealed," the face of God disclosed to his creatures, the original ideas of truth and righteousness which were lodged from eternity in essential Godhead, but revealed to men through the incarnation of the eternal *Logos*. "It is supreme, unchangeable reason, the unalterable rectitude, the everlasting fitness of all things that are or ever were created." In all this laboring of language to express thoughts too vast and too subtle for its grasp, along with its manifest failure, there is a shadowing intimation of the real and essential excellence that lies back of all these imperfect images, and which gives to them all their value. Only in part can the keenest intellect or the loftiest imagination take hold of a theme so transcendently glorious.

A misapprehension of this subject often arises from the mental process of distinguishing too broadly between the law of God and the divine personality, forming conceptions of them as cause and effect, legislator and enacted law. When it is said that the law is the same with the will of God there often lingers in the mind the sophism that God's will is, like man's, something originated, volitional, and conditioned, and not absolute and essentially unchangeable. We should rather consider the law of God as his *will*, finding in this expression not an action or institute of divine power; but rather God's essential character and self-hood. The divine law, as seen and known among created beings, dwells in its fullness in the divine being and essence, as a stream abides originally in the fountain, and it flows out from its source spontaneously and by the necessities of his nature, and, therefore, it possesses his own character and attributes. Since the WILL, as to its essential being, can not be separated from the personality of which it is predicated, whatever distinguishes or inheres in essential Godhead must also pertain to the law of God. This thought kept steadily in mind and properly affecting all our conceptions of the subject will aid in our speculations upon this sacred and sublime subject.

The central and eminently distinctive attribute of God is HOLINESS; and therefore the law, as the eternal efflux of uncreated goodness, is itself altogether holy. And here it must be noticed that God's holiness is not simply a negative estate, *a sinlessness*, but it is in its own nature positively and intensely opposed to whatever is unlike itself. In its essential being the divine law is forever and with infinite forcefulness opposed to *sin*. It is especially this supreme ethical property that gives to it and to all related subjects their incomparable sacredness, and which also fixes and demonstrates the ineffable vileness and ill-desert of sin. The most fearful declarations respecting the divine judgments derive their force much less from considerations of God's power and authority over us than from the exhibitions of his holiness. The highest motives to right living and being are drawn from the fact of the divine holiness; and the most fearful denunciations against sin, and against those in whom sin inheres, are based upon considerations of the ethical rectitude of the divine Law-giver, who is of "purer eyes than to behold iniquity," and in the face of sin "a con-

suming fire." The "wrath of God" is not a passion of resentment, but an eternal, unalterable, and infinitely righteous antagonism against all unrighteousnes. His vengeance, however certain or fearful, is not the venting of pent-up fury, but the steady and unvarying processes of infinite righteousness against the enemies and opposers of the law of essential holiness. It is because God is *holy* that *sinners* can not stand in his presence. The wrath of God is the natural and necessary attitude of his ethical being toward whatever is of the contrary character, and the execution of his vengeance against the evil and the unjust, against "whosoever loveth and maketh a lie," is but the outgoing of his holiness in administrative and rectoral righteousness.

Viewed in another aspect, the recognition of the divine essence as itself the substance and source of the law, detects in it the most sacred and immeasurable authority. Contemplating the divine person as the "Blessed and only Potentate—King of kings, and Lord of lords," we may the better apprehend and appreciate the rightful authority and the sacredness of all his commandments. And here, as nowhere else, we may form a proximately adequate estimate of the turpitude of sin. The wrong and guilt of transgression are measured, not by the measure of the offender, but by the character of the authority that it impugns. Offenses that may be identical with each other in all their formal conditions, on the side of the culprit, are greater or less according to the sacredness of the authority of which the violated law was the expression. The essential criminality of sin (ἀνομία—transgression of the law), in kind and degree is determined by its relation to the law of God. It is a remarkable fact in the philosophy of language that the word *sin*, by which offenses against the divine law are uniformly designated, is seldom or never used to designate any other kinds of offense. The incomparable fullness and intensity of wrong and turpitude of this supreme transgression has seemed to demand a specific and exclusive term to designate it. If, then, the extent of the criminality of sin against God is to be estimated by the sacredness of his person and the authority of his commandments, what words can describe its fearfulness, or who can estimate the weight of the curse that the divine equity must mete out against it? The Supreme Majesty of Heaven is insulted; the rectoral authority of the Ruler of the universe is contemned; the proprietary rights of the Creator are invaded; the loving-kindness of the "Father of mercies" is despised, and the holiness of the divine Person is set at naught and opposed by the corrupt lusts and the ungodly passions of depraved creatures. Such is sin, as disclosed phenomenally; but its essence lies deeper in the soul, where it subsists and dominates the whole man, as a spirit of anarchy, of selfishness, of rebellion against God, and of spiritual wickedness. In itself, sin is the reverse of the divine law, to which it stands opposed and of which it is the transgression.

This view of the subject shows very clearly and forcibly the *immutability* of the law, of which sin is the transgression, as something real and essential, and not dependent upon any possible conditions. It is not the whole truth to say of the Almighty that he "changes not;" but it must also be seen and confessed that because of the absoluteness of his perfections he *can not change*. If he is thus perfect, any conceivable change must be in the direction of imperfection; and if this could be conceived of as at all possible, then any degree of self-degradation would be possible, and so the Almighty Creator might at length become less than the meanest of his creatures, a supposition at once absurd and impious. And of course the changelessness of the Godhead necessarily implies the perpetual constancy of the law. Its spirit and its precepts, its blessings and its curses must abide forever. If the divine holiness at the beginning of the career of our race inhibited sin and denounced the curse against transgression, the same holiness must forever maintain that inhibition and that curse. If once its language was, "Cursed is every one that continueth not in all things that are written in the book of the law to do them," the same fearful denunciation must be prolonged down through the cycles of the coming ages of the Almighty. If that divine holiness decreed at the beginning that "the soul that sinneth it shall die," its voice, which can not change, must still proclaim the fearful truth that "the wages of sin is death." Heaven and earth shall pass away, but "the word of the Lord endureth forever."

Men's conception of the nature of the divine

law, and of the judgments proceeding from it, become defective by not properly considering its unity. They, indeed, recognize in it the unity of harmony, confessing that there are not contradictions among its parts, and that all its precepts are alike just and good, and in this sense they contemplate the law of God as a unit, not in itself, however, but in the agreement of its parts. But this view of the subject is both defective and mischievous. Within the sphere of finite conditions and duties the precepts of the law must necessarily be many and multiform; but all of these are but the expressions of the same eternal principle. The wrong of disobedience to the law's precepts, in any case, is detected and measured by that essential principle of righteousness which abides forever in the divine mind, and which finds expression in all of God's commandments. And accordingly no one can be at once a keeper of the law and a transgressor. Before the law there are only two well ascertained and clearly distinguished classes—they who have fulfilled its requirements and are justified by it, and they who have transgressed and so have entered into condemnation. The declaration of the Apostle James that "whosoever shall keep the whole law, yet offend in one point, he is guilty of all," though sometimes accounted a hard saying, is, however, only a truism—a necessary and direct deduction from the fact of the unity of the law; and because no degree of partial obedience and the keeping in greater or less, though not absolute, completeness its precepts can avail for justification. Only the sinless can meet its requirements and receive its approval. Such, then, are some of the properties and characteristics of the law of God, respecting which, however, it must still be confessed that "we know [only] in part;" for, doubtless, beyond our utmost reach of thought there are depths of wisdom and power that hide forever in the abyss of the eternal mind. And yet in the revelations made to us we are enabled to detect and apprehend it—holy, even as God is holy—as sacred in its right and authority as is the person of the Godhead; as immutable as the throne of the Most High; a simple and sublime unity, for God is one. And yet, respecting that law, with all its greatness and glory revealed in his own deep spiritual consciousness, the Apostle Paul declares that it is wholly inadequate to save any one of the human race, being "weak through the flesh."

By making, not God, but man the object of our inquiries and speculations, we shall be led to an intelligent apprehension of his relations to the divine judgments. Since the law of which we speak is universal and all-pervading, its authority rests upon all beings, and upon each class or kind according to its nature, and in virtue of his moral nature—his rational soul—man becomes a subject of God's moral law, as a test of his character and a rule for his conduct. Nor are we called to presume that it was by a distinct and special volition of the Creator that man was made a subject of moral law, but rather in the act of creating him "in the image of God," the Creator subjected him to that law. A new world created within the sphere of the rays of the sun would necessarily receive its light; and so the creation of man in the character then given to him subjected him to the authority of the moral law. It is man's essential nature and not its accidents nor incidental conditions that obliges him; his creation as "a living soul," and not any special enactment, covenant, or decree makes it incumbent upon him to render to God the things required of him. At first the law approved him, and pronounced him *very good;* not, however, for any thing he had done, but for what he was, a pure spirit made in "the image of God." And in the same manner the law judges us still, for we are approved or condemned according to what we are as God sees us. To each other indeed, our actions are the best indication of what we are in our interior characters, and we judge accordingly; but God looks directly into the heart and judges righteous judgment. Every soul is possessed of moral character, with the possibilities of obedience and disobedience, conformity or non-conformity to the divine pattern; and, therefore, the whole human race is judged by the law, as holy or unholy, just or unjust, and they are accordingly justified or condemned. Because "the eyes of the Lord are in all the earth, beholding the evil and the good," and "all things are plain and open to him with whom we have to do," therefore, are all men judged righteously—and they must stand or fall in the judgment according to the results of the divine scrutiny.

The approval or condemnation of each

man, in his own proper person, must be determined by his own conduct and character, as tested by the demands of the law. Do these answer to its exalted and far-reaching claims? Is man pure in heart and blameless in life? Are all things in his moral nature conformed to the divine pattern, and such that duly admeasured they must be pronounced very good? Such was man when at first he appeared a subject of the moral law. His perfect heart answered to its perfect model, and his conduct corresponded to his character. But this was only for a season. Man, made to serve and enjoy God, and created with the requisite capabilities, by the abuse of his moral powers, departed from the commandment,—became a transgressor, and a subject of sin; and so he came into condemnation, and from him, as the fountain of the race, the curse has gone forth, and all mankind are involved in the moral and judicial ruin that it entails. The seeds of sin are found in the moral nature of each individual, which are naturally and necessarily developed into inward and outward wickedness. He is "shapen in iniquity," and, therefore, his inmost nature is not conformed to the divine law, but develops from itself by natural growth both spiritual and actual sins. And because each man in his own character and life had thus become sinful, it was said on a certain notable occasion, when the divine scrutiny was made in form, that "all flesh had corrupted its way in the earth."

In the third chapter of the *Epistle to the Romans*, the inspired writer makes something like an inspection and survey of the human race, in respect to its relations to God's eternal righteousness, and has there set down the field-notes of that survey. They run in this wise:

"There is none righteous, no, not one.
There is none that understandeth, there is none that seeketh after God.
They are all gone out of the way, they are together become unprofitable; there is none that doeth good, no, not one.
Their lips are an open sepulcher: with their tongues they have used deceit; the poison of asps is under their lips.
Whose mouth is full of cursing and bitterness.
Their feet are swift to shed blood.
Destruction and misery are in their ways;
And the way of peace have they not known;
There is no fear of God before their eyes."

The conclusion to which the apostle comes, after presenting this fearful indictment,—of the truthfulness of which there can be no doubt—is certainly the only one possible. In respect to the guilty subjects it declares—"Every mouth must be stopped, and all the world must become [must be adjudged] *guilty before God;*" and in respect to the divine judgment it pronounces, "Therefore, by the deeds of the law shall no flesh [no one of the human race] be justified before God, for *by the law is the knowledge of sin*,"—applied to men's characters and lives, in every possible case, it detects sin and pronounces condemnation.

Though all this is especially and eminently matter of divine revelation, given through the written Word, yet it is not there only that it is found, but rather it is a felt and recognized presence in all the history of human thought, and in the Bible itself it is taught indirectly as fully and forcibly as in its direct doctrinal utterances. The earliest murder trial on record displays very clearly the doctrines of conscious guilt and of certain retribution. The brother's blood, then as always since, cried for vengeance, and the cry was heard, and the guilty one, self-condemned, bore the stigma of his wrong-doing, fearing in every man an avenger of his crime. The mythological Nemesis—lame, yet winged, and bearing the spear, following with tireless diligence, and infallible directness, in the tracks of the guilty ones—is much more than a fiction or a legend. It is rather an embodiment of the soul's intuition of retribution, which may seem to linger, and yet can fly upon its victim when required, and which ever bears the sword of the avenger. The Greek tragedy—that grandest production of dramatic genius—is less a creation than a transcript from the common consciousness of guilt among men, and of the certainty of retribution. The story of Cæsar's ghost pursuing his chief assassin, and that of Banquo at the feast of his murderers—the ineffaceable blood marks on the hands of Lady Macbeth, and Judas hanging himself, all come within the same category; all recognize the same abiding truth of conscious guilt and dread of its results. The hero of the tale of "Flodden Field," though he had dared to hurl defiance at "the Douglas in his hall," and even in death shouted "victory," and cheered his chieftains to the final onset, yet quailed and shuddered when he saw in the woman that bent over him to staunch his bleeding wounds, the victim of his own baseness; and with min-

gled horror and remorse, he cried out against his own faint-heartedness—

> "Curse on that fierce marauder's dart,
> And doubly curse my falling brand,
> *A guilty heart makes feeble hand.*"

But, some may ask, does not this holy and glorious law in some way contemplate and make provision for the restoration of the fallen, and the rescue of the guilty, from the curse of sin? It is, indeed, infinitely powerful, but all its strength moves the other way. It is strong to condemn and to destroy the sinful, but absolutely without strength to save them. It stands unchangeably the same, to commend and bless the righteous, and to mete out just punishment against the transgressors. Its course is steadily onward, along the lines of eternal righteousness and judgment, and it can neither be stayed nor turned aside in its progress, for it is "the eternal efflux of the divine decrees," which make no provisions by which the guilty may escape their just recompense of reward.

But, again, it may be asked, whether since the law is the substance and the expression of God's unutterable greatness, by which he works all things according to the counsels of his own will, is there not among the boundless resources of infinite goodness some way of escape for the sinner—some method by which "a man may be just with God?" May he not come with an offering—the blood of hecatombs of victims, or bringing his first-born for his transgression; the fruit of his body for the sin of his soul? All this has been abundantly answered; sacrifices are without value, and future obedience, could it be rendered, could not compensate for the past, nor take away the stain of sin, from the conscience. In proportion as the light of the Holy Spirit reveals to the spirit in man at once the divine law with its strength and its all-consuming holiness, and the soul's own sinfulness and guilt, does he become his own judge—and his awakened conscience most fearfully condemns him. He may, indeed, come to hate his sin, and earnestly desire to escape from its enthralling power, but his struggles to escape from it all the more clearly and painfully disclose his own helplessness, and the force of the law of sin that now dominates his whole spiritual being. In such a case the spontaneous groaning of the soul is heard voicing only its deep despair, "Oh wretched man that I am!" Despair alone remains, fearful and unmitigated, for God himself is against him, and all the glorious perfections of the divine character unite to pronounce his doom.

This murky cloud of sin and guilt covered our sin-cursed world, when on the evening of the day of the first transgression offended Divinity first confronted sinful man; and then and there was given that first ray from the "Sun of righteousness," which shedding its dim but cheering light down through the coming ages of sin and death, penciled upon its dark front the faint outlines of the bow of promise. Plagues deeper and darker than those let out from the fabled box of Pandora were scattered over the earth; but there was hope, nevertheless, and that dark cloud remained, through all the ages of the world's expectation, but the light that gave hope remained also, and steadily increased its radiance, as seers and sages, and priest and scribe received and appreciated the promises of the great salvation, which all desired but none could clearly apprehend. But the same light that with increasing brightness pointed the sign of hope in the heavens, also disclosed the blackness of the clouds upon which it was drawn, and from which were sent forth the lightnings and thunderings of Sinai. And so it has ever been that the way of salvation more fully displays the depth of the ruin which sin has wrought upon the soul and in the world. The promises and provisions through which salvation is revealed and made effective, for the guilty and ruined race of Adam, all recognize the greatness of that ruin, the turpitude of the guilt, and the utter hopelessness of the condition in which mankind were found. As subjects of the holy eternal and immutable law of essential righteousness, man stands a self-confessed offender, and that law is without strength to save him. But in that darkest hour, when the creation waited in mingled fear and hope, the voice of the angel at Bethlehem resolved the great secret. "For what the law could not do, in that it was weak through the flesh [not adapted to save the guilty], God, sending his own Son in the likeness of sinful flesh [by a veritable incarnation], and for a sin-offering [making atonement for sinners], condemned sin in the flesh," and so brought in the righteousness of the Gospel.

FOREIGN AFFAIRS.

THE DANGER TO ST. MARK'S, VENICE.—Of all the world's most memorable buildings St. Mark's comes in for an undisputed share. It has long been the object of universal admiration. In Italy no church has greater claims than this ecclesiastical structure, the best model extant in the work of Eastern ideas as they came to us in the crusade movement. Of course, it is not a perfect piece of workmanship in architectural forms, and owes its attractiveness rather to brilliancy of coloring and picturesqueness of effect; but as such it is what Ruskin has so well said, "a companion of delight." Action has been taken in London by the Society for the Protection of Ancient Buildings, in protest against the proposed total destruction and rebuilding of the west front of St. Mark's at Venice. A commission will sit in Venice during the present month to decide whether the work of destruction shall begin this month or be allowed to stand over for another year, and the society has resolved that a memorial be framed and signed by all lovers of art in England for presentation to the minister of public works in Italy, praying that the destruction of this, in many respects, almost unique specimen of art be not allowed to take place. Lord Houghton, Holman Hunt, and William Morris are among those who took part in the meeting. Mr. Morris has published in the *Daily News* a letter on the subject in which he says that though "this marvel of art and treasure of history" has suffered many disgraces already, it is in the main in a genuine and untouched state. He adds that whatever pretexts may be brought forward, the proposal to rebuild its front can only come from those that suppose they can renew, and by imitation make better, the workmanship of its details, hitherto supposed to be unrivaled; from "those that think there is nothing distinctive between the thoughts and expression of the thoughts of the men of the twelfth and of the nineteenth centuries; from those that prefer gilding, glitter, and blankness to the solemnity of tone and the incident that hundreds of years of wind and weather have given to the marble, always beautiful, but from the first meant to grow more beautiful by the lapse of time." In short, those only, he says, "can think the restoration of St. Mark's possible who neither know nor care that it has now become a work of art, a monument of history, and a piece of nature."

THE PARIS BOULEVARDS AT NIGHT.—Here is an inimitable word picture of these attractive streets of Paris culled from an English paper: The Boulevards are blazing. Half closing the eyes, it seems as if one saw on the right and left two rows of flaming furnaces. The shops cast floods of brilliant light half across the street and encircle the crowd in a golden dust. Diffused rays and beams, which make the gilded letters and brilliant trimmings of the façades shine as if of phosphorus, pour down on every side. The chloaks, which extended in two interminable rows, lighted from within, with their many-colored panes, resembling enormous Chinese lanterns placed on the ground, or the little transparent theaters of the Marionettes, give to the street the fantastic and child-like aspect of an Oriental fête. The numberless reflections of the glasses, the thousand luminous points shining through the branches of the trees, the inscriptions in glass gleaming on the theater fronts, the rapid motion of the innumerable carriage lights that seem like myriads of fire-flies set in motion by the wind, the purple lamps of the omnibuses, the great flaming halls opening into the street, the shops, which resemble caves of incandescent gold and silver, the hundred thousand illuminated windows, the trees that seem to be lighted, all these theatrical splendors half-concealed by the verdure which now and then allows one to see the distant illuminations and presents the spectacle in successive scenes,—all this broken light refracted, variegated, and mobile, falling in showers, gathered in torrents and scattered in stars and diamonds, produces the first time an impression of which no idea can possibly be given. There is not a shadow on the sidewalks, where one can find a pin. Every face is illuminated.

ST. MARY'S, EDINBURGH.—The revival of cathedral building, so to speak, has a noteworthy representative in St. Mary's, which

was recently consecrated with imposing ceremony in Edinburgh. Not only the Episcopal part of the community but every part of it, Presbyterian and all, contributed by its presence to the significance of the occasion. Sir Gilbert Scott considered this cathedral his best work. A romantic story is told of its origin. An old maiden lady, Miss Mary Walker, the survivor of two sisters, lived in an ancient manor house of a Scotch type, so near to Edinburgh that the spreading of the town gradually surrounded her and greatly increased the value of her property. To her wealth, which was already considerable, she added large sums by means of frugality and the rise in values. It got to be believed that she was very rich, and it was assumed that when she died some person then unknown would be made the possessor of her wealth. Some eight or nine years ago she died, and on opening her will every body in Edinburgh was astounded to hear that her entire fortune was to pass into the hands of trustees for the construction and support of a cathedral to be called St. Mary's. Notwithstanding there was a strong Presbyterian element in the Board of Trustees, the provisions of her will have been carried out with harmony and strict accuracy. The architecture of the cathedral is Gothic of the early pointed and purely English type.

LEONARDO'S "LAST SUPPER."—Among the valuable property which John Forster, the friend and biographer of Dickens, bequeathed to the South Kensington Museum were two volumes of manuscripts in the handwriting of Leonardo da Vinci, that have received from scholars scarcely any attention at all. A recent number of the London *Academy* calls attention to the great importance of these volumes, both to art and to the biography of the artist, and gives some account of what they contain. In the first of them there is detailed information of the origin of "The Last Supper," and the artist gives expression to the thoughts which influenced him in the delineations of the individual types of the apostles. On comparing these notes with the picture, one sees at a moment that Leonardo adhered to his plans in the execution of the fresco. Here are translations of several of the notes about the apostles: "One is about to drink, but leaves it (the glass) in its place, and turns his head toward the prolocutor. Another is extending the fingers of his hands, and turns toward his neighbor with a severe expression on his brow. Another opens his hands, showing their palms, and raises his shoulders toward his ears, his mouth indicating astonishment. Another speaks into the ear of his neighbor, who listens, turning toward him, and placing his ear near him, while in one hand he holds a knife and in the other the bread half-divided by the said knife. Another, in turning, with a knife in his hand, overturns with the same hand the glass which stands on the table. Another places his hands on the table, looking at his neighbor, who blows upon his mouthful (of food). Another bends forward toward the prolocutor, holding one hand over his eyes to shade them. Another draws backward (behind) the one who bends forward, and looks at the prolocutor between the wall and the sky."

PARIS SCHOOLS.—M. Herold, prefect of the Seine, recently gave at a meeting of the Paris municipal council the facts concerning the late secularization of the communal schools. Altogether, he stated, he had secularized in Paris thirty-two congregational establishments, and there remained one hundred and ten to be secularized. In the rest of the department he had secularized fifteen schools. The chief difficulty he had found was in procuring competent teachers. He said that many of the Christian Brothers had applied for masterships in the lay schools, and had been accepted. The lay teachers cost more than the congregationalists because the authorities paid them higher wages in order to get more qualified teachers. He stated that in almost every quarter freed congregationalist schools had been started by the side of the secularized schools, but in spite of this fact the number of pupils in the lay establishments continued to increase. Out of eleven thousand pupils belonging to the schools that had been secularized, seven thousand had remained there and four thousand had joined the free congregationalist schools. In conclusion M. Herold declared that the government was firmly resolved to carry out the programme of secular education, but at the same time to be prudent and not ruffle the sentiments of the people by too hasty or too sweeping transformations in the public-schools.

A ROMAN TREASURE.—Early in the morning of the 1st of June a lad engaged in repairing the drain of the house No. 23 Via dello Stelletta found a little shiny piece of metal and put it in his pocket, waiting for a chance of showing it to some connoisseur. In the mean time a good deal of the dirt from the drain was carted away in the direction of Porta Angelica. The lad had his piece examined by a goldsmith opposite, and he was just receiving twenty francs for it when the head mason and the owner of the house, who had heard somehow of the affair, came to stop the bargain at the right moment. Search was made immediately on the spot, and one hundred and forty-two gold coins were found scattered between the drain and the walls of the house. Policemen were sent after the carts; they overtook them just outside Porta Angelica, examined the contents, and found forty-two more coins, to the great amazement of the drivers, who had no idea they were removing gold from such an unexpected mine. The treasure numbers, consequently, one hundred and eighty-four gold coins of the largest size, perfectly fresh as if they had just been taken from the mint. The period to which they belong goes from 1450 to 1550, the earliest are of Pius II, the others of Innocent VIII, Alexander VI, Julius II, Leo X, Hadrian VI, Clement VII, and Paul III. Nearly one-third belongs to Clement VII, a few coins to the Viscontis and the Wladsilaws of Hungary. Some were engraved by artists worthy to vie with Donatello or Benvenuto. They are of exquisite beauty. Mgr. Casali, the owner, has been offered 36,800 francs for the group and he refuses.

WHAT BARON ROTHSCHILD DOES FOR HIS FAVORITE HORSE.—It is not the fate of many to be a Rothschild. But there is many a poor man who will envy not only the rich bankers by that name, but even the horse the Baron Rothschild, of Vienna, has come to regard as his favorite. For the accommodation of this dumb, though attractive, animal he has had a special loose box built at the cost of twelve thousand dollars. This elegant room forms a part of a new stable which cost only eighty thousand dollars. It has marble floors, encaustic tiles painted by distinguished artists, rings, chains, and drain-traps of silver, and walls frescoed with splendid hunting scenes from the pencils of eminent animal painters. Fortunately, however, the baron's annual income is $1,600,000

RUSSIA BOUND TO HAVE HER EASTERN LANDS IN COMMUNICATION.—The attempt made last Summer to divert the Amu-Darya into the Caspian with native help having failed, a commission of European engineers has been appointed to undertake the work with all the appliances of modern science. The gentlemen intrusted with the important undertaking are Herren Holmström, Bolle, Helmann, and Roop, who have just left St. Petersburg for Khiva. They will be accompanied and protected by a military force under General Ginchovski, and are expected to remain a year or two in Turkistan. Russia never abandons an idea. Saxons may have *push*, but what the Russians have is *dogged persistency*, and the question is which of the two will last longest.

WHAT PARISIANS DO FOR SUFFERERS.—There is not a more wicked spot in all the world than Paris. Indeed, the name of this place has become proverbial with all that is flippant and worthless; and yet Parisians are not so bad after all. There is humanity in every Parisian soul, and down deep in the soul there burns a love for the good, the true, and the beautiful, which the Lord has implanted and will not let die. There are the sufferers from the Mercian inundations; Paris comes to the rescue. An illustrated paper is being got up for their benefit. It will probably bring millions of francs. It promises to be the most splendid affair of its kind ever gotten up. The popular edition will be three hundred thousand copies at one franc each; but in addition there will be a special edition on Chinese paper, for which any obtainable price will be charged. Plon lends his presses to print both issues. The paper will contain *facsimiles* of the autographs of all the European sovereigns and chief statesmen. Doré, Meissonier, Worms, Neuville, and Detaille will assist with their pencils. Got contributes an article on the "Comédie Française;" Broglie writes on the "French Academy," Naquet on "Divorce," Sardou on "Materialism," and Rothschild will pen the "City Article." Victor Hugo and Gambetta are also expected to

contribute. There is hope for men while such a spirit of brotherly love continues to dwell in their hearts.

NOAH'S TOMB. — A recent traveler in the East thus writes: "A road practicable for wheeled vehicles leads along the plain to Baalbec, distant about forty miles — a pleasant road, for the first hour skirting the lower Lebanon spurs, and winding between hedges of roses in bloom and through richly cultivated country. I turned off from it before it became hot and dull, to stop at the village of Mualaka, celebrated as containing the remains of Noah, whose tomb is shown to the credulous stranger. Its dimensions are one hundred and four feet long by ten feet broad, and it conveys some idea of the size of the human race before men evolved backwards as it were to their present dimensions. As Noah lived to the age of nine hundred and fifty years, and built an ark large enough to contain specimens of every living thing on the face of the globe, there seems to be no reason why he himself should not have been one hundred feet high."

ART.

ÆSTHETIC MANAGEMENT OF CITIES.

FROM the time the immediate survivors of the deluge said, "Go to now, let us build a city," the question of city growth and city management has been one of the hardest of problems. To combine the two sometimes seemingly contradictory elements of utility and beauty is not easy. Convinced of this, the enterprising speculators in the West have first drawn out their future city on a flaming lithograph, and then proceeded to the sale of lots and the realization of their dream. The general difficulty herein discovered is the almost total lack of a high æsthetic element on the part of the projectors, and a consequent sameness and dullness in the result. The checkerboard of Philadelphia has been repeated indefinitely, and in most careless inattention to the peculiar contour of the site which is to be occupied. Doubtless by a broad and comprehensive genius a model city could be produced, such a one as would need few subsequent readjustments to answer the demands of utility and of beauty alike. But the fact is, most cities of the world, whether old or new, present a very strange conglomeration of parts, originating in individual tastes or in fancied convenience, and possess, as a whole, few artistic attractions. Many of these lacks have been supplied by either the strong arbitrary will of a sovereign, as in the case of Paris under Napoleon III, or by the boldness of great building societies, as in the case of Berlin since the Franco-Prussian war. These two cities have undergone such marvelous changes within the past twenty-five years that the old visitors to those capitals are unable to locate some of their most familiar places of resort.

But it is well known that the expense of making Paris the beautiful capital it is was something enormous. To cut remorselessly through streets and buildings, some of which had become famous and precious from historical associations, can usually be the prerogative of an arbitrary sovereign alone; and the capital necessary for such an undertaking can be supplied only by a hard tax upon the people. How much better would it be, could the planning and beautifying of our cities be under the direction and control of an intelligent and competent board of management, thus securing desirable ends without the double expense of destruction and construction! These remarks have been suggested by the reports which have appeared from time to time of the attempts to secure such a board of management for the city of Boston. In just what stage of advancement this movement is, we are unable to say; but that the enterprise itself is to be commended we think few will question. In some respects Boston is one of the most picturesque cities in America; in others she is one of the most abominably built and arranged. That she has possibilities of rich adornings and attractions none can deny who have noticed her immense water-front, looking out upon a magnificent bay, and affording many exquisitely beautiful outlooks toward the sea. Just

what may be the outcome of these efforts to improve Boston artistically can not be predicted. It is, however, probable that on this side the Atlantic our chief concern must be with the *future* of our cities. The extensions of these ought certainly to be under a professional board of control, who would carefully and persistently give direction to the arrangement of streets so as to secure the double result of beauty and convenience; and under whose absolute control should be the laying out and management of parks and squares where the tired people could find a healthy breathing place. It is devoutly to be wished that this initial movement in Boston may grow to the magnitude which its importance demands, and extend into every considerable town of this nation. When it is known that utility need not be synonymous with deformity, and that beauty is as inexpensive as ugliness, our citizens will be awake to the importance of this movement, and we shall consent to the exercise of some even arbitrary power in order to secure results so desirable.

A FRESCO OF FRA ANGELICO.

THE recent removal from what was the Chapter House of the Convent of St. Dominic, below Fiesole, of the magnificent fresco of Fra Giovanni Angelico, has revived the artistic interest in this most celebrated work of the beautiful painter. It would seem that when the ancient building was converted into a villa, the masons carelessly cracked the thin brick wall on which the painting stood, and thus was the noble fresco in danger of absolute destruction. We are happy to report that Professor Magganti has recently purchased the painting and has succeeded in bodily removing the partition without the slightest additional injury. It is truly remarkable to what injuries and mishaps the celebrated frescoes have been exposed, and how wonderfully so many of them have been preserved to our day with much of their original freshness and beauty. Fire, water, vandalism, carelessness, stupidity, change of hands, and last and not least, the passion for restoration, have followed these works like a destroying host. Only a feeling of hearty thanksgiving should be felt towards Professor Magganti for undertaking the careful guardianship of one of the first gems of the mediæval period. Charles Heath Wilson, in the *Academy*, has given to the art world some results of a recent visit to this fresco and a most careful study of the phases of history it has passed through. He claims that such results as those attained by the beatified monk clearly prove that if the principles of the revival had never triumphed, the older manner was susceptible of attaining perfection. He believes, too, that at some period this fine picture has been washed, as were the frescoes of Michael Angelo on the ceiling of the Sixtine, and with somewhat similar results. The sky has been injured by the process, most of the blue being removed; and the red now shines through portions of it, so that it seems clouded. The robe of the Virgin has greatly suffered, especially round the edges; and the ground tint, which hid the alteration of the feet of the male saints, being also partially removed, has exposed the *pintimento* in a very clumsy way. A landscape, which had been painted in distemper with the sky, has been nearly obliterated. The fresco is free from modern repainting, and any thing which to inexperienced eyes may seem suspicious is completely accounted for by the rude and foolish handling it has undergone. The cracks disturb the surface, but all the pure fresco of the great master remains intact, and the restoration of the mere *tempera* is a process at once easy and perfectly safe. The cracks may be filled up with plaster and toned with *tempera* merely to remove the disturbing effect which they produce, and which is unjust to the great work of Fra Angelico. Without touching or covering up so much as one inch of the original work, the injury inflicted by clumsy and foolish hands may be repaired as a sacred duty, and with a skill not inferior technically to the old work, while this may be done in water-color not subject to change, and which may be removed with the slightest touch of a damp sponge.

WAGNERISM—AGAIN.

WHEN will this Wagnerian battle cease? We can only say it will not while the grand captain lives to conduct the attacks and defenses. The recent utterances of Richard Wagner through the columns of the *North American Review*, to which we at the time referred, have been subjected to much adverse criticism, even by those who were friendly to much which he had defended. The arrogant

tone which was assumed in these papers must have been offensive to every truly artistic taste; and the consuming egotism therein displayed was something truly pitiable or despicable, according to the stand-point from which we study it. Specially have his unfeeling and terribly unjust estimates of some of the grand musical composers who have given to Germany an immortality of fame caused sorrow, surprise, and indignation. These can be accounted for only on one of two theories—Wagner is insane, or it is the despairing wail of a prophet who finds no response in the heart or lives of the people into whose ears he has spoken his vaticinations. To such as deny his prophetic power his utterances will appear wild through vexation, jealousy, or anger. Towards no modern musical composer has he assumed a more unjust attitude than towards Mendelssohn. When he says of his purpose, "He had no aim but to please the modern cultivated taste, and to give it occasionally, amid the shifting and turmoil of the times, the consolation of a little pleasing and elegant entertainment," it is manifest to every one who knows any thing of the life of Mendelssohn and his methods of working that Wagner is savagely unjust towards the author of "St. Paul" and "Elijah." Mendelssohn's letters to his friends abound in passages which clearly prove that he had never been subjected to so severe criticism as by himself. His attitude towards his own works affords a most curious and profitable psychological study. It is really remarkable how he could hold himself so very evenly poised, and have the judicial scales so steadily balanced while listening to the rendering of his own compositions. It can not be charged that Mendelssohn was self-assured and arrogant; nor, on the other hand, was he a cringing courtier of the public; he was earnest, fastidious, and severely just. It is, therefore, an offense to the honest and fair thinker to note in these *North American* articles this consuming egotism of Wagner, coupled, as it is, with a thorough underrating of his contemporary workers. To the German and other European musical authorities it is a matter of curious amusement to find Wagner using a transatlantic journal for his last utterances. To most of them it will doubtless appear like leaving the metropolitan press and opinion, and betaking himself to a second-class provincial authority for the sake of giving utterance to what is claimed to be a final prophecy and vindication.

SLIP BETWEEN CUP AND LIP.

THE will of the late Duke of Brunswick, which attracted so much notice at the time of his death two or three years ago, and by which he left his whole fortune, amounting to a hundred million francs or so, to the city of Geneva, where he had lived out his last years, contained a condition that Geneva should build a handsome mausoleum to his memory. This the city has done with great splendor, and the mausoleum, or monument, in the Place des Alpes, was finished only a month or two ago, at a cost of some three hundred thousand dollars. According to a description of it in the New York *World*, it is modeled upon the famous Scaliger tombs at Verona. It is a hexagonal canopy of Carrara marble, standing on a platform of red granite, and covering a sarcophagus surrounded by an iron *grille*, the sarcophagus being sculptured in relief with scenes in the history of the house of Brunswick. About it stand six ancestral statues in white marble, and the platform, girt with a balustrade of red granite, is beset with sphinxes, and lions of the same material guard the steps to it. It is covered by a gabled *flèche*, or pyramid, of red marble, a white marble angel standing in a niche on each of the six faces. This is crowned by a pedestal of white marble, on which is a bronze statue of the duke on horseback, the whole being sixty feet high. The city has spent one out of the twenty millions of dollars in its legacy in building an opera-house, of which M. Garnier, we believe, is the architect. It is built in the manner of the Grand Opera-house at Paris, and is behind only that and its rival at Vienna in magnificence. The Canton of Geneva naturally wished to share in this good luck, but the city refused to divide the inheritance; and so, although it has been a custom to remit the cantonal tax of two and one-half per cent on legacies left for public uses, the canton insisted this time on its right to the duty, and the city has had to pay two millions and a half of francs for the privilege of using the remainder. The opera-house was to have been opened this season, and was finished a month ago, it is said. Now that all this is done, that the

money is spent on the opera-house and the mausoleum, and the succession-tax is paid, the city is told that the duke's heirs have succeeded in breaking the will, on the ground that the duke, having been interdicted from reigning, and proclaimed by the courts a spendthrift incapable of managing his property, was disqualified from disposing of it by will. Therefore, the will is declared void by the tribunal of Brunswick, and the estate may be expected to revert to the duke's natural heirs. The city of Geneva, however, is wealthy, as well as thrifty. She has got her opera-house, and undoubtedly is able to pay for it, little as she may like to. The succession-tax may yet be recovered, and she has at least the satisfaction, such as it is, which not all cities can claim, of having done handsomely in her memorial by a man who tried to do handsomely by her.—*American Architect.*

CHARACTERISTICS OF BEETHOVEN.

GROVE'S new Dictionary of Music brings out many of the peculiar characteristics of Beethoven. We are told, among other things, that Beethoven went nowhere without his sketch-books, and, indeed, these seem to distinguish him from other composers almost as much as his music does. They are, perhaps, the most remarkable relic that any artist or literary man has left behind him. They afford the most precious insight into Beethoven's method of composition. They not only show, what we know from his own admission, that he was in the habit of working at three and even four things at once, but without them we should never realize how extremely slow and tentative he was in composing. Audacious and impassioned beyond every one in extemporizing, the moment he takes his pen in hand he becomes the most cautious and hesitating of men. It almost would seem as if this great genius never saw his work as a whole until it actually approached completion. It grew like a plant or a tree, and one thing produced another. . . . There is hardly a bar in his music of which it may not be said with confidence that it has been rewritten a dozen times.

NATURE.

A NEW THEORY OF SEASICKNESS.—The singular benefit derived by the use of nitrite of amyl in seasickness has suggested a new theory of the cause of the malady, namely, that it is due to cerebral anæmia. The proposer, Henry Naylor, Edinburgh, says: "The rapid swinging of the vessel and the body with it irritates the eyes and vision, and this, by reflex action, produces a spasm of the cerebral capillaries; this explains the feeling of faintness and giddiness that comes on suddenly just as the vessel gives a lurch. The sudden emptying of the cerebral vessels causes the stomach to sympathize, resulting in nausea, whether the stomach be full or empty. These symptoms are most distressing when the subject is sitting or standing, with the eyes open. If he lies down the change of position relieves the anæmia, the faintness or dizziness pass off, and the sickness ceases. But occasionally even the recumbent position does not give relief if the eyes are kept open. I have known this to be the case with several ladies who were never comfortable at sea unless lying down with eyes closed. They were able to eat their meals if they lay down with closed eyes immediately after. A fact that helps to show the feasibility of the anæmic theory is that brandy and other stimulants give considerable relief for a time, which would not be the case in cerebral congestion, which has been supposed to be the cause hitherto. The explanation of how seasickness continues so persistently in some is that the sickness weakens the heart's action, and this diminishes the flow of blood to the brain; so that prolonged seasickness is due to a circuit of causes, visual irritation, cerebral anæmia, sickness, weak heart action." Mr. Naylor adds that amyl nitrite usually does good in seasickness if used at once, because, being an anti-spasmodic, it relieves the spasm of the cerebral vessels, and thus the brain is refilled with blood. But if it fails then the persistent sickness, by its effect upon the contractions of the heart, prevents the brain from getting a sufficient supply of blood, and the

brain becomes anæmic, not from a spasm of the capillaries, but from an insufficient power of the heart. It is at this stage that alcholic stimulants in small doses, frequently repeated, give great relief.

SIMULATION OF DEATH BY INSECTS.—In an interesting paper read before the Entomological Society of England the simulation of death so frequently observed among insects was regarded not as an intentional stratagem to escape danger; but as a species of catalepsy due to terror, and was compared to the so-called fascination which certain birds and small mammals experience in the presence of a snake. It would seem that the tendency to such simulation in different species is inversely as their locomotive powers. Thus, as far as the true insects are concerned, shamming death is most common among the coleoptera, the order whose locomotive faculties are, upon the whole, lowest. Looking again at the group of coleoptera, we find the tendency to simulate death absent, or at least very rare, among the tiger beetles, scarabs, and the geodephaga generally; among the long-horns, which, when alarmed, rise in the air almost as readily as do bees or diptera; among the staphylini, which both fly and run, and among the elateridæ, which escape danger by a sudden leap. On the other hand, the semblance of death is often put on by the lamellicornes, which are slow crawlers, blundering flyers, and are incapable of taking wing without some time for preparation. All these properties are still more decided in the genus *Byrrhus*, and here, accordingly, we find simulation at its height. At the mere sound or vibration caused by an approaching footstep, human or brute, one of the latter insects draws in its legs and assumes very effectively the appearance of a small stone or rounded clod of earth. Among spiders the same distinction may be traced. The slower and more sedentary forms, if in the presence of an enemy, roll themselves up in a ball and may easily be passed unobserved. On the contrary the wandering ground spiders, which in warm weather bound with such rapidity that they are sometimes by careless observers supposed to fly, rarely resort to this strategem except when very persistently teased and intercepted.

SEA-WEEDS AS FOOD.—In a recent speech on the trade between Japan and Hong Kong, the English governor of the latter port made statements with regard to the use of sea-weeds in China, which suggest the possibility of our neglecting a valuable source of food supply along our Atlantic coast. The profitable crop of "Irish" moss gathered annually from the rocks off Scituate, Massachusetts, may be but a small part of our resources in this direction. The governor observed that he had been examining the Japanese sea-weeds and it seemed to him that he recognized familiar friends. In the busiest streets of Hong Kong similar products are to to be seen in bales and bundles with Japanese trade-marks upon them. These sea-weeds have a high reputation in China for their succulence and nourishing qualities. From the statistical tables it is found that in the year ending June 30, 1878, the quantity of Japanese sea-weeds received in China through Hong Kong and otherwise, amounted to 20,565,479 catties, valued at $456,366.

Looking at the way this article of food is produced and put upon the Chinese market, and to the extraordinary demand for it in that empire of four hundred millions of food-consumers, it is not too much to say that its production and sale will be in direct ratio to the labor devoted to it. Increase that labor fivefold and the consumption of sea-weed will probably increase fivefold. The governor further states that after having experienced the new and not unpleasant sensation in eating some well-cooked sea-weeds he was not surprised at the estimation in which the Chinese, a nation of cooks and gourmands, hold them.

HOW ICE BOATS SAIL FASTER THAN THE WIND THAT DRIVES THEM.—It is demonstrated in mechanics that when a force acts continuously on a movable body the motion of this body increases every moment. In the case under consideration the force is the wind, the movable body is the ice yacht. The force is continuous, supposing the wind continues to blow; therefore, the ice yacht should go faster and faster, and if it be a sufficient time in motion its velocity will at a given time exceed that of the wind. In this reasoning it is supposed that the friction of the yacht on the ice is sufficiently small not entirely to destroy the increase of speed which the wind tends to communicate to the boat. It must be observed that the velocity of the wind may vary during

its action, though this by no means weakens our proof. It is sufficient that it acts continuously. If the constant force vary in intensity, the increase of speed will be less each moment, but the velocity will, notwithstanding, increase, supposing always that it is not annulled by friction. Let it be observed, in fine, that it is quite possible for a boat to go faster than the wind which drives it. For this it suffices that the boat, during the whole time of its course, moves through air already put in motion by the same wind.

THE PHILOSOPHY OF BLOWING OUT A CANDLE.—If we blow a fire it burns more fiercely, but if we blow a candle it goes out. These two facts if taken together are a familiar illustration of the influence of temperature on chemical affinity. In both cases, that of the fire and that of the candle, the burning is the combining of the oxygen of the air with the carbon and hydrogen contained in the coal or wood of the fire, or in the tallow of the candle. Now cold carbon and hydrogen may lie in contact with oxygen for any length of time without combining with either; but if the substances be made red hot they instantly enter into chemical combination. When a candle is burning the heat generated by the combustion constantly raises new quantities of the material to the temperature at which combination with oxygen will take place, and thus the combustion is kept up. But if a current of air of a temperature far below the combustion point be thrown against the flame, the hot vapors are swept away, and others which are rising in their place are cooled so that combination with oxygen no longer takes place; in other words, the candle ceases to burn. On the other hand, when we blow a large fire, the mass of combustion is so great that, instead of the carbon and hydrogen being cooled, the oxygen of the blast is heated, and the combination is made thereby more active; in other words, the fire burns more fiercely.

ELECTRICAL CAMPHOR.—If a small bit of camphor is laid upon water it begins turning and moving about with great rapidity. If a few grains of lycopodium or other light powder have been previously scattered on the water they are drawn toward the camphor in eddies in an inverse direction. These phenomena were observed in 1748 by Romieu, who attributed them to a difference of electricity between the water and the camphor. Subsequent investigators thought they might be due to the camphor vapor striking the water and producing a recoil. M. Cassamajor has, says *Les Mondes*, resumed the study of the question and adopted the views of Romieu. He instances the following crucial experiment: At the same time that the bits of camphor are thrown upon the water insert a glass rod which has been rubbed with flannel; the motion immediately stops. If the electricity is removed from the rod by rubbing it with tinfoil, it loses its power of checking the eddies.

HOTTEST CLIMATE IN THE WORLD. — The hottest climate in the world probably occurs in the desert interior of Australia. Captain Sturt hung a thermometer on a tree shaded both from sun and wind. It was graded to 127° Fahrenheit, yet so great was the heat of the air that the mercury rose till it burst the tube, so the temperature must have been at least 128° Fahrenheit, apparently the highest ever recorded in any part of the world. For three months Captain Sturt found the mean temperature to be 101° Fahrenheit in the shade. Nevertheless, in the southern mountains and table-lands three feet of snow sometimes falls in a day; in 1876 a man was lost in the snow on the borders of New South Wales. Snow-storms have been known to last three weeks, the snow lying from four to fifteen feet in depth, burying the cattle.

HEADLESS BUTTERFLY LAYING EGGS. — A correspondent of a scientific journal relates the following curious circumstance: Not long ago I picked up a butterfly, probably belonging to the genus *Vanessa*. It was a female, the head of which had recently been plucked off by a bird and was lying near the body. Thinking it was dead I carried it home to examine the wing scales. On clipping off a bit of wing about four hours afterward, the legs moved, and in a short time an egg was laid. Others followed until twenty-five had been deposited. The laying ceased, and the headless mother seemed indeed dead. Next morning on touching her the motions of the legs and wings were repeated, and soon the laying was resumed. On close examination a heaving of the wings and rings of the abdomen could be observed,

with about the frequency of human breathing. At the end of twenty-nine and a half hours from the time of finding, the laying ceased; seventy-eight eggs having by that time been laid by the butterfly with her head off.

NEW LIFE-SAVING APPARATUS. — A new apparatus has at last been invented for the saving of life at sea which promises to be a perfect success. It is only a belt, but is, according to the result of the different tests to which it has been subjected, a most "clever" invention, as an Englishman would say. The inventor is an Englishman, the Board of Trade Surveyor at Southampton. The most searching trial the life belt had was from a body of English shipping merchants, and they gave emphasis to their indorsement by an immediate adoption of this saving apparatus on the ships they control. Ocean accidents have not lessened since the introduction of steam, and the invention of an apparatus that may serve in an emergency at sea is a great boon to humanity. We hope this belt will prove the long-looked-for salver. Its construction is very simple indeed. It consists of small air-tight copper vessels, which are so influenced by a concealed brass spring as to cause it to encircle the body, and by an ingenious and simple contrivance it becomes attached firmly, yet comfortably to the person. There are no straps or tapes required, and its application is instantaneous. It possesses a buoyancy of forty pounds and its design allows of its stowage in a great variety of ways and places on board any vessel, so that it can be always accessible.

THE SIZE OF OUR GREAT LAKES. — The latest measurements of our fresh water seas are as follows: The greatest length of Lake Superior is 335 miles; its greatest breadth is 160 miles; mean depth, 688 feet; elevation, 627 feet; area, 82,000 square miles. The greatest length of Lake Michigan is 300 miles; its greatest breadth, 108 miles; mean depth, 690 feet; elevation, 506 feet; area, 23,000 square miles. The greatest length of Lake Huron is 250 miles; its greatest breadth, 169 miles; mean depth, 600 feet; elevation, 274 feet; area, 20,000 square miles. The greatest length of Lake Erie is 250 miles; greatest breadth, 80 miles; mean depth, 84 feet; elevation, 555 feet; area, 6,000 square miles. The greatest length of Lake Ontario is 180 miles; its greatest breadth, 65 miles; mean depth 500 feet; elevation, 261 feet; area, 6,000 square miles. The length of all five 1,265 miles, covering an area upward of 135,000 square miles.

A NEW THEORY OF DEW.—Professor Stockbridge, of the Amherst Agricultural College, has been making some experiments as to the origin of dew, and has arrived at conclusions somewhat different from those generally accepted. It is usually held that dew is the moisture of the air condensed through contact with objects of a lower temperature, and that it does not form till radiation has reduced the temperature of the earth. Professor Stockbridge asserts, however that dew is the result of condensation by the air of warm vapor which rises from the soil. And he embodies the result of his experiments in these propositions: 1. The vapor of the soil is much warmer at night than the air, and could be condensed by it. 2. Vapor from the soil is soon diffused and equalized in the whole atmosphere, but in the largest proportion when evaporation is taking place near the surface of the soil, and other things being equal, plants nearest the earth have the most dew. 3. Dew under haycocks, boards and like objects on the ground could receive it from no other source.

A GOOD KEROSENE.—According to Professor J. Lawrence Smith good kerosene should have the following characteristics: 1. The color should be white or light yellow, with a blue reflection. 2. The odor should be faint and not disagreeable. 3. The specific gravity, at 60° Fahrenheit, ought not to be below .795 nor above .84. 4. When mixed with an equal volume of sulphuric acid of the density of 1.53, the color ought not to become darker, but lighter. A petroleum that satisfies all these conditions, and possesses the proper flashing-point, may be regarded as pure and safe.

RELIEF OF COLOR BLINDNESS. — M. Delbœuf has found that if a person afflicted with color blindness looks through a layer of fuchsine in solution his infirmity disappears. A practical application of this discovery has been made by interposing between two glasses a thin layer of gelatine, previously tinted with fuchsine. By regarding objects through such a medium all the difficulties of color blindness are said to be corrected.

WHAT LIGHTNING CAN DO TO A WATCH.—Last Summer a lady who carried a valuable gold watch was in a house in Madrid, Maine, when it was struck by lightning. The watch stopped at the time, and although jewelers have repeatedly examined it and pronounced it perfect in every particular, it can not be made to move. It is so magnetized that watch-makers say no part of it could ever be made to do duty if taken out and put into another set of works.

STRAW WOOD.—An inventor in Illinois has introduced a very important invention in the building trade by the substitution of straw as a building material. America is beginning to feel the strain which is continually being made upon her forests, extensive as they are, and this new material has already attracted much attention. Several sheets of straw-board such as is produced in a paper-mill are taken, according to the thickness of the desired block, and are then passed through a chemical solution which softens the fiber and saturates it. They are then rolled, dried, and hardened, and emerge from the machine as a compact block, hard, impervious to water and capable of taking any polish, such as of walnut-wood or mahogany. In fact, on sawing it, it is very difficult to distinguish it from real wood.

STRAW BARRELS.—A still further application of straw is reported from San Francisco, which will largely affect the cooperage trade. Straw pulp is made by pressure in a machine into the form of barrels and kegs, which, with their wooden hoops, weigh only about sixteen pounds each.

RELIGIOUS.

TOO MUCH PROPHECY.—No one thing has more tended to throw discredit on the evidential value of prophecy than the wide-spread writings of a particular school who have employed it for the purpose of prying into the future, especially in attempting to determine the time of the advent of our Lord, and the circumstances with which it will be attended. To these the books of Daniel and Revelation have furnished a mass of material which have afforded an opportunity for an inexhaustible play of the imagination. Prophecy in their hands stands in much the same relation to sound exegesis as historical novels do to genuine history. Again and again have the most confident predictions been put forth fixing the date of the second advent, but which have been falsified by the arrival of the appointed time. Even Napoleon III has found a place in their lucubrations, but instead of acting the part assigned to him he is quietly sleeping in his grave. Nothing, however, daunts this class of writers. Let their predictions be falsified by facts ever so often, yet they invariably rally their forces. When they fix a time for our Lord's second coming, and he comes not, they then discover that the prophetic Scriptures admit of its being deferred to some more distant period, when it is improbable that the writer will be alive to be convicted a second time of being a false prophet. It is not to be expected that doubters and unbelievers will attach much weight to the evidence of prophecy, when the argument is persistently handled in popular literature in such a manner that it makes even devout believers shrink from the entire subject.

ONEIDA COMMUNITY'S NEW DEPARTURE.—The orthodox fight against these communists has, after all, proved to have been for a purpose. There are croakers all over the country who pretend that a square fight with dishonesty and corruption is of no avail, and that we are too far gone ever to recover again; and yet here are the Oneida Communists, for years given over to complex marriage, and the clergy of the Church catholic rises up and says this ought not so to be, and it is undone; and finally the word goes out from the powers that be at the community near Oneida, that on and after August 28, 1879, complex marriage shall no longer be valid within their jurisdiction; and one of the most objectionable features in the faith and practice of a body claiming Christian fellowship is defunct in the twinkling of an eye and only because public opinion has been aroused and the thing can not be

tolerated any longer. So much for the strength of public opinion!

ECUMENICAL METHODISM. — The General Conference of the Methodist Episcopal Church, in session in Baltimore in May, 1876, adopted a series of resolutions proposing an ecumenical conference of Methodism, and appointed a committee to further the design of the General Conference by correspondence and otherwise. This committee laid the matter of the proposed ecumenical conference before the representative bodies of the Methodist Protestant Church, the Methodist Episcopal Church South, the American Wesleyan Church and the Evangelical Association of the United States; also before the representative bodies of the Methodist Church, and the Methodist Episcopal Church of Canada, and the Wesleyan Methodists of Great Britain. Every one of these representative assemblies has taken action in favor of an ecumenical conference of Methodism, and has appointed a committee, or provided for its appointment, to act in this business, and for the furtherance of the objects stated. It is now proposed to have a joint meeting of these committees or of their chairmen, or of some one or more persons authorized to act in their stead, to prepare a call for such ecumenical conference, determining the time and place of meeting, suggesting a basis of representation and providing for essential preliminary details. This joint meeting will be held in Cincinnati during the session of the next General Conference; and the committee above referred to express their earnest desire that it may be attended on Thursday, May 6th, not only by the representatives of the several Methodist bodies which have taken action in favor of an ecumenical conference, but also, as far as practicable, by authorized representatives of all other Methodist organizations in every part of the world.

CHURCH OBJECTIONS.—We copy the following sensible words from the *Church Helper*:

"It is one of the strangest disclosures of human strangeness that there should be brought to light persons who regard *less* their engagements and agreements with the Church than they do those which they make in the common business of life. Yet in almost every Church under the sun such persons are found. Persons they are who would scorn to break covenant in a secular agreement. Their conscience would not let them do it. Yet they can break an engagement to walk with their Church, to share in its meetings, responsibilities, burdens, and ordinances, apparently without a single compunction of conscience. They can even neglect altogether the agreement thus made, for months or years, perhaps, with utter seeming indifference as to the fact that they are breaking a sacred covenant and violating their word. The reader of this has possibly known some who carried this moral indifference as to failures towards the Church so far that an honest *debt* contracted in its behalf is regarded by them as, in fact, far less binding than one owed in a business interest, or even as not binding at all. How is it that any can have one conscience in their secular matters, and such another conscience as related to the Church? Blessed is that Church member who has a good conscience towards all his covenants!"

THE BIBLE ABROAD.—The issues of the British and Foreign Bible Society, for the last fiscal year, were 3,340,995 volumes, showing an increase over the previous year of 397,398 volumes. As an indication of the importance of the foreign work of this Society, we note that of the 3,340,995 volumes issued during the past year, 970,071 were in English, and 2,370,924 in foreign tongues. The aggregate issues of this Society, for the 75 years of its existence, are 85,388,057 copies, in 230 languages and dialects. The following outline of the Society's foreign work of distribution the past year shows the various countries and languages in which it has taken place: In France, 434,815 copies; Belgium, 14,444; Holland, 40,490; Germany, 353,786; Austria, 290,900; Spain, 54,185; Denmark, Sweden, Norway, 171,860; Russia, Northern, 253,283; Russia, Southern, 161,116; Turkey, 39,352; Poland, 27,596; Servia, Roumania, Bulgaria, 132,642; Italy, 50,905; Portugal, 9,193; Greece, 2,242; Syria and Palestine, 1,908; Egypt, 2,759; Madagascar, 14,172; India, 177,621; Ceylon, 6,280; Africa, 28,925; South America, 10,641.

PROTESTANT TURKEY.—American Protestants have furnished the Turkish Empire with four excellent colleges: Robert College at Constantinople, the Syrian College at Beyroot, the Central Turkey College at Aintab, and th American College at Harpoot, two of which

are independent of missionary control, but all of which co-operate with the missions and receive missionary co-operation. During ten years fifty-nine students have been graduated from the college at Beyroot, of whom four are engaged in the college, ten are practicing medicine where good doctors are needed, two are druggists, eleven are studying medicine, and eighteen are missionary teachers, preachers, translators, etc. Forty-six have been graduated from the medical department, and five from the pharmaceutical department, and are helping build up the reputation of the college in distant parts of the empire. An alumni association was formed on the occasion of the tenth anniversary of the college with much enthusiasm and many expressions of affection for their *alma mater* on the part of the graduates. Not all of these former students are professed Christians, but they owe all that they are to Christian culture, and they know it; and their employers know it, too.

LARGE CONFERENCES.—The Genesee Conference is, numerically, the largest in American Methodism. Its roll embraces three hundred and twenty-three itinerant preachers, and a lay membership of about thirty-five thousand Church members, six thousand Sunday-school officers and teachers, and over thirty-six thousand Sunday-school scholars.

GROWTH OF LUTHERANISM.—The Lutherans have in the United States about three thousand one hundred and fifty ministers, five thousand six hundred congregations, and seven hundred and twenty-five thousand communicants. They are increasing largely from the large German and Scandinavian immigration.

RELIGIOUS MISCELLANY.—The Rev. Samuel West, a local preacher of the Methodist Episcopal Church, who celebrated his hundredth anniversary February 14, 1879, died recently at Olive Branch, Ohio.

— The Wesleyan Methodist Church of Ireland has decided to raise, for the benefit of education and home and foreign missions, one hundred thousand dollars, to be called, "The Thanksgiving Fund."

— In Holland there are two million members of the Reformed Church, seventy thousand Lutherans, forty-two thousand Mennonites, six thousand Remonstrants or Arminians, four hundred Moravians, and eighty thousand Separatists, or Old Reformed.

— The General Synod of the State Church of Prussia passed resolutions condemnatory of mixed schools and government examination of theological candidates. The majority expressed condemnatory views of Falk's policy. And why should they not? The Prussian clergy is like every other state clergy, too greatly interested in its "livings" to care much for the souls of their parishioners. Education controlled by the state means thorough work, and that such ecclesiastics are not capable of.

— A "preaching match" is announced to take place in Dalry, Scotland. Two preachers are to contend for the favorable verdict of the citizens on a stage erected in the public hall. Whether both are to preach from the same text is not stated. Walking matches having had their run in this country, would n't some ingenious Yankee try this kind of experiment this side the Atlantic?

— The government of Austria, in response to the petition presented by a deputation of the Evangelical Alliance, has finally relented of past misdeeds. It has issued an order removing the disabilities under which Protestant missions have been laboring in Bohemia, and has granted the rights and privileges asked for. Now let us see what Protestantism will do for Bohemia and other Austrian provinces, alas so long under popish influence and domination.

— Three members of the organization known in England as the "Salvation Army," have come to this country and begun to hold services in Philadelphia. Their meetings are largely attended, and numerous conversions are reported. They expect re-enforcements from England.

— The Samoan Islands have finally been entirely Christianized. Out of a population of about forty thousand some thirty-five thousand, or seven-eighths, are connected with Christian Churches. The London Missionary Society reports 26,493; the Wesleyans, 4,794; the Roman Catholics, 2,852. But what about the Mormons having gained 126 also? What a pity these people should count upon protection as American citizens, and make converts among savages to whom the bread of life is a much needed boon.

CURIOUS AND USEFUL.

A DAY WITH JOHN BROWN.—A pretty good account has very recently been given in England of this good man, and we think it worth while to reproduce it here: "During the day he staid with me in Lawrence I had my first good opportunity to judge the old man's character. I had seen him in his camp, had seen him in the field, and he was always an enigma, a strange compound of enthusiasm and cold, methodic stolidity — a volcano beneath a mountain of snow. He told me of his experiences as a wool-merchant and manufacturer in Ohio, and of his travels in Europe. I soon discovered that his tastes ran in a military rather than a commercial channel. He had visited many of the fortifications in Europe, and criticized them sharply, holding that the modern system of warfare did away with them, and that a well-armed, brave soldier was the best fortification. He criticised all the arms then in use, and showed me a fine specimen of repeating rifle which had long range sights, and, he said, would carry eight hundred yards; but, he added, the way to fight was to press to close quarters. He had two small pamphlets or circulars, one he had had printed on the armies and military systems of Europe; the other was addressed to the soldiers of the United States army, and was an odd mixture of advice as to discipline and soldierly habits, and wound up by advising them to desert whenever there was an attempt made to use them against a free government and human liberty. He looked upon passing political movements as mere preliminaries or adjuncts to more important events in the future. With him men were nothing, principles every thing. In his ordinary moods the man seemed so rigid, stern, and unimpressible when I first knew him that I never thought a poetic and impulsive nature lay behind that cold exterior. The whispering of the wind on the prairie was full of voices to him, and the stars as they shone in the firmament of God seemed to inspire him. 'How admirable is the symmetry of the heavens; how grand and beautiful! Every thing moves in sublime harmony in the government of God. Not so with us poor creatures. If one star is more brilliant than others it is continually shooting in some erratic way into space.' One of the most interesting things in his conversation that night, and one that marked him as a theorist (and, perhaps, to some extent he might be styled a visionary), was his treatment of our forms of social and political life. He thought society ought to be organized on a less selfish basis; for while material interests gained something by the deification of pure selfishness, man and woman lost much by it. He said that all great reforms like the Christian religion were based on broad, generous, self-sacrificing principles. He condemned the sale of land as a chattel, and thought that there were an infinite number of wrongs to right before society would be what it should be, but that in his country slavery was the 'sum of all villainies,' and its abolition the first essential work. If the American people did not take courage and end it speedily, human freedom and republican liberty would soon be empty names in the United States."

THE FLAVOR OF ANIMAL FOOD IS VARIABLE.—A notable fact in relation to the peculiar food giving a flavor to the flesh of animals, such as muddy weeds to that of fish, fish to wild ducks, acorns to the flesh of pork, and many other instances, is most remarkable in the case of parrots. We are assured by those who, living in South Africa, have frequently eaten of parrots, that the delicacy of the flesh varies from a luxury to positive rejection during certain seasons of the year. When the delicious guava is ripe they are sapid and fat; the seed of the acajon imparts a slight and not disagreeable *soupçon* of garlic; spicy seeds give not only the flavor but an aroma of cinnamon, cloves, etc., and all berries give a peculiar quality to their flesh. They are, moreover, wine-bibbers. We had a parrot which had contracted that habit at the passengers' dinner-table on board one of the Peninsular and Oriental steamers. He would watch the guests retire, and go round and "heel-tap" every glass as dry as any servant-man. The seed of the cotton tree is the parrot's especial weakness, and will intoxicate it in the same

manner as alcohol does man. Dealers are said to be giving parrots a like stimulant previous to showing them to a customer, as it has the effect of making them loquacious.

A HALF-BOOT.—A pretty good story is told of the great English statesman and orator, Lord Brougham, the man who in himself gathered the history of his times. This anecdote tells of one of Brougham's earliest appearances as an advocate. It was in behalf of a man who was accused of stealing a pair of boots. The evidence as to the theft was conclusive, but Brougham contended that his client must be acquitted, the articles stolen being half-boots, which, he argued, were not boots any more than a half-guinea was a guinea, or half a loaf a whole one. Lord Eskgrove, knowing his man, guessed that he was being played upon, so without asking the prosecuting counsel to reply, he at once overruled the objection, saying, "I am of opinion that 'boot' is a *nomen generale*, comprehending a half-boot. The moon is always the moon, although sometimes she is a half-moon."

NEW METHOD FOR PRESERVING THE DEAD.—Our consul-general at Berlin reports a German invention for preserving the dead. In three thousand grammes of boiling water there are dissolved one hundred grammes of alum, twenty-five grammes of cooking salt, twelve grammes of saltpeter, sixty grammes of potash, and ten grammes of arsenic acid. When the mixture is cool it is filtered, and to every ten litres of it four litres of glycerine and one of methylic alcohol are added. Bodies saturated and impregnated with this liquid are said to resist decomposition very well.

THE DERIVATION OF THE WORD MONEY.—The derivation of the words relating to money and commerce is interesting and instructive. "Pecuniary" takes us back to the times when value was reckoned by so many head of cattle. The word "money" is from *moneta*, because in Rome coins were first regularly struck in the temple of Juno Moneta, which again was derived from *Monere*, to warn, because it was built on the spot where Manlius heard the Gauls approaching to the attack of the city. "Coin" is probably from the Latin *cuneus*, a die or stamp. Many coins are merely so-called from their weight, as, for instance, our pound, the French livre, Italian lira; others from the metal, as the "aureus," the "rupee" from the Sanskrit "rupya," silver; others from the design, as the angel, the testson from *teste* or *tête*, a head; others from the head of the state, as the sovereign, crown; others from the proper name of the monarch, such as the daric, from Darius, the philip, louis-d'or, or the napoleon. The dollar or thaler is short for the Joachimsthaler, or money of the Joachim's valley in Bohemia, where these coins were first struck in the sixteenth century. Guineas were called after the country from which the gold was obtained, and the "franc" is an abbreviation of the inscription *Francorum Rex*. The "sou" is from the Latin *Solidus*. The word shilling appears to be derived from a root signifying to divide; and in several cases the name indicates the fraction of some larger coin, as the denarius, half-penny, farthing, cent, and mill. The pound was originally not a coin, but a weight, and comes from the Latin *pondus*. Our pound was originally a pound of silver, which was divided into two hundred and forty pennies. The origin of the word penny is unknown. Some have derived it from *pendo*, to weigh; but this does not seem very satisfactory. Our word "sterling" is said to go back to the time of the Conquest, but the derivation has been much disputed. Some have supposed that it was first attributed to coins struck at Stirling, but for this there is not the slightest evidence; others that the name was derived from coins having a star on the obverse, but no coins which could have given rise to such a name are known. The most probable suggestion is that it has reference to the Easterling, or North German merchants.

WONDERFUL CURES.—Sir Humphrey Davy was once tempted into playing a practical joke by way of testing the curative power of the imagination. When the properties of nitrous oxide were discovered, Dr. Beddoes, jumping to a conclusion that it must be a specific for paralysis, chose a subject upon whom to try it, and Sir Humphry consented to administer the gas. Before doing so, Davy desiring to note the degree of animal temperature, placed a small thermometer under the paralytic's tongue. Thanks to Dr. Beddoes, the poor fellow felt sure of being cured by the new process,

although utterly in the dark as to the nature of it. Fancying that the thermometer was the magical instrument which was to make a new man of him, he no sooner felt it under his tongue than he declared that it acted like a charm throughout his body. Sir Humphrey wickedly accepted the cue, and day after day for a fortnight went through the same simple ceremony, when he was able conscientiously to pronounce the patient cured. M. Volcipelli, a Roman physician, played a similar trick upon some of his hospital patients, who were greatly affected whenever powerful magnets were brought near them. Placing them under exactly the same conditions to all appearances, but taking particular care to exclude magnetic influence, he found that every one of them was disturbed in the same degree as when the magnets were actually employed.

Sleepy Hollow, that last resting-place of our immortal and inimitable Washington Irving, is soon to be filled with the racket and cinders of passing railway trains. The visitor whose heart has been drawn towards the loveliest haunts of America's greatest prose writer has been able to stroll from the river bank at "Sunnyside," to glance at the Episcopal church where the funeral services were held, to stop at the sexton's house and see the time-worn communion service, to cross the Headless Horseman's bridge, to linger beside the mill and the quaint Dutch church, to listen to the creaking of the aspens and willows in Sleepy Hollow, and finally to read the very simplest inscription recorded upon any of its tombstones, marking by its simplicity the most famous grave in the cemetery, and at the same time to breathe the very atmosphere of somnolent quietude which invested this whole region with its character and name. There is to be a new steam railway to run from High Bridge to Brewster's, which will traverse Sleepy Hollow, and already the historic mill along that roadside has been made to do duty in this new enterprise by turning out ties for the road-bed.

The Discipline of Education.—We are convinced that the requirements of the schools, the mental training which comes of a study of the ancient languages and the higher mathematics are far from being so completely disciplinary as the ordinary experiences of the professions and the trades. The lawyer in his practice soon gains the power of concentration, and is fairly compelled to bring his mind under the control of his will, his discipline being more thorough, more exacting, more sustained than any that can be invented by college systems. The daily experience of the physician is likewise sufficient in bringing all the functions of the mind into subordination and under control. It is only by sustained effort and severe concentration that the man of letters can succeed; the painter and the poet are helpless if their intellectual powers are not fully at their command. It will be said here that the exact purpose of college discipline is to prepare men for these exacting duties. But, in our observation, training at college bears so small proportion to that which comes with the competitions of life that it is scarcely traceable. We have always noticed that men whose necessities force them to bend their energies to work are the men who hold themselves well in hand, and that other men usually have little power of application; that is, the classification does not distinguish between educated and uneducated men, but between working and non-working men. In the list of men who have attained success, or contributed notably to the world's advance, it is not found that those who have exhibited remarkable mental power and intellectual self-command are specially on the side of the university class. Three of the most conspicuous men in English philosophy and science—Herbert Spencer, Huxley, and Tyndall—have developed their remarkable powers from the impulses of their natural gifts and not by the aid of college discipline or classical guiding. Perhaps their labors would have been easier under a thorough preparatory course—that is not easy to gainsay—but the fact remains that in the pursuit of their several ends they have brought their mental forces under complete and perfect control.

Zulu Beer.—*Manzi* is the Kaffir word for water, and the fact that it forms an affix for many Kaffir and Zulu names, such as *Dabulamanzi*, for instance, is a proof of the store which is set by this too often scarce commodity in those regions. The Kaffirs supplement their water and milk with beer, and in Natal it is contrary to law to sell, or even give, a

Kaffir spirits, though with regard to coolies and other colored folks this restriction does not apply. It seems a part of the utter want of system, that up to now prevails in the colony, that no sooner has a Kaffir crossed the Buffalo and set foot in the Transvaal, than he may buy as much liquor as he pleases; and the quantity of ardent spirits these people can drink with apparent impunity would hardly be credited if it were not a proved and notorious fact. Drink that would madden a white man has little or no effect upon the Kaffir; and a recent traveler among them writes that within his experience he has known of two soldiers dying within twenty-four hours of each other from drinking the poison known as Cape smoke, the same quantity of which, he was told, would only have imparted an agreeably comforting sensation to the tough Kaffir interior. Their beer, however, is drunk in moderate quantities. An innocuous fluid enough, thick, and slightly acid, not exactly nasty, though hardly agreeable to European tastes, especially when you are called upon to put your lips to the bowl which has previously gone the round of some hundred Kaffir ladies and gentlemen. It is not particularly heady, as it takes a whole day for the Kaffirs assembled at any festivity to get drunk upon it.

Greek Census.—The census of Greece has recently been taken, and as a rapid increase in population is almost always, in civilized countries, an indication of the material well-being of the inhabitants, it is satisfactory to know that this little kingdom has grown in numbers at quite a remarkable rate, for its population is now 1,679,775, or just about twice what it was in 1838, when the first national census was taken. The increase at and around the capital, Athens, is even more marked than in the country at large. Athens forty years ago was little better than a village, the effect of the Turkish rule being to keep down the size of the provincial towns. At that time there were no people who could properly be said to represent the Piræus. Ten years ago, however, Athens had 48,000 inhabitants, and the part of Piræus had 11,000. Now the capital city has a population of 74,000, and its maritime adjunct claims 22,000. In the census returns taken during the early days of the country under its present government, little attempt was made to determine the national wealth; but still property has increased in amount and value much faster than the population.

An Irish Advertisement.—"Mr. Hendrick's devoir to the gentry of Limerick. Would be elated to assign his attention for the instruction of eight or ten pupils, to attend on their houses every second day, to teach the French language, geography on the principles of astronomy, traversing the globe by sea or land on the rudiments of a right angle, with a variety of pleasing problems, attached to manners, customs, etc., of different countries, trade and commerce; phenomenons on volcanoes, thunder, lightning, sound, etc. Such as please to continue may advance through a course of natural philosophy, and those proficient in French may be taught the above in that language. N. B.—At intervals would instruct in the Italian language.

"J. Hendrick, Philomathos."

Some Parliamentary Bulls.—Miss Edgeworth tells us of an English baronet who proposed in the preamble of a bill that certain regulations should take place "on every Monday (Tuesday excepted)." This needless exception was equaled, however, by an act which Lord Palmerston assures us, provided for the possibility of Good Friday happening to fall on a Sunday. Another bill proposed to be introduced was one to repress suicide by making it a capital offense. An Irish member is said to have moved the addition to a bill for restricting the liberty of the press of a clause to compel the names of the authors to be printed on the title-pages of all anonymous works.

Literature and the Press.—A party of Boston literary gentlemen met a few evenings since "to celebrate the union between literature and the press." Just what has happened to make the present time especially opportune for such a "celebration," or why these Boston gentlemen were particularly called upon to provide it, or, indeed, exactly what is meant by "the union between literature and the press," we are unable to say. We do not know how it is in Boston, but in these parts, and, indeed, in all enlightened parts of the world, literature and the press have been in union for some time.

LITERATURE.

Mr. S. G. W. BENJAMIN has heretofore been a valuable contributor to the literature of art, especially in his two volumes, respectively entitled "Contemporary Art in Europe," and "What is Art?" To these two he now adds still another, which it may be presumed will prove still more largely a success than either of its predecessors,—a sketch of *Art in America*, both historical and descriptive.* The record here given of painting in our early times is certainly very creditable, with the names of Stuart, Sully, Trumbull, Allston, and Rembrandt Peale as chief representatives, while the last half century has been especially fertile in this department of art, with such names as Inman, Huntington, Weir, Cole, Durand, Kensett, Church, and Bierstadt, as chiefs among a great multitude quite worthy to be mentioned, extending in our author's table of contents to nearly a hundred. Mr. Benjamin has that indispensable quality of a good delineator, an admiration for his theme; but this excellence may by its excess become a fault, for indiscriminate praise is without value. The wood-cut reproductions of some of the chief works of the artists named are of only such a degree of excellence as may be seen in the magazine, in which relation most of them have, perhaps, done service. A careful and discriminating study of our chief painters may detect some little tendency towards an American style in their productions, though, for the most part, they only reproduce from foreign models. This work, it may be hoped, will render a good service by introducing the subject of which it treats among those whose lack of opportunities forbids them to study the works here described.

MANY of our readers will readily recall the pleasure given them by reading Mr. Thomas W. Knox's "Camp-fires and Cotton-fields," and his "Overland through Asia." And all such will be glad to learn that he is again before the public in his own specialty, and in a wide and highly important field, which is just now attracting a large share of attention. In the form of a record of the adventures and observations of two "Boy Travelers in the Far East,"* which, professedly fictitious only as to the persons introduced and the incidents of travels detailed, gives in the pleasing form of personal narratives a great amount of valuable information respecting affairs in Japan and China, as they exist and are transpiring at this time. Though apparently simply a romance of adventures, it is, in fact, a book of real travels, the routes passed over, the cities visited, the excursions performed, and the observations made being all real, the writer himself being the traveler as well as the chronicler of his own adventures. The book is valuable as an additional contribution to our rapidly increasing aggregate of intelligences respecting the two great peoples of the Orient, our antipodes, which, so long shut up from our Western world, have now become so completely open to our inspection. The form and style of the book will prove especially attractive to young persons for whom it is specifically intended, though older ones may use it to their own advantage. The illustrations, wood-cuts, are very many and of superior character.

THE BIBLE-READERS' COMMENTARY, of which the Old Testament portion was issued some time ago, is now completed by the publication of the New Testament in two large volumes, well printed on good paper, making altogether handsome and readable books.† The plan of this work is unique, but, therefore, the less to be praised. It is neither critical nor formally expository, neither textual nor discursive, and yet it is well adapted to its purpose of bringing out the sense and the spirit of the text. In the first volume, comprising the four Gospels, the sacred narrative is harmonized, and the whole matter divided into convenient sections. The same method

*ART IN AMERICA. A Critical and Historical Sketch. By S. G. W. Benjamin. Illustrated. New York: Harper & Brothers. 8vo. Pp. 214.

*THE BOY TRAVELERS IN THE FAR EAST. Adventures of Two Youths to Japan and China. By Mr. Thomas W. Knox, Author, etc. Illustrated. New York: Harper & Brothers. 8vo.

†THE BIBLE READERS' COMMENTARY. The New Testament in Two Volumes. Volume I. The Fourfold Gospel. Volume II. The Acts, The Epistles, and The Revelation. Prepared by J. Glentworth Butler, D. D. New York: D. Appleton & Co. Imperial Octavo. Pp. 685 and 831.

as to the sections is also pursued in the second volume, which comprises the Acts, the Apostolical Epistles, and the Apocalypse; but as only one discourse is considered at once, the harmonizing is not called for. The peculiarity of the work is that instead of original criticisms and expositions, the author presents with each subject choice paragraphs selected with evident care and from a very wide range, of authorities, commentators, theological writers, essayists, and preachers. Altogether these make up a rare collection of gems, and as practically valuable as they are beautiful; and by the skill exercised in their selection and application as called for by the matter in hand, they form a continuous exposition and application of the text. The work is evidently not designed simply for critical use, but for "Bible Readers," such as go to their Bibles to find food for the soul. To such it presents very decided advantages. It is beautifully and somewhat liberally illustrated with landscapes, maps, and diagrams.

We can conceive of no higher pleasure within the whole range of literature as a species of the fine arts than must arise from the study of the Greek poets by any one capable of such an exercise. In no other department of art, it may be safely declared, has the human genius attained to a greater degree of perfection or achieved higher or more lasting results. These productions have come down to our times having survived the millennium of the eclipse of taste and culture, and as they were among the most effective agencies in the Renaissance, so they are now among the most valuable possessions of the culture of our times. It is not at all strange, therefore, that scholarly men who have the leisure to do so, make special studies of these admirable works. Such a production we have now in hand, a revised and recent edition of two volumes issued some years ago but now rearranged and largely rewritten. The author seems to be admirably adapted both by scholarship and taste to his work, which, evidently he has engaged in and pursued as a labor of love. And the reader, in order to appreciate and enjoy what he has written with so much true heartiness, must also have in some small degree the same adaptations. But so successfully and happily has the spirit of Greek muses been transferred to the author's English that readers unlearned in the originals may detect much of their peculiar aroma in these "Studies."*

The inhabitants of our country appear to be just coming to appreciate the fact that they occupy the abandoned seats of an older and most thoroughly prehistoric civilization. Eastward of the Alleghanies comparatively few of the monuments of that civilization are found, but in the Great West, all the way from the Gulf to the Lakes, and from one mountain base to the other, they abound, while farther west are found the remains of another and somewhat less obscure civilization, evidently akin to the Aztec. This whole subject is still an unexplored field for the antiquarian and the ethnologist, with only enough brought to light to awaken expectation and to incite to more thorough and intelligent investigation. A contribution to this subject has recently been made in the form of a portly volume compiled by a gentleman of Ohio, whose attention appears to have been drawn to it by the mounds and other prehistoric monuments found in that State. In the present state of the subject little more can be done than to collect facts and materials for future use, and so far as this is done a real service is rendered to science. It is yet too early to construct theories in explanation of what is actually known, and, indeed, an entirely new department of archæology must be created before the problem of the "North Americans of Antiquity"† will be solved. And it will be through labors of such pioneers as the author of this volume that such a science will at length become a possibility.

Rev. T. A. Goodwin, whose book on "The Mode of Man's Immortality"‡ (denying the resurrection of the material body) was published several years ago, and then called out some pretty sharp criticisms, and subjected its

*Studies in the Greek Poets. By John Addington Symonds. Author of "Sketches and Studies in Southern Europe," etc. In Two Volumes. New York: Harper & Brothers. 12mo. Pp. 486 and 419.

†The North Americans of Antiquity, Their Origin, Migrations, and Type of Civilization Considered. By John T. Short. Illustrated. New York: Harper & Brothers. 8vo. Pp. 544.

‡The Mode of Man's Immortality, or the When, Where, and How of the Future Life. By Rev. T. A. Goodwin, A. M. (of Indianapolis.) Third Edition New York: Fords, Howard & Hulbert. 12mo. Pp. 264.

author to an ecclesiastical trial for heresy, seems not to be at all daunted or discouraged in his work of iconoclasticisms. A third edition of his book has just appeared, revised, enlarged, and very decidedly improved, making it altogether a decidedly respectable affair both as a literary production and as a polemic. Since the first edition appeared two of our bishops have entered the same field of discussion; but widely apart in their conclusions. Yet he goes a little beyond the more advanced of the two. He succeeds pretty well in adjusting his no-bodily-resurrection theory with Scripture, but not so well in getting rid of an intermediate state of departed souls and a real resurrection, *after a time*, not from the literal grave but from *Hades*, which seems to be pretty clearly taught in the New Testament. His idea of the resurrection appears to be simply *life after death*, very nearly the same that was held and taught by George Fox and his followers. But to our seeming this does not meet all the requirements of Christ's "coming again." Were the book a little less slang-whanging in its style it would better comport with the awfully important subject which it so ably discusses. But notwithstanding this serious fault it a valuable production and we doubt not that it is doing good. A rehearing of the subject had become a necessity, and, perhaps, it is here given in as unobjectionable a form as could have been expected.

The Winter's Tale is the last to appear of Mr. Rolfe's admirable edition of Shakespeare's plays.* The play itself is recognized as one of the most elaborately finished of all the productions of the great dramatist, ranking in the same class with the "Midsummer Night's Dream" and the "Tempest." It is rightly classed as a comedy, and yet it is quiet and even delicate, and quite free from the broad humor, and especially so of the grossness, that too often distinguishes and disfigures comedies. As in all that has gone before, so here, we find the editor's work rendered with great ability and with evident conscientiousness. This edition, now so well advanced,—fifteen plays have been issued,—will certainly take rank among the best ever issued; and for a thorough and painstaking study of the works of Shakespeare we know of no other altogether its equal.

THE plan of the "International Sunday-school Lessons," though open to some serious objections, has also very decided and probably preponderating excellences as compared with any that it has superseded. Among these is the fact that, as a great many schools are pursuing the same lessons simultaneously, more ample provisions may be made in the way of text-books for those lessons. Accordingly we have a thoroughly prepared commentary,* issued some time since, for the lessons for 1880. The first impression made by glancing over its pages is that it is quite too elaborate for those for whom it is designed. But since it is not expected that Sunday-school children will use them without the help of teachers and parents, this difficulty may be obviated. It is, in fact, all that a Sunday-school teacher will need in preparing for the school room and the recitation. The explanations of the text are clear and concise, and suited to their purposes; and the selected verbal illustrations appear to be judiciously made. Altogether it is a valuable contribution to the provision for the best kind of Sunday-school teaching.

THE Book Agents at New York (Phillips & Hunt) appear to have taken hold of the juvenile and holiday book business with a strong hand, and the result is some decidedly fine books of that kind.

Light for Little Ones (compiled by Martha Van Marter) is a square octavo of 344 pages filled up with childish stories and poems, and almost innumerable pictures, great and small, and will not fail to please.

Next we have, in the same form, *The Blossom Books*, ten in number,—Bud and Blossom, The Pansy Bed, The Children's Hour, The Daisy Chain, A Summer Wreath, The May Flower, Dew of the Morning, White Lily, Little Rose Bud, Work and Play (32 pages each),—made up very much after the style of the larger one before noticed.

Glenwood, by Julia K. Bloomfield (18mo., pp. 324), is a "story," according to the "regula-

* SHAKESPEARE'S COMEDY of the WINTER'S TALE. Edited, with Notes, by William J. Rolfe, A.M. With Engravings. New York: Harper & Brothers.

* THE LESSON COMMENTARY on the International Sunday-school Lessons for 1880. By Rev. John H. Vincent, D. D., and Rev. J. L Hurlbut. New York: Phillips & Hunt. Cincinnati: Hitchcock & Walden. 8vo. Pp. 252.

tion" pattern, fairly good of its kind. No doubt that it will be called for.

The Boys' Pocket Library.—24mo volumes, bound in cloth. III. *Men of Iron*—Three Great Potters, The Prussian Vase (pp. 288). IV. *Popular Delusions*—The Mississippi Scheme, The South Sea Bubble, The Tulip Mania, The Oil Mania, The Crusades (pp. 258). V. *Strange People*—The Love of the Marvelous, The Thugs, Alchemists (pp. 263). A valuable little library, 45 cents each.

DURING the past year there has appeared in monthly installments in *Harper's Magazine*, and also in one or more in Europe, a story entitled *Young Mrs. Jardine*, of much more than ordinary merit, as, indeed, the name of its writer, Mrs. Craig, gave cause to anticipate would be the case. But, probably, not all who have handled the monthly issues of Harper have taken this story in its monthly fragments. We never do so. Such, as well as many others, will be pleased to have the whole embodied in a volume,* well printed, in fair type, and on beautiful white paper,—just as it appears in its new setting. We are usually chary in recommending novels; but this is a really good one, and even the scrupulous may use it to advantage. Others, of course, will devour it.

THE CARTERS issue as holiday books, but not unsuitable for any other season, two neat little demi-quartos, in illustrated cloth covers—*Pickles*, by Yotty Osborn (pp. 168), and *Pinafore Days*, the Adventures of Fred and Dolly by Wood and Wave (pp. 101)—good and pleasant books for children.

THOSE who know the history of the Hebrew nation only as they learn it from the canonical Scriptures almost necessarily fail to appreciate the state of that people as they appear in the New Testament. During the period from the latest dates of the Old Testament canon to the coming of Christ very important events took place among them, of which some accounts are given in the Apocryphal books, and still more by Josephus. The people among whom Christ came, and both their political and ecclesiastical estate, dated back only about a hundred or a hundred and fifty years; and clearly to apprehend very many of the references and partial statements of the New Testament they and their affairs must be understood. A valuable help for this study will be afforded by the little work* just now issued, giving a complete and pretty full, though concise, history of the Jewish people during the period between the two Testaments, and especially during the reign of Judas Maccabæus. It is thoroughly learned and scholarly, yet popular in its style, and so natural and easy in its methods that it may be readily understood by the technically "unlearned." It is, indeed, a highly valuable little work.

ROBERT CARTER & BROS. continue to send forth their usual variety of new books—both originals and reprints—for all classes of readers who desire good and wholesome reading. A new and cheaper, but not a poorer, edition of Dr. Prime's *Songs of the Soul*† first claims attention. The book is a well known and general favorite, presenting a cluster of the very best of the minor religious poetry of the language—not the usual hymns as found in Church hymn-books, but a class of poems adapted rather to the closet or the leisure hour or to the family reading circle. The collector, in a prefatory "note," after thanking the public for the favor with which the work has been received, expresses his pleasure in view of the fact that in this plainer form the book will be within the reach of many who could not pay for one of the former and more costly edition. It is, indeed, a most excellent collection of poems, and quite worthy of a place in every household.

AMONG the holiday books for the season, designed especially for children, R. Worthington (750 Broadway, New York) presents *Chatterbox, Junior*, an imitation in kind and appearance (but wholly distinct in its matter) of its English Senior, and in no wise its inferior in quality. The reading-matter is good and the pictures fair and the whole judiciously made up.

The same publisher also offers two decidedly

*YOUNG MRS. JARDINE. A Novel. By the author of "John Halifax, Gentleman." New York: Harper & Brothers. 12mo. Pp. 414.

*JUDAS MACCABÆUS and the Jewish War of Independence. By Claude Reignier Couder, R. E. New York: G. P. Putnam's Sons. 12mo. Pp. 218.

†SONGS OF THE SOUL, Gathered out of Many Lands and Ages. By Samuel Irenæus Prime. New York: Robert Carter & Brothers. 12mo. Pp. 661. $2.00.

pleasant children's books) demi-quartos, in board covers, illustrated), *Merry Songs for Merry Singers*, and *Little Rosebud's Menagerie*. Both of these are of the kind of books that children value, and they are entirely unobjectionable in all their contents. Though specially adapted to the holiday season, they are quite suitable for all times of the year.

HOUGHTON, OSGOOD & Co. have issued a new edition of that ever-welcome and perennial classic, *The Pilgrim's Progress*, in a neat duodecimo, "freely illustrated," with a Memoir and Macaulay's "Essay;" and, best of all, without notes. It is just about such a copy of the immortal allegory as sensible people will desire.

The same publishers give us *Old Friends and New* (18mo, pp. 269), by Sarah O. Jewett, seven stories, exceedingly well told, and of wholesome tendency. Readers of "Deephaven," and "Play Days," formerly published books by the same author, will desire to possess this also.

THE *Franklin Square Library* made a harvest month of November, as will appear by the following list of its issues: 88. *High Spirits*, by James Payn. 89. *The Mistletoe Bough*, for Christmas, 1879, by Miss Braddon. 90. *The Egoist*; A Comedy in Narrative, by George Meredith. 91. *The Bells of Penraven*, by B. L. Farjeon. 92. *A Few Months in New Guinea*, by Octavius C. Stone, F. R. G. S. 93. *A Doubting Heart*, by Annie Keary. 94. *Little Miss Primrose*, by the author of "St. Olaves," etc. 95. *Donna Quixotte*, by Justin M'Carthy. Some of the numbers of this series are works of real merit, and in this form the same matter that would fill a volume may be had for ten or fifteen cents. Cheapening literature seems just here to have reached its *ne plus ultra*.

Old David's Lassie; or, Lost and Found. By Gretchen (Carter & Bros., 18mo., pp. 128), is a lively and sadly pleasant Scotch story, and, as the publishers' imprint seems to warrant, of good and wholesome character.

Pebbles by the Brook, Sermons to children. By Rev. Richard Newton, D. D. Same publishers. 18mo. Pp. 312. Excellently adapted to the designed purpose.

EX CATHEDRA.

ABOUT NEW BISHOPS.

ONE of the first questions asked, when the action of the coming General Conference is spoken of, relates to the episcopacy. Shall we have more bishops? If so, how many? Will the claims of the Germans and the colored people for one or more of their classes be heeded? Who are the persons most suitable or most likely to be chosen? All these are important questions, and it is certainly proper that they should be considered, and the whole subject of which they are parts thoroughly canvassed.

It is only an irrational and a sickly sentimentality that would forbid the fair and open discussion of this subject before the whole Church, and it should be done sufficiently long in advance to allow the response from the Church to reach the body in which the work is to be done. We, however, have learned to expect very little in this direction even from the constituent bodies, the annual conferences; and nothing from our principal Church papers,—with whom silence on all great Church questions has become a settled line of policy. We used to hear, in our childhood days, a kind of wise saying, which ran, "Little folks should be seen and not heard," but we had not expected to see it so rigidly carried into practice in these later days. [The "littleness" in this case is only relative, as the Alps are low beside the Himalayas.]

To the first question, answers in both directions are given. On the negative side, we are told that no more bishops are needed to do their proper work,—to preside at the conferences; that with a little over eighty conferences, in this country, each requiring a week's work for a bishop, even were the working force of the episcopacy reduced to the equivalent of seven men, there would be only twelve weeks of labor per year for each. The episcopal visitations to foreign missions, it is claimed, have been overdone, and should be abated, and by a wise distribution of the episcopal residences, and of the conferences to be presided over by each, it is

believed that the amount of traveling could be very considerably shortened, thus saving valuable time and labor and money. Then we are reminded that, as the collections for the support of the bishops are less than the demand, and as they are not increasing, it is proper that the question of support should enter into this discussion. Already the episcopal fund is largely indebted to the Book Concern,—and that indebtedness is steadily growing larger; and, as the feeling of the Church is unmistakably opposed to further using the funds of the Book Concern for that purpose, any proposed augmentation of the episcopal force necessarily suggests the question of ways and means. If, therefore, it could be deemed practicable properly to carry on the work with the present force, the problem would be most readily solved by electing no more.

We have heard another and somewhat unusual objection, but not unworthy of consideration. If elections are to be made, all will grant that only the best men should be selected; and when one looks about for such eligible candidates, they are found in places that can ill afford to lose them. The episcopacy may be conceded to be the most important position in the Church, and, therefore, its recruits should be called, when needed, from any other; but still there may be peculiarities of times and conditions that seem to form exceptions to this rule. Dr. Fisk was elected a bishop, and he declined the position (the solitary case in all our history), alleging, as his reason for so doing, that the interests of collegiate education in the Church at that time, and especially of Wesleyan University, presented a paramount claim for his services. If, therefore, that plea was good, in that case, it would be quite as good at the present time; and yet if new bishops are to be chosen, some of our chief institutions of learning would be likely, probably *ought*, to lose their heads. A delay of four years might, perhaps, resolve this difficulty to the satisfaction of all parties, and to the general advantage.

The arguments in favor of electing additional bishops are simple, direct, and obvious. Since 1872, when the last elections occurred, the force has lost two of its efficient workers by death, and, of the ten who remain, age and disease will require a deduction from their number and working force equal to from two to four more for the next quadrennium. To supply this falling off, five new men would be needed to restore the body to the effective power of eight years ago. This is the simple statement of the case, and from these facts must be drawn the arguments in favor of electing new bishops. We simply present them, and that is, perhaps, the most effective putting of the case. If the policy that prevailed eight years ago is to be continued, five new bishops will be needed. Whether or not the General Conference will conclude that the interests of the Church will require all this increase, or, indeed, any part of it, is not for us to prophesy.

But what about electing bishops from among the German and the colored ministers of the Church? We sometimes hear it said, "Show me the right man, in either of these classes, such a one as would be altogether eligible, were he an American white man, and I have no objection to his election." This answer entirely mistakes the case. It is quite impossible to ignore the differences of race and nationalities among us, and to assure the less numerous classes who may also have cause to suspect that they are exposed to some degree of race prejudices, it may be needful to raise some of them to the highest places in the Church. Personal fitness has never been the only consideration in choosing our bishops; and in political life, locality, nationality, and race, are all taken into the account. Why should they not be in this case? Both the Germans and the colored people are severally sufficiently numerous to entitle each of them, in view of their numbers, to a representative in the "Board" of Bishops. Nor are they so destitute of properly qualified ministers that they could not present candidates altogether worthy to be the peers of those with whom they would, if elected, be associated. Why, then, must their natural claims be disallowed?

To the last question, Who are the persons to be chosen? of course we shall not attempt to answer more explicitly than we have already done. We want able and educated men; devout, sound in the faith, good preachers, good administrators, unselfish, not easily puffed up, with a good physique, sound in body, not especially eccentric either in thought or action, and really of such greatness of character, that getting into a large place will not upset them. All this we want in our candidates—if, indeed, we want any.

THE PRESIDENT AND THE FINANCES.

THE President of the United States in his late message to Congress discusses the financial questions of the day with equal clearness and force. It is refreshing to see how quietly but effectually he sweeps away, by a few common-sense truisms, the clouds of fog and finesse in which ignorance and demagogism have enveloped this whole subject. And all this is the more encouraging because, although the President himself has uniformly sustained sound financial doctrines in all his public utterances, yet his administration, as represented by the Secretary of the Treasury, has not always sustained the same views. It may be devoutly hoped that hereafter there will be but one voice on this subject in administration circles, and that the whole influence of the executive department of the government will favor the policy set forth in the President's message.

Perhaps no other social institution, or outgrowth, rather, is at once so strictly a development, and so entirely incapable of change by arbitrary power, as are the laws of trade, and especially those that relate to the use of representatives of value—money. A complicated and closely compacted system, embracing all these things, is found pervading and permeating the whole world of mankind, except only the rudest savages, whose authority is above that of congresses and parliaments, whose laws should be studied rather than amended; and according to its requirements alone can financial affairs be transacted. By that system certain metals have been accepted as mediums of exchange; but the values of these in respect to each other, and of each to other commodities, are still subject to the paramount laws of demand and supply. As no legislation can fix the relations of gold and silver to corn or cotton or any commodity, so the relative values of these two metals can not be determined by the statute.

The utterances of the President indicate that, consciously or otherwise, he recognizes these facts and feels their force. He also seems to be aware, as some of those nearest to him officially do not seem to be, that it is not for single states or countries to say what shall be the laws of the commercial world. The political sovereignty may decree what substances shall be made the currency of its own dominion, but it can not fix the status of its "fiat money" in the world's markets. Were ours an isolated country, effectually shut out from the commerce of the whole world, then might Congress dictate what commodities should be used as money,—wherever payments are made under the authority of the courts,—the stamp of the government, and not the value of the material, determining its paying power. In such a case all that would be requisite would be that counterfeiting should be guarded against, and that the quantity issued should not exceed the public demands. But we are not such an isolated community; but, on the contrary, we are commercially an integral portion of an indivisible unity, whose laws spring out of its own conditions and defy the impotent intermeddlings of civil legislators. We are, therefore, compelled to regulate our finances by the standards accepted by the *consensus* of the commonwealth of nations.

The two invariable attributes of a sound and available currency are its *universality*,—accepted and used by the whole commercial world,—and its *stability*,—continuing the same, or changing only by its own silent actions. For centuries both gold and silver were so used; and because the relative values of the two metals were usually proximately uniform the duality of the metallic standard caused no great inconvenience. But within the not remote past the relative values of these metals have changed, and by the common consent of the mercantile world gold only is now the accepted standard; and to this our own government must practically assent, or suffer the consequences of futile efforts to legislate in opposition to the resistless laws of trade.

The whole people are to be congratulated that they have at the head of the government one who sees and feels the force of these things, and who has the courage to give formal utterance to his convictions. And yet we are compelled to ask, somewhat doubtingly, Will he be true to his own convictions, and use his legitimate powers to bring the government to the right action in this matter? That there is any room for such questionings is matter for regret, and yet there are not a few that would be very glad to know that they may be answered affirmatively. It requires courage as well as honesty to enable one charged with high and complicated responsibilities to sink the partisan in

favor of the intelligent and conscientious public functionary. The best class of our people are waiting the determination of these questions with a very lively interest.

GENERAL GRANT AND THE PRESIDENCY.

We have not felt much interest in the symptoms of political hydrophobia seen here and there in connection with the name of General Grant; but recently these indications have become sufficiently marked to justify a passing reference. It is especially noticeable that it is others than the professional politicians,—a kind of outer-court body,—that show the most marked concern about his relations to the next election for President. The great political lights and the leading political papers have been especially reticent on the subject; but another class, including several second-class religious journals, have seemed to be much exercised lest something terrible were about to happen. No matter what General Grant may do or not do, it all certainly means something. He went abroad; and every-where kings and nobles, scholars and divines, artisans and operatives, united to honor him,—all of which he accepted as given to him as a representative of his country, responding to each with remarkable modesty and propriety. But all this, it is more than intimated, was simply a vast electioneering pageant, gotten up by Grant's friends and partisans to make capital for a "third term." And now he has returned, and the same things continue,—a succession of ovations greet him all over the country; but all this, it is hinted, is the work of only a very few, and these usually very disreputable persons. True, the common people every-where greet him; and the great and learned, and even some of the "rulers of the people," join in the general acclaim, and this is the most fearful fact of all.

And for all this "unwarrantable" proceeding it appears that General Grant himself is to blame. If he does not promote it he at least permits it,—and that is very naughty. If he does not by any word or action of his own do any thing to make himself a candidate for the presidency, he might at least speak out, and say that he will not serve though elected by the voice of the whole nation,—and that, too, without waiting to be formally assured that any body is seriously thinking of offering him the presidency. Mr. Hayes volunteered, before he was elected, to announce that he would not serve a second term, which announcement a great Church dignitary declared was the best thing he ever did, but quite uncalled for. Washington, we are also reminded, declined a third term, which he had a right to do, but his so doing scarcely amounts to a Medo-Persian law for the government of all that may come after him. Possibly Grant may feel himself at liberty to make precedents as well as to follow them.

There are people who remember how some of these things stood twelve and eight years ago. Neither the party leaders nor the small fry that do their small work desired Grant for President in 1868; but the wise ones very well knew that they could elect no one else, and that probably, if they did not nominate him, he would be nominated nevertheless, and elected too. Eight years ago a nomination was made against him by a portion of the party that had so reluctantly accepted him four years before, and the campaign was conducted with the rallying-cry of "Any thing to beat Grant;" but Grant was not beaten,—though for its accomplishment, as never before, politics made very strange bedfellows.

We are not the keeper of those troubled spirits who appear to be so painfully exercised at the sight of what they seem to suspect to be the shadows of coming events, else we might suggest that the utterances of prophecies have sometimes brought about their fulfillment. The people have got used to the alarm cry about the "third term," and are no longer frightened by it. The framers of the Constitution, with all their carefulness, failed to see in a possible third term the dangers of which we are now so solemnly warned, and so they made no provision against it. Nor do we see any argument against a third term that is not equally applicable against a second. Like other unsubstantial phantoms, this stalking-horse of a third term ceases to alarm as soon as it is intelligently looked at. Probably the good sense of the people may be trusted; and whatever they may do, or not do, they are not likely to be frightened by the senseless cry of "Cæsarism," nor to be startled out of their proprieties by the proposition to elect for a third time the man who has never failed in any duty devolved upon him.

NATIONAL REPOSITORY.

MARCH, 1880.

WEST POINT MILITARY ACADEMY.

VIEW OF WEST POINT.

HOW the United States Military Academy at West Point came into being, what it is, and what its value to the great American republic, are questions of profound interest to every loyal citizen.

West Point is situated on the right bank of the Hudson, about fifty miles from New York, and opposite to Constitution Island, round which, in its southerly course, the river makes a sharp turn to the eastward, and then resumes its ordinary direction. The best view of this famous locality is from the ruined walls of Fort Putnam on the hill about one thousand feet to the west of the Academy building. From thence the eye takes in all the plain with most of the structures and monuments engirding it; the long reach of the river northward, with Pollopel's Island, and the beautiful city of Newburg in the distance; Constitution Island and the village of Cold Spring with its famous cannon foundries to the north-east; the houses of Hamilton Fish, Samuel Sloan, and other magnates to the east; a little further to the south the comparatively unchanged mansion in which Benedict Arnold treacherously plotted the surrender of this national stronghold to the British; and on the south the promontory of St. Anthony's Nose, together with the Dunderberg range of hills. Cinctured by massive mountains and shining river, West Point is a richly engraven gem set in the midst of amethyst, topaz, and diamond grouping.

The tract of land now owned by the United States Government at West Point contains two thousand one hundred and five acres, and was first settled in May, 1723. The boundary line runs along the river shore from the South Landing to a point on the southern slope of Cro' Nest Mountain, and back into

the country from those *termini* a distance of two or three miles. The greater part of this area was purchased of Stephen Moore for eleven thousand and eighty-five dollars, on September 10, 1790. The smaller and southerly portion was bought of Oliver Gridley on the 13th of May, 1824, for ten thousand dollars. On March 2, 1826, the State of New York ceded jurisdiction over that part of the property on which the principal edifices connected with the institution stand; and only "reserved the right to execute any process, civil or criminal, wherein the real or personal property of the United States was not affected."* The land itself is in a region of primary stratified rocks, thickly covered with drift deposits susceptible of cultivation only in scattered spots, and that not without immense expenditure of money and labor.

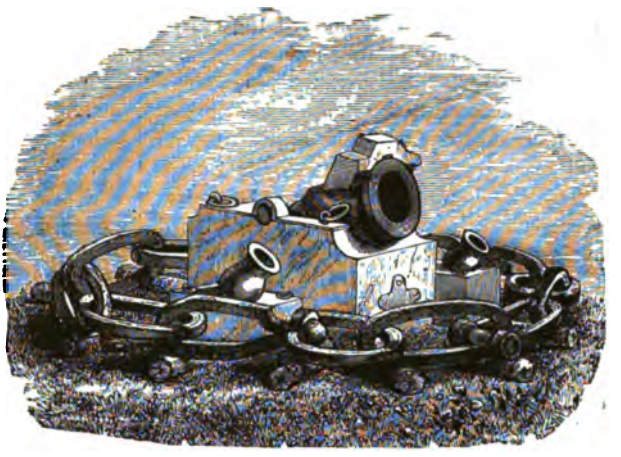
CONSTITUTION ISLAND.

The paramount importance of West Point during the Revolution, was due to its command of the Hudson the grand thoroughfare for freight and passenger traffic between the seaboard and the interior. In 1775 the Provincial Congress, pursuant to the wishes of the Continental Congress, resolved to fortify Highlands, and sent commissioners, accompanied by Colonel Bernard Romans with twenty-four men, to execute its plan. Romans was a willful, choleric Hollander, an ex-employé of the British crown, and an engineer by profession. He constructed the fortifications on Martelaer's Rock or Constitution Island; but in such unscientific manner as to draw upon himself the keen ridicule and sharp strictures of more capable men. His works could have been assailed from the higher ground across the river without any danger to the enemy. For these and kindred reasons, Messrs. Robert R. Livingstone, R. T. Paine, and J. Langdon, the committee of inspection appointed by Congress, advised, in their report of November 23, 1775, that West Point be occupied and fortified.

The wise counsel of the committee was not followed, and "the key to the passage in the Highlands," temporarily fell into the hands of the enemy. On the 7th and 8th of August, 1777, the British forces under General Howe ascended the river to effect a junction with the army under Burgoyne, who was supposed to be advancing from the north, and on their way completely destroyed all the works and stores which had cost the country no less than a quarter-million of dollars. After an occupation of twenty days the British abandoned the Highlands, and thus gave opportunity to the Americans for the erection of defensive works which proved to be an insurmountable barrier to all further incursions by this route. General Washington strictly enjoined Putnam to employ all his resources of men and means in their construction. Governor Clinton heartily concurred in the measures proposed and strenuously recommended that "a strong fortress should be erected at West Point." On the 9th of January, 1778, the Provincial Convention of

* "Boynton's History of West Point," page 12. New York: D. Van Nostrand.

New York appointed a committee to act in concert with Generals Putnam and James Clinton in fixing upon the places where fortifications should be established. Three days were spent in examining the ground near and at West Point, and the superior facilities it afforded for obstructing navigation were clearly ascertained. About the 20th of the same month General Parsons's brigade crossed the river to West Point, and at once, amid severe cold and deep snow, commenced operations according to the plans of Lieutenant-colonel Radiére, an impatient and petulant Frenchman. Major-general Putnam held supreme command. Radiére left early in March, and was succeeded by Colonel Rufus Putnam of Massachusetts, an able engineer, who built Forts Wyllis, Webb, and Putnam. Kosciusko, a Polish patriot, who had served as chief engineer of the northern army against Burgoyne, then assumed control, and finished the works in a style that endeared him to his associates and greatly enhanced his reputation.



PART OF THE GREAT CHAIN.

In April of the same year the great chain designed to bar the passage of the river was put together, "all fixed," at New Windsor, floated down to West Point, and secured in its proper place. It stretched across the river to Constitution Island, and was attached to great blocks of stone on each side, where it was protected by strong batteries of artillery. The links of the chain were about twelve inches wide by eighteen inches long, the iron being about two inches square. The chain itself was buoyed up by very large logs, pointed at the ends and about sixteen feet long. Cables, connected with anchors in the bed of the river, gave it stability and enabled it to serve as a foot bridge for those who cared to essay the perilous passage. It is said to have weighed about one hundred and eighty-six tons and cost £5,945 3s. and 1d. Relics of it may now be seen in Fort Clinton, on Trophy Point, and at Newburgh.

Early in June the principal work on the north-east angle of the plan had so far advanced that it had received its garrison and also the name of Fort Arnold, by which it was designated in military correspondence and garrison orders, until after his traitorous defection from the patriot cause. On the 25th of July, 1779, the headquarters of the commander-in-chief were transferred to West Point, and established in Moore's house, since torn down, at the mouth of a narrow gorge, now known as Washington Valley. The remains of the roughly paved causeway leading thereto are still an object of interest to curious visitors. From that humble mansion, in which he lived until November 28th of the same year, General Washington issued a telling addition to "Many and pointed orders . . . against that unmeaning and abominable custom of swearing."

On the 5th of August, 1780, General Benedict Arnold relieved General Robert Howe of the command of West Point and its dependencies. He was already meditating the baseness which clings imperishably to his memory. The condition of affairs flattered him with hopes of success. A cloud of witnesses testify to the fact that both sides were weary of the struggle and anxious for an accommodation. The army, ill-paid, ill-fed, ill-clad, was alarmingly dissatisfied. "Regiment after regiment rose in mutiny, nor could

the rope or the scourge check the devastation and desertion that marked the army's course."* France hesitated about continuing her assistance and Spain was not trustworthy. Congress was rent by faction and intrigue, relations with the States were on bad footing, bickering between the Americans and the French under D'Estaing had occurred, and a strong political cabal plotted against Washington. West Point had cost three million dollars in addition to three years' of labor by the local force, and was accounted the American Gibraltar, impregnable to an army twenty thousand strong. Its loss implied irreparable injury to the Revolution and would have portended incalculable evils.

Arnold had begun a correspondence in the previous year with John Anderson, the

pseudonym of Major John André, adjutant-general of the British army. His own signature was Gustavus. The main subject of discussion was the betrayal of West Point, and the price the betrayer was to receive for his crime. After several providential hindrances he secured a personal interview with André on Friday, the 22d of September, first in the woods, and then in the house of Joshua Hett Smith, two and a half miles below Stony Point, and there matured the plans for the consummation of his villainy. Arnold then returned to the Robinson House while André essayed to reach New York by land. The capture of André, the discovery of treasonable documents in Arnold's handwriting upon his person, his trial and execution as a spy, and the touching incidents of his imprisonment and death are all matters of authentic history. West Point was saved, patriotism recovered its energy on the edge of terrible danger, and hope rose triumphant over hardship and destitution. Times began to improve, and the arms of the patriots to obtain additional successes. Great rejoicings were held at West Point on May 31, 1782 over the birth of the Dauphin of France, whom the achievements of the Americans indirectly consigned to the horrors of slow starvation, and unspeakably brutal treatment at the hands of his flinty jailor.

In 1783 came the recognition of American independence. Political connection with Great Britain was severed for ever, and the United States were at liberty to repair the ravages of war by the arts of peace. West Point then lost much of its interest to the nation. In and after 1785 old arms and camp equipments were sold, the boom and chain removed, and the redoubts dismantled. Relics of the great struggle were numerous, and especially of the combatants, of whom not the least conspicuous was Captain "Molly Pitcher, a stout, red-haired, freckle-faced young Irish woman, with a handsome, piercing eye."* Her husband was slain at the battle of Monmouth while serving a gun. Molly saw him fall, seized the rammer, discharged his duties, and avenged his death with a skill and courage that elicited universal admiration. General Greene presented her as she was, covered with dust and blood, to General Washington, who made her a sergeant and had her name put upon the half-pay list for life. She was a great favorite in the army, and usually wore a cocked hat, and an artillery man's coat over her dress. After the declaration of peace Captain Molly took up her abode about three miles below West Point. She does not appear to have been a specially bright or pleasant woman. Major George Fleming, the

*Boynton's "History of West Point." Page 89.

*Lossing's "Field-book of the Revolution," Volume II, page 155.

commandant at the post, who, in some way, had charge of her, represents her as "such a disagreeable object to take care of, and as 'much in want of shifts,' whereof she bitterly complained." The gallant major adds, under date of April 21, 1787, "If you"—the equally gallant Major-general Henry Knox, secretary of war—"think proper to order three or four, I should be glad." The major had none of that kind of ordnance among his stores.

As early as October, 1776, the most sagacious and practical of the Revolutionary fathers had recommended the Board of War to "prepare . . . a military academy," and to "provide the same with proper officers." The Continental Congress appointed a committee of five to report a plan, but nothing further was done. The project was again discussed in 1783, and again in 1790, when General Knox proposed the establishment of an "efficient institution" for the "military education of youth," and predicted that thereby "a glorious national spirit will be introduced with its extensive train of political consequences."* In 1793 General Washington suggested the expediency of founding such a school in his annual message to Congress. Jefferson opposed it as unauthorized by the Constitution, but, notwithstanding, a military school was established in the following year for the instruction of a resident corps of artillerists and engineers, and books and apparatus were supplied. The academical building used for the school was burned down in 1796, and further operations were suspended until 1801, when they were resumed under the direction of Mr. George Barron, a private citizen, who taught mathematics to the few cadets then in service, but with such inefficiency that the school "ran into disorder and the teacher into contempt."

SCENE OF ARNOLD'S TREACHERY.

An act of Congress, passed March 10, 1802, provided for the establishment of a military academy at West Point. Another act, on February 28, 1803, empowered the President to appoint one teacher of the French language and one teacher of drawing. Five years afterward supplemental legislation was proposed by President Jefferson, who had wholly changed his opinions as to its constitutionality, with a view to the increased efficiency of the institution. His message, accompanied by the report of the superintendent, Colonel Jonathan Williams, was referred to a committee which, on April 8, 1808, reported a bill adding one hundred and fifty-six members to the corps of cadets. President Madison, in 1810, and again in 1811, reminded Congress of the importance

*Boyton's "History of West Point," page 182.

CAPTURE OF MAJOR JOHN ANDRÉ.

of military seminaries, which, he averred, "in every event will form a valuable and frugal part of our military establishment." On the 29th of April, 1812, an act of Congress still further widened and strengthened the basis of the academy, and with such manifest results that President Monroe, in his annual message of 1822, pronounced strong encomiums on its discipline and management.

Colonel Williams resigned the superintendency on the 31st of July, 1812, and was succeeded by Captain Alden Partridge, who was followed by Colonel Joseph Swift. Captain Partridge again assumed the office and held it from January 13, 1817 to July 28, 1817, when brevet Major Sylvanus Thayer, of the corps of engineers, took his post and filled it with brilliant ability until July 1, 1833. The splendid reputation of the military academy, both at home and abroad, "for its strict, impartial, salutary, elevating, and disciplinary government" is due to his excellent administration. Thayer was an early graduate of the academy, had served with distinction in the war of 1812, had studied in the military schools of France, and was eminently qualified for the work he had to do. In the best sense of the word, he was the father of the United States Military Academy at West Point. He found it in somewhat chaotic condition, both as to organization, course of study, administration, and discipline. His genius soon evolved order from chaos, and imparted that stern, unbending regularity which has since been one of its most characteristic features. In fact, he was deemed too stern in his management, and was relieved at his own request. Colonel De Russy, of pleasant memory, under whom the present academic hall was commenced, became his successor, and was followed on September 1, 1838, by Major Richard Delafield, under whom the Library Building and Ordnance Laboratory were erected and sundry admirable roads constructed. Captain Henry Brewerton next succeeded, August 15, 1845. During his incumbency the spacious Barracks and Mess Hall were built, the plain graded, and other valuable improvements effected. Colonel Robert E. Lee, of sad and eventful career, assumed control on September 1, 1852, and on his promotion to the cavalry arm of the service, April 1, 1855, gave place to Major Jonathan G. Barnard. Major Richard Delafield was his successor, September 8, 1856, and erected the bell and clock tower of the

academy, completed the gun-works, restored Fort Clinton, and provided additional accommodation for the families of the officers and professors. On January 23, 1861, he was relieved by the appointment of Major P. G. T. Beauregard, who only held office for five days, being instructed by the secretary of war to transfer the command to Major Delafield, which he did. On March 1st following Major Delafield was finally relieved from duty by the appointment of Major Alexander H. Bowman. General Z. B. Tower followed July 8, 1864; General G. W. Cullum September 8, 1864; General T. G. Pitcher August 28, 1866; General T. H. Ruger September 1, 1871, and Major-general Schofield, the present superintendent, on September 1, 1876.

WEST POINT AS IT IS.

The visitor to West Point will usually cross the stream from Garrison's Station on the Hudson River railroad to the South Landing, or will debark at the same spot from the day boat to or from New York. Stepping ashore, he is confronted by a steep, rocky bluff, crested with foliage and capped by the carriage road to Highland Falls.

"What though no cloister gray or ivied column
Along this cliff its somber ruins rear;
What though no frowning tower or temple solemn
Of despots tell, and superstition here;
Yet sights and sounds at which the world has wondered
Within these wild ravines have had their birth.
Young freedom's cannon from these glens have thundered,
And sent their startling echoes o'er the earth;
And not a verdant glade, or mountain hoary,
But treasures up within the glorious story."

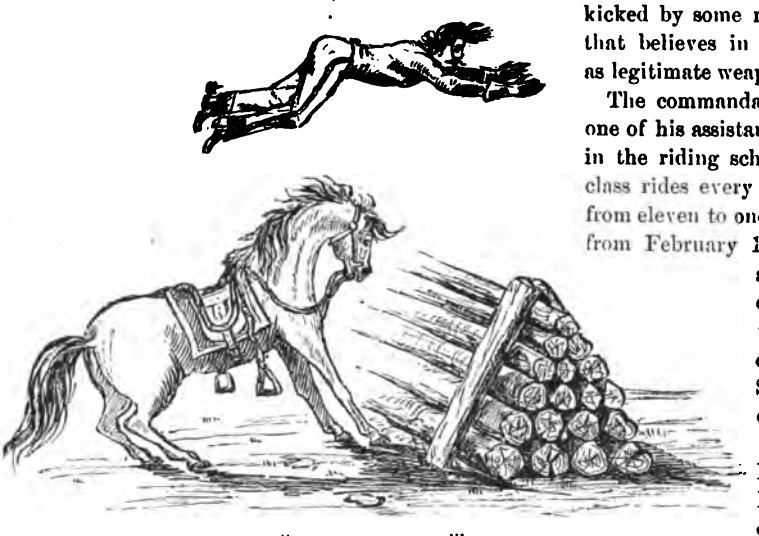
A difficult, winding ascent, consisting of roughly hewn stone steps, leads up to the guard-house at the southern entrance. Two or three soldiers, whose principal duty seems to be the prevention of intrusion by undesirable people in undesirable ways, are there posted. Probably they are veterans who enjoy what the Scotch term a conversational "crack," and who can reel off yarns by the hour of siege, battle, and adventure during the rebellion; of hair-breadth escapes while fighting savage Indians, or of field and flood in the far-off India, China, Africa, or wherever else they may have warred under the well-nigh ubiquitous flag of St. George. One of them can narrate in vivid detail his experiences at Lukkur in Scinde, the events of the first Afghan war, and how he found

himself, on his return to England, the youngest member and the oldest service sergeant of his regiment. He served under Sir Henry Havelock, the *beau-ideal* of modern Biblical soldiers.

Turning to the right along an excellent flagged sidewalk, the eye is riveted by the charming panorama of mountain ranges, whose feet are laved by the lordly, cloud-flecked flood which rolls below. The Hudson wears the aspect of a beautiful lake inclosed by verdant heights. It reminds the traveler of the Scottish Highlands, and recalls stories of the wild MacGregors and rival plaided clans who, in days of yore, hunted the red deer in the rugged glens. The muse of Sir Walter Scott is needed to do justice to the scenery. It excels that which lay under his vision when he penned that memorable description:

"One burnished sheet of living gold
Loch Katrine lay beneath him roll'd,—
In all her length far winding lay,
With promontory, creek, and bay,
And islands that, empurpled bright,
Floated amid the livelier light,
And mountains, that like giants stand,
To sentinel enchanted land;
High on the south, huge Ben Venue
Down on the lake in masses threw
Crags, knolls, and mounds confusedly hurled,
The fragments of an earlier world;
A wildering forest feathered o'er
His ruined sides and summit hoar,
While on the north, through middle air,
Ben An heaved high his forehead bare."

More prosaic but far more comfortable are the neat and commodious villas on the left of the path—villas occupied by general service officials, assistant professors, instructors, and members of the medical staff. Soon the road bifurcates. Taking the one to the right, after traversing a distance of about eight hundred feet, the Riding Hall is reached. Enter freely. It is of enormous size, with a concave roof. A gallery for visitors is on the south side. If the cadets are drilling, a succession of scenes more interesting than those of a circus may be expected. Sometimes they are funny, as when a city-bred, nervous novice mounts a charger of doubtful reputation. "The horse knoweth his rider," particularly if he be a poor one, and is certain to amuse himself in his rough, equine way. There he goes, thrusting his ears into his rider's chest, bumping and thumping against his companions in obstreperous style, forging ahead by willfully keeping inside the moving ellipse, and then wickedly halting at a convenient corner, while his temporary master flies from his back at a tangent. "There goes John!" screams a little girl, who watches her warrior brother's equestrian feats. The boys turn in their saddles and laugh, for John's acrobatic flight has ignominiously ended in the tanbark. The laugh is quickly suppressed by the officer in charge, and John devotes himself to catching the truant Bellerophon, who actually shakes his sides with laughter at the success of his stratagem. Never mind, John, somebody else will come to grief soon. It may be while proudly emulating some Comanche feat, or when his steed stupidly halts and bucks at the hurdle, or where he fails to hit the head he ought to split or pierce with ball, or in equitation of squadron or company, or when kicked by some malignant brute that believes in iron-shod heels as legitimate weapons of offense.



"THERE GOES JOHN!"

The commandant of cadets, or one of his assistants, is instructor in the riding school. The third class rides every other week-day from eleven to one o'clock, except from February 1st to May 1st; and the second class from two to four every other week-day, Saturdays excepted, from November 1st to March 15th. For cavalry exercises the first class is divided into two equal parts, according to general merit, in September. Their drill is principally in the open air. Through success and failure, in alertness and silence, the cadets advance to an equitation that, for steadiness of nerve, discipline of muscle, firmness of seat, and ability to bring every faculty into efficient play, has no superior in either hemisphere. Adjoining the riding hall are stables with stalls for one hundred horses.

Emerging from the riding hall the hospital is easily reached by a winding footpath. Dr. Charles T. Alexander is in charge. His assistant, Dr. H. Lippincott, also attends the soldiers' hospital. In both institutions the ills to which martial flesh is heir receive prompt and skillful treatment. The cadets enjoy the kindly ministrations of two matrons and a hospital steward. No one is

permitted to visit them, save with consent of a medical officer of the post. A much larger and more elegant hospital, hard by the old Gridley mansion, is almost finished, and will amply meet the necessities of the academy for many years to come.

Next comes the Mess Hall, a handsome stone edifice, built in 1852, one hundred and seventy by sixty-two feet, costing $43,187, and containing a central hall ninety-six by forty-six, and twenty feet high, in which the cadets sit down to meals three times a day; and in which, at three public balls in Summer, they whirl round to the sound of music in the mazes of the dance. Dancing is part of their military education, and is compulsory unless the embryo soldier plead religious scruples in excuse for non-attendance. No building on the Point is better known to many feminine votaries of frivolity and fashion than this. The north wing is occupied by the purveyor, and the south wing contains the mess-rooms of the bachelor officers attached to the academy. The kitchen and bakery are in the rear, and the basement is inhabited by the employés. The cadets are marched in soldierly order to and from meals—which comprise abundance of wholesome and various food—and are obliged to observe gentlemanly etiquette while enjoying them. Military habits and aptitudes thus become organized even at the table. Major B. Du Barry is the quartermaster and commissary of cadets, and is charged with all matters relating to the clothing, equipment, and subsistence of the students, including purveying and supervision of the cadets' mess.

Opposite to the mess hall is the spirited and imposing statue of General Custer, bareheaded, sword in one hand, pistol in the other, as he is supposed to have looked when in deadly conflict with the Sioux at the battle of Rosebud Creek, where he fell, together with his entire command. His is the only statue that can be discerned from the river, and seems as if, with menacing gesture, he keeps perpetual watch and ward at the door of his *alma mater*.

ACADEMY BUILDING.

North of Custer's monument is the massively beautiful, fire-proof structure known as the Administrative Building, in which are the offices of the superintendent, Major-general John M. Schofield, who is also commanding officer of the department of West Point, and of the different members of his military staff, including the adjutant and the treasurer.. Still farther to the north is the Chapel, a modest stone structure, whose acoustic properties are not improved by the pillars intended to support the roof. It was erected in 1836, is enriched by a masterly symbolical painting over the chancel by the hand of Professor Weir, and is venerable by reason of the British and Mexican guns and colors which lend such interest to its walls. The generals of the Revolution are commemorated by black marble tablets, bearing in gilt letters their honored names. One of these slabs evokes inquiry from the significant appearance of the surface. Between the lines "Major-general . . . Born 1740," the name has been cut out. It recalls the memory of the renegade, Benedict Arnold. In this chapel, the Rev. John Forsyth, D. D., LL. D., chaplain, professor of history, geography, and ethics, a distinguished clergyman of the Reformed Church, and a former Princton professor of Latin and history, holds forth the word of life on the Lord's Day, and on Saturday delivers his lectures on history and ethics. All the cadets attend divine worship in full uniform, unless excused by reason of sickness, religious scru-

THE CHAPEL.

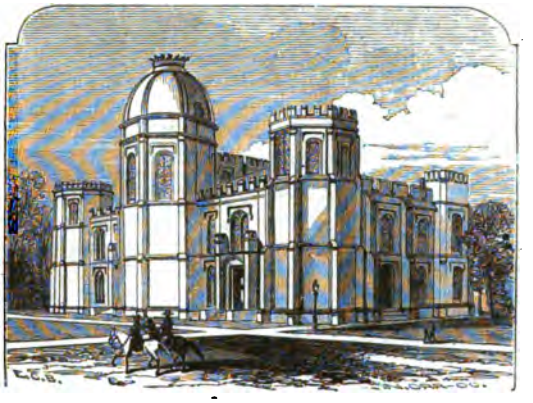
ple, or permission to attend the Churches of their respective denominations. In the Summer season the pews not allotted to cadets are crowded by visitors, who are welcomed to those assigned to resident civil and military officials and their families.

East of the chapel is the Library and Observatory, a castellated edifice, one hundred and sixty by seventy-eight feet, erected in 1841, and containing a collection of twenty-five thousand volumes. An annual grant of two thousand dollars by Congress keeps up a supply of new books and a choice selection of periodical literature. The library proper is forty-six feet square, thirty-one feet high, and is adorned by portraits of celebrities formerly connected with the academy. Conspicuous among these is that of Colonel Thayer. The lower floor of the building embraces several recitation rooms. In the second story is a lecture-room, and the ample and valuable scientific apparatus belonging to the philosophical department. The dome of the observatory covers a powerful telescope. A transit instrument and mural circle are in the towers. The public are made free of the library throughout the hours in which it is open for use. An officer of the academy, assisted by a detailed soldier, is librarian, and is accountable for the books and other property. It was while resident at West Point that Dr. William Nast, a highly educated graduate of Tübingen University, and a scholar of pronounced rationalistic and skeptical opinions, was powerfully affected by the preaching of the late Rev. James H. Romeo. Dr. Nast was soon afterwards thoroughly converted to Christ, and became the historic and heroic founder of German Methodism in the United States and Europe.

Leaving the library and proceeding westwardly across the street, the Academy Building next challenges examination. It was erected in 1838, is a stone edifice with red sandstone pilasters, two hundred and seventy-five by seventy-five feet in dimensions, three stories high, and cost originally sixty-eight thousand two hundred and fifty-four dollars. In the south end, on the lower floor, is the chemical department, including the laboratory, lecture-room, room for electrical experiments, and a work-room, each about thirty-six feet square. The Fencing

School, M. Antoné Lorentz, an agile, muscular gentleman of French parentage, sword master, seventy-five by thirty-eight feet in superficial area, occupies the lower floor at the north end. The central portion contains an excellent gymnasium, and accommodations for committees and courts-martial. In the second story, over the Chemical Department, is the Cabinet of Minerals and Fossils, through which the janitor conducts his temporary guests and pours out his descriptions with a volubility, precision, and promptness that leave nothing to be desired from a military point of view. Of course, he is an old soldier. The room contains many military mementos and trophies, also sundry rare curiosities, and among them a model of the silver mine at Valenciana in Medico, manufactured as a present to the pope of Rome, but purchased in 1847 by the United States officers whose names are affixed, and presented to the Military Academy. Over the Fencing School is the Engineering Department, to which are attached two engineering model rooms, each forty-six by twenty-two feet. Seven recitation rooms, each twenty-four by twenty-two feet, and simply fitted up with seats, desk, and wall blackboards, fill out the remainder of the space on this story. In the third story, over the Cabinet of Minerals, is the Artillery Model Room, seventy-five by thirty-eight feet, the Mineralogical Recitation, the Geographical, and the Mathematical Model Rooms, while over the Engineering, is the Drawing Department, which is of the same dimensions. Connected with the latter are the Picture Gallery and Gallery of Sculpture, each seventy by twenty-two feet. The intrinsic value and artistic excellence of the contents of these galleries by no means surpass those of other collections; but it should be borne in mind that these are purposely of educational character, and designed to serve practical uses. Three recitation and four storerooms complete the interior of this story. A tower on the north-west angle of the building contains the clock. The majority of the recitations are held in the Academy Building, the cadets marching thither in military order, and saluting the instructor as they enter his room.

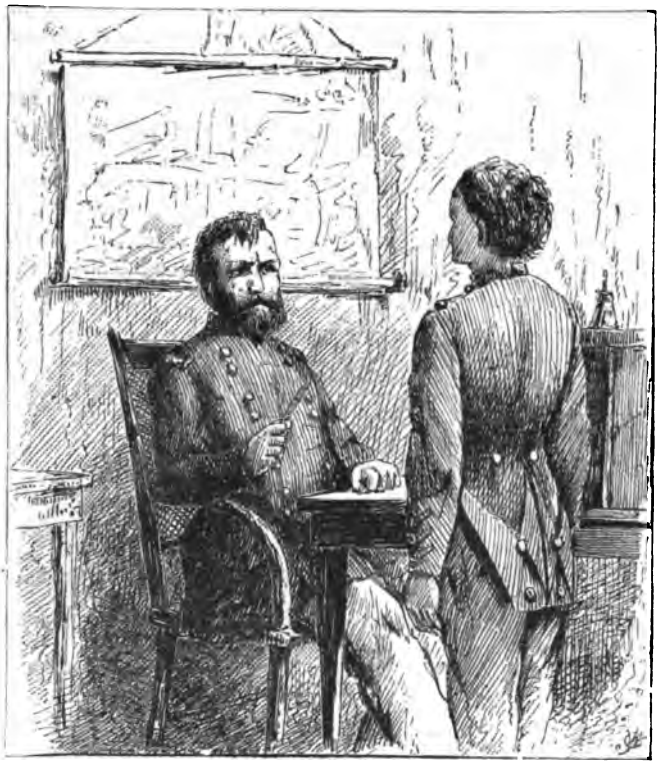
The post at West Point, including the Academy, constitutes a separate Military Department of which the commander reports directly to the general-in-chief of the army of the United States. Its administration is assimilated to that of an army in the field. The superintendent is appointed by the President, is commander and governor of



LIBRARY AND OBERVATORY.

the institution, directs the studies, academic duties, and field exercises of the pupils, and reports on all that pertains to its progress and welfare to the secretary of war and to the general-in-chief. The professors and staff officers of the army, and the other heads of departments of instruction and the officers on duty in those departments, constitute the Academic Staff. The commandant of cadets, Colonel H. M. Lazelle, has immediate command of the battalion of cadets. In addition to the officials mentioned, the President may detail as many cadets to act as assistant professors as may be needed, such appointments being honorable distinctions.

The Academic Board consists of the superintent and heads of the several departments of instruction. A majority of the Board constitutes a quorum. The Board recommends text-books, books, maps, models, and apparatus to the war department for adoption in the Academy; examines cadets, decides their merits, grants diplomas, recom



CADET BEFORE THE SUPERINTENDENT.

mends for promotion, suggests improvements in the system of studies and instruction, and holds its own deliberations under the seal of secrecy, except in so far as it may decide to make them public. The adjutant of the Academy, Lieutenant Michler, officiates as secretary of the Board. The quarter-master of the Academy, Lieutenant C. P. Miller, has, under direction of the superintendent, control of all purchases, disbursements, and local improvements. The purchases of the quarter-master and commissary of cadets are all inspected by a board of three officers appointed by the superintendent, which also audits his accounts for clothing, and all other authorized charges against cadets. The quarter-master of cadets is also the treasurer, but makes no payment on account of any cadet without authority from the superintendent.

If all the superintendents have been as inflexible as Colonel Thayer is said, by General Francis Smith, president of the Virginia Military Institute. to have proven, spendthrift habits have uniformly received decided and severe check. A classmate of the latter applied to Colonel Thayer for an order for four shirts. The superintendent refused it. The poor fellow was in great need, and he ventured to expostulate.

"Colonel, I am much in need of shirts."

"I take it for granted you are, or you would not present this order; but you are in debt," and again the book is pitched towards the cadet.

"But, colonel, I am almost destitute. I have only one shirt to my back, and that is a *fatigue-jacket.*"

"Well, Mr. Dewey, I would advise you to wear that fatigue-jacket until you get out of debt."

The present number of cadets is about three hundred. Of all candidates who obtain an appointment to the Military Academy, from forty to sixty per cent succeed in graduating. The remainder resign or are discharged after due examination in January and June of each year, for deficiency in study, or discipline, or both. Candidates for admission are selected on the nomination of Congressmen—one from each Congressional District. The President also appoints ten at large during his official quadrennium. All report to the superintendent between the 1st and 20th of June, are examined after the semi-annual examination of cadets, and, if prevented from attending at that time, may be examined in the last three days of August in which case they are dubbed "Seps" by predecessors. Each candidate must be able to read and write the English language correctly, to perform arith

metical operations as far as decimal fractions, to demonstrate his knowledge of elementary English grammar, descriptive geography, especially of the United States, and of the history of our own country. He must not be under seventeen, nor over twenty-two years of age, not under five feet in height, neither deformed, nor incapacitated by disease for military service, nor suffering from infectious or moral disorders. The standard of preliminary qualification is certainly too low, and should be raised, both in moral and educational particulars.

The candidate can not be admitted if married, neither can he contract matrimony while an undergraduate. The Rev. Dr. Perry, of the New York East Conference, who died at Fort Pulaski, Georgia, in the early stages of the rebellion, while in command of a regiment of New York Volunteers, was married before he entered the Academy; but when the fact was disclosed he was obliged to resign his warrant. No candidate receives his warrant until after the January examination, and then only on condition of satisfactory moral and military conduct. Till then he is simply a "plebe." When admitted he takes a stringent oath of allegiance.

The course of study is as follows: First Year, Fourth Class: Mathematics, French Language, and English Studies, History, Geography, and Ethics, Tactics of Artillery and Infantry and Use of Small Arms. Second Year, Third Class: Mathematics, French Language, Drawing, Tactics of Artillery, Cavalry, and Infantry. Third Year, Second Class: Natural and Experimental Philosophy, Chemistry, Drawing, Tactics as in Second Year, and Practical Military Engineering, including Signaling and Telegraphy. Fourth Year, First Class: Civil and Military Engineering and Science of War, Mineralogy, Geology, the Spanish Language, Law — International, Constitutional, and Military—Practical Military Engineering, Tactics as in Third Year, and Ordnance and Gunnery.

This comprehensive curriculum requires hard study throughout the four years of pupilage in order to acquire the mastery of its details. Much of it is only studied in outline. Whatever is deemed indispensable to soldierly efficiency is studied closely and minutely. Whatever is indirectly related to it is studied only in its leading principles and relations; but in such manner that the spare time of the officer in actual service may be utilized in the attainment of thorough familiarity. No ordinary young man can graduate at West Point.

Strangers are not permitted to enter the rooms while the sections are reciting, unless their object be one connected with the public good, in which case they are sure to receive kindly and polite consideration.

REUNION IN HEAVEN.

TEN thousand times ten thousand,
In sparkling raiment bright,
The armies of the ransomed saints
Throng up the steeps of light;
'T is finished—all is finished;
Their fight with death and sin;
They open wide the golden gates,
And let the victor in.

What rush of hallelujahs
Fills all the earth and sky!
What ringing of a thousand harps
Bespeaks the triumph nigh!
O day, for which creation
And all its tribes were made:
O joy, for all its former woes
A thousand-fold repaid!

O then what raptured greetings
On Canaan's happy shore!
What knitting severed friendships up,
Where partings are no more!
Then eyes with joy shall sparkle,
That brimmed with tears of late;
Orphans, no longer fatherless,
Nor widows desolate.

THE WORDS OF JESUS ON THE CROSS.

PART I.

ON the cross uplifted high
Jesus hangs 'twixt earth and sky,
Left by heaven, by earth cast out,
With a cold, derisive shout—
Bearing meekly all that storm,
Visage marr'd and bruisèd form,
Arms outstretched and thorn-crowned brow.
Owned as king of sorrows now.

Then the Savior's voice was heard,
"O forgive them," his first word,
As he poured from piercèd hands
Payment of the Law's demands.
Lord forgive *us;* on our head
Be the blood that then was shed,
On our souls be sprinkled free
Balsam from that healing Tree.

To the sufferer at his side
Asking mercy, he replied,
"Verily to-day with me
Thou in Paradise shalt be."
Lord, in patience let us bear
Pain with thee and daily care,
Till upon our dying eyes
Gleam the palms of Paradise.

Hear him now bespeak love's care
For his mother standing there;
Though a world's sin crushed his heart,
He would do a true son's part.
Like the Holy Child may we
Honor in subjection see,
And with ready succor cheer
Gray hairs of our parents dear.

Lord, beneath thy cross we bow,
Send thy blessing on us now;
May we learn from thee to show
Filial piety below;
Grant to our dim, earthly eyes
Some sweet glimpse of Paradise;
Let us hear thy gracious voice,
"Pardoned sinner, rise, rejoice!"

PART II.

To the darkened noonday sky
Rises a mysterious cry,
"O my God," his piteous plea,
"Why hast thou forsaken me?"
Lord, thy goodness we adore,
Which for us such darkness bore,
That the light of heaven's own day
Might illumine all our way.

Hark! a sad "I thirst" is wrung
From his patient, parchèd tongue,
While the bitter-laden reed
Mocks once more his mortal need.
Lord, thou hast not borne in vain
Thirst and hunger, shame and pain;
In thy woe our weal is found,
We have all things and abound.

Listen, heaven and earth are stirred;
"It is finished," mighty word,
Rends the awful veil in twain,
God and man may meet again.
Lord, with boldness we draw near,
In our hands a title clear,
On our souls a garment meet,
Christ's own righteousness complete.

Then his sacred head he bowed,
And with utterance calm and loud,
"Father, unto thee," he cried,
"I commend my soul," and died.
Lord, we know in whom we trust,
Thou hast formed us from the dust,
Bought us with a price divine—
Living, dying, keep us thine.

Lord, beneath thy cross we bow,
Send thy blessing on us now;
Bid our darkness roll away,
Our immortal thirst allay.
Clothe us with thy raiment white,
Lead us to the land of light;
From the cross, O Lord, look down,
Raise us, fit us for the crown!

AMERICAN ART.

WE reckon ordinarily five great branches of the fine arts—architecture, sculpture, painting, poetry, and music. We should distinguish, however, between those which do or do not address themselves to the eye. Only the first three are, in such a classification, the fine arts proper, and appeal strictly to the ideal alone in man. They only can embody an impassioned expression of emotional impulse, addressing the moral sense through the sensibility and finding the means for this in the visible commonplace of every-day life. In poetry and music the intellect works with the heart, but in the other branches of the fine arts the feelings, the impulses, the passions are at the root, even as they are the moving, underlying energies of life itself. Of the three which address themselves to the eye, the last and fullest form is painting, and it owes its highest development to Christianity.

So long as man worshiped only man, painting had little of the ideal to call out; so long as the gods were only perfect men rendered immortal by beauty, sculpture was necessarily the dominant art. How could painting display its brilliancy and eloquence when nature, which contains in itself the treasury of light, and in its treasury all the colors of the palette, was wanting to its representations? Those beautiful realities, the rivers, the mountains, the trees, and the flowers, the infinite heaven, the immense sea, were represented only by human forms. The earth was a woman crowned with towers; the ocean and its depths were figured by a boisterous god, followed by tritons and nereids; its roaring was only the sound of marine shells, blown by half-human monsters. The bark of the oak concealed the modest hamadryad, the green prairie was a couchant nymph, and Spring herself bore the name and tunic of a young girl.

The new religion which has placed beauty of soul above that of the body has made painting the art *par excellence*. America, which claims for itself the right of purest worship in this religion, from the first opened wide its doors to this one of the muses, and annexed to the domains of our intelligence the beautiful province in which flourish the gardens of the ideal.

The first easel was set up in the colonies a little more than a hundred and fifty years ago. It was brought here by a Scotchman, John Watson, who settled at Perth Amboy as a portrait painter in 1715. This is all we know of the beginning of American art. None of the work done by this first artist of our continent is now known to be extant. Another Scotchman who settled in Boston in 1728 was the next representative of American art. He was a much more aspiring artist, and really enjoyed quite a reputation as a student of the fine arts. His name was John Smybert. He came hither with Bishop (then Dean) Berkeley to take the professorship in this department in a university which the learned ecclesiastic hoped to establish in America, but finally abandoned. Smybert had spent about three years in Italy copying the works of Raphael, Titian, and Vandyke, and others. Copies of these great masters which Smybert produced in this country became a source of inspiration to Copley, Trumbull, and Allston, than whom the first period of American art produced no greater ones.

The first of these master workmen England took from us soon after he attained to fame and never gave him back again. His greatest work in art treated of the "Death of Lord Chatham," and his heir to fame in English history was a son of his who, as Lord Lyndhurst, became one of the chancellors of England. John Singleton Copley was inferior to Benjamin West, but then we have stopped claiming West any longer as an American painter. He is so thoroughly identified with English art, and is so great a character in the period to which he belongs, and the English so accustomed never to yield up what has ever reached them, that Americans have learned to count out Benjamin West, and to say only at the mention of his name: "The American Colonies were

made up of a rude people, but they furnished England's George III his best painter, General Wolfe a canvas of immortality, and the Royal Academy of London one of its most illustrious presidents in the second half of last century."

To Copley and West we are indebted for Trumbull, who bore the surname of his father, John, the well-known first governor of Connecticut. Young Trumbull became early interested in art. His real inspiration he drew from Copley on a visit which he made to him shortly after his marriage. The great artist's attire, a suit of crimson velvet with gold buttons, his elegance of style, and the general distinction in which he was held by every body made a deep impression on the astonished youth and filled him with a love for such a life. Going abroad, Trumbull studied under West, and finished several of his greatest works under the eye of England's great American painter. Many of Trumbull's later and independent productions betray an originality and force that stamp him as an artist of first rank, and make the early period of American painting reputable by reason of his connection with it.

Washington Allston, the intimate friend and companion for many years of Coleridge and Irving, and the brother-in-law of Channing, gained for himself a position on both sides of the Atlantic, obtained prizes in Great Britain, and held membership in the London Royal Academy.

A great deal of fun is enjoyed at the expense of those who dare speak of an early American school of art, and yet we are not of those who are prepared to abrogate that excellence in our maturer art which as a most competent American art critic* has recently said, "is hardly surpassed in certain particulars by the art of any contemporary people." Allston's "Spalatro" and Trumbull's "Death of Warren" and "Death of Montgomery" are not excelled any where for impressive action, dramatic interest, absorbed natural expression of feature under strong emotion, on a plane quite superior to that of the merely picturesque. They are conceived with a certain elevation of thought, just conception of character, and true regard for spontaneity of action, which is very unusual, and quite unsurpassed in recent art.

In technical qualities, also, these pictures are surprisingly skillful. We have had likewise portraits by Stuart, Elliot, Page, Furness, Hunt, and Huntington which would command attention and respect in any *salon;* while in landscapes there have been individual works by Cole, Inness, Gifford, Church, M'Entee, Coleman, and others which have not their superior in this branch of art, marked by decided individuality, grandeur of conception, and adequate thoroughness of rendering, which will place them permanently where they belong, only to be surpassed by a profounder genius than has yet inspired contemporaneous landscape art. We do not mean to say that these artists are always equal, or that even their individual representative works are above criticism; we do not mean that they are faultless, mature, and adequate in every technical quality—for they are not; indeed, in every one of them we might point out conspicuous faults, inadequacies, want of skill. Faultlessness of execution is not the highest end of art. The compensation rests in their aim and in their power to move the sensibilities effectively and naturally; while it would be difficult to conceive of wider diversity of style and greater individuality of methods than their works suggest. But these older artists have not been without their successors, and to-day we may safely say that, notwithstanding the influences of the Munich and Paris schools upon our younger generation of artists, American art has maintained a very distinct and honorable position in the domain of art. We are gratified to see American society recognize this fact. There is at present a general art manifestation amongst us. In a thousand different ways it has found expression. It has gone even far beyond the lines of the fine arts. We begin to adorn our furniture, collect and elaborate our china-ware, and are carrying the application of art into our various industries.

* Professor Weir, of the Yale College School of Art.

SILENUS.

The very spirit of the times is for the artistic. This love for the beautiful has called out innumerable publications. We are beginning to classify what we have, and to criticise their relative values with what reaches us from abroad and what we encounter when away from home. Time was when a picture coming from Europe was given superiority simply because it was not the work of one of our own artists, but the cultivation of the critical art faculty by publications and schools of art has at last given us a just appreciation of our own accomplishments. We are told that two professors at Syracuse University who have pursued art studies for years and have attained an enviable position as art critics have completely revolutionized the taste of the city in which they live. The very decoration of Syracuse homes has changed character. If so much can be done by two men in one city, what will not be done by the general circulation of such books as Lübke's "History of Art," edited and enriched by Clarence Cook (New York, Dodd, Mead & Co., 1878, 2 vols.); Radcliffe's "Schools and Masters of Painting" (New York, D. Appleton & Co., 1877); Benjamin's "Contemporary Art in Europe" (New York, Harper & Brothers, 1877); Huntington's "Manual of the Fine Arts" (New York, A. S. Barnes & Co., 1879), and lastly but especially by Sheldon's "American Painters" (New York, D. Appleton & Co., 1879), enriched by eighty-three engravings, executed by the very masters in engraving, Messrs. Linton, Moore, Harley, Anthony, Bobbett and Filmer?

The Elians built a studio for Phidias in the court of the temple of Jupiter, and all Greece worshiped a statue chiseled by that illustrious man. Even the gods were connoisseurs of art; once, in answer to a sculptor's prayer for a token of approval, they flashed lightning from a clear sky across his feet. Will these good old times ever return? Do we care to see them back again? In England, not long ago, the very words "fine arts" are said to have called up a notion of frivolity, of great pains expended upon small things—things that gave fops an opportunity of pluming themselves on their sagacity and capacity; while in America the Puritans used vehemently to exorcise what, in their eyes, were not the Muses, but the devils of painting, music, and architecture. "This is a plastered, rotten world," said one of their spokesmen. "The creation is now an old rotten house," exclaimed another. What mockery, then, to address one's self to the cultivation of the beautiful! What folly to embellish an existence, the cherished symbols of which are sackcloth and ashes! Those days, of course, nobody yearns to see again, nor is there the faintest prospect that they will return. The Anglo-Saxon spirit, at least, is neither classic nor iconoclastic, neither Greek nor Puritan. In art matters it takes a middle ground, and its admonitions are those of Lessing to his friend Mendelssohn. "Only a part of our lives must be given up to the study of the beautiful; we must practice ourselves in weightier matters before we die."

Yet how wholesome a part is that which is spent in the service of art, and how great are the obligations of civilization to art! If, as some one has said, force and right are the governors of the world—force, until right is ready—how large has been the force of beauty when expressed by the poet and the painter! With each new epoch of development come fresh revelations of it in man and in nature—revelations which art alone is competent to disclose, and healthy sensibilities and vigorous intellects alone are able to appreciate. A thing of beauty is a joy forever; not because beauty is lovely in itself, nor yet because it educates and elevates the feelings, but because it is simply the splendor of the true; because, in the words of Goethe, it is a manifestation of the secret laws of nature, which, but for this manifestation, had been forever concealed from us.

The fine arts, therefore, concerned solely as they are with the expression of the beautiful, have a very serious reason for existence; and painting, which reveals to us the mysteries and potencies of color, is the noblest of them all.

Next to seeing a great picture is a perfect engraving of it. Photographers have also done service, but, after all, if we can not

have the effect of color which so peculiarly distinguishes a painting from every other work of art, we prefer a master workman's engraving to instruct us of what we must take at second-hand. The "American Painters" in this respect serves a most admirable purpose, and we have the pleasure of introducing to our readers three of the very best selections from this work. We do not wish to be understood as saying that we take the three painters whose works we have illustrated by engraving to be representative of their class. Modern American art has more than three to single out as its best representatives, but we have chosen them because there is a decided individuality to the works here illustrated and because also they indicate each a stage only in the growth of our art.

We might have written of Daniel Huntington, for so many years the revered president of our National Academy of Design, who has painted probably more portraits of distinguished Americans than any other of our artists living or dead, and illustrated by his "Sowing the Word" and his "Ichabod Crane and Catrina van Tassel" how grandly he succeeded in mingling the historic and the ideal. We might tell of the line of portraiture as followed by Inman and Elliot, whose likenesses are most accurate, expressive, and finished; of William Page, with his rich Venetian coloring, and Healy with his historical and literary characters. We should give space to the few notable compositions by American artists in *genre* and figure painting. But who knows not Chapman's Campagna scenes and his other delightful pictures of Italian studies? And what American has not looked with pride on the works of Freeman, Vedder, Boughton, Gray, and Johnson?

We must confess we feel that we have hardly a right to send out this article without an illustration of one of Eastman Johnson's works. Never can we forget the impression his "Stage Coach" made upon us, as we stood in the passage way of the Art Centennial Building at Philadelphia. The humor so characteristically American, the *naïveté* of the children, the choice of the situation, the drawing of every character and object, the coloring, all combined to rivet us to the spot, and we felt we stood before the work of one of the world's greatest artists. To be sure, the picture is American. Mr. Johnson's subjects are usually taken from American life—from the late war, as in his "Drummer Boy," his "Convalescent Soldier," and his "Pension Claim Agent;" from Southern slavery, as in his "Old Kentucky Home," and "Washington's Kitchen at Mount Vernon;" and from Northern homes and streets in country and city, as in his "Getting Warm," a girl standing by a stove, the "Chimney Sweep," and the "Organ Boy." His pictures are verily presentations of national types. Almost from the very start of his career Johnson's paintings have received wide appreciation and brought him handsome financial returns. Many of them, perhaps the best of them, have the simple, tender characterization, the sweet, serene inspiration that make Edward Frére's *genre* works so pleasing; and almost all of them display a real original power that penetrates and discloses the newness and freshness of common scenes. Mr. Johnson's perception of character is quick and accurate; he does his own thinking, he prefers truth to melodramatic effect, but seldom puts in jeopardy the popularity of a design; he is patient, industrious, and studious, never deficient in feeling or in command over his resources, not always perfect in depth and luminousness of color or tone, but never metallic or coarse. He has a swift, sure sense of composition, and his painting in general is solid and sound.

In the Paris Exhibition of two years ago Eastman Johnson was represented by his "Corn Husking," which received considerable attention, and was acknowledged by French critics as outside of American range on account of its great excellencies. This painting is little more than a sketch, but full of capital suggestions of color and effect. The figures are arranged in two lines, with baskets before them, all busily engaged in husking the Indian corn; the straw makes a golden carpet on which they are relieved. Among the incidents is one of the girl who

finds a red ear of corn, whereby her lover may claim a kiss; in the background is the farm; tables are being spread, poultry forage in the straw—altogether a more cheery scene could not be imagined.

America has really done its best work in landscape art. We possess some of the noblest works of this century. There is a certain snobbishness in New York which often gives precedence to foreign work simply because it is foreign. It may, therefore, be accounted a matter of no small moment when, at the sale of Mr. John Taylor Johnson's art collection—perhaps the finest ever offered here—counting works of Meissonier, Turner, Gérôme, Vernet, Vibert, Schreyer, and a score of other European masters—the first prize was carried off by Frederick Edwin Church, whose "Niagara Falls" brought twelve thousand five hundred dollars. Asked on one occasion what was his method of work, and his views of the nature and the ends of art, Mr. Church replied that he had always been a faithful student of nature, and that this was the only answer he could give to such questions. So far, indeed, as his methods of work were concerned, he had never looked upon himself as having any; and the question suggested the matter to him for the first time. His pictures, however, answer the question if he can not. In the first place they tell us that, like Sir Joshua Reynolds, he sees little beauty in common things, and depends largely upon the external splendor of his subject. His instincts, in a word, are tropical; and in the gorgeousness and magnificence of the tropics he has found the themes that please him best. Outside of the tropics his subjects are still gorgeous and magnificent—the Falls of Niagara, with rainbow accompaniment; the iridescent and majestic icebergs off the coast of Labrador; the glorious Parthenon, in a blaze of light and in an atmosphere unrivaled; the city of Jerusalem, beneath the Syrian skies. And even when in the tropics his fondness for wealth and brilliancy of scene leads him, as in his famous picture, "The Heart of the Andes," to make artificial combinations of the mightiest mountains, the most picturesque valleys, the richest vegetation, the lordliest trees, the most sparkling water, the gaudiest birds and flowers, and the most enchanting perspectives: so that one is reminded of Sir Philip Sidney's saying, "The world is a brazen world, the poets alone deliver a golden; nature never set forth the earth in so rich a tapestry as divers poets have done, neither with so pleasant rivers, fruitful trees, sweet-smelling flowers, and whatsoever may make the earth more lovely." Where landscapes are the stateliest and the most radiant, there Mr. Church's brush is eager to be at work; but it is most eager when the artist has selected from a wide range of objects, fair, bright, and grand, those which are especially fair, bright, and grand, and made of them a single composition. A student of nature Mr. Church is undoubtedly; he is also an indefatigable student of the resources of his pencil and his palette. He draws with remarkable accuracy, and has mastered not a few of the harmonies and the glories of color. Yet he has been trained in no European nor American school. Thomas Cole, the father of American art, whose name is and will be held in reverential and living remembrance, taught Church the fundamental technics of his art; and the pupil's persevering industry and singleness of purpose took up the task where Cole left off.

If Church is most successful, Bierstadt deserves to stand next because he is best known. There is no American artist of our times whose works have been more widely discussed. Seventeen years ago at the great fair of the Sanitary Commission, in New York City, Bierstadt's "Rocky Mountains" and Church's "Heart of the Andes" were the principal pictorial attractions. Since then Bierstadt has painted some very fine pictures and some poor ones. A civil war has been in the land, fortunes have been made and wasted; in this period of inflation artists were encouraged by shoddy aristocrats to carry wares to market that had been made simply to satisfy the contract. But now we are once more returned to more solid modes of living, and our great artists are not so much concerned about the princely income their works shall bring as about the

MOUNT CORCORAN, SIERRA NEVADA.

worth they shall embody and the character they shall enjoy. However, Mr. Bierstadt will never have the solid characteristics of Church. He is a believer in Wagner's principle of the value of mere quantity in a work of art. He has painted more large canvases than any other American artist. His style is demonstrative and infused with emotion—he is the Gustave Doré of landscape painting. With Mr. Cross, the English home secretary, he doubtless holds that art from beginning to end is nothing more nor less than imitation—imitation inspired, if not controlled, by veracity, refined by taste, and, we may add, assisted by artifice. With the sculptor, he likes a subject that is noble in itself, and disdains to illumine common things. His "Mount Corcoran, Sierra Nevada," and one of the illustrations of this article, has been described as follows: The peak rises to a height of fourteen thousand eight hundred and eighty-seven feet, and is about five miles distant from the little lake fed by the snows of the mountain range. The picture is considered to be a happy combination of the best points in Mr. Bierstadt's style, and while treated with a bold, broad effect, abounds in finished truthfulness of form and color. The engraving well conveys the impression made by the drawing, but none of the effect of the fine local and aerial color in the rolling mass of clouds, the gigantic trees, the exquisite green depths of the water, into which recede the submerged rocks and trees of the foreground, and the yellow curve of the shore dotted with the scarlet dwarf-willows. From the somber skirts of the storm-clouds sweeping down the mountain gorge, leaps a glittering cascade that is mirrored by a trail of light in the lake. The sentiment of wild, solemn solitude, blended with a beauty not too intrusive, is heightened by the figure of a black bear crossing the beach for a bath or a drink. The picture is five feet by eight, and occupies a prominent position in the Corcoran gallery at Washington.

One of Mr. Bierstadt's earliest works is a street scene in Rome, painted in 1853, and hanging in the Boston Art Museum. It is rich in color, skillful in composition, and simple in design. Its greeting surprises the visitor who has known Mr. Bierstadt through his great western landscapes only. But these landscapes it is that has made the artist's reputation. Especially in England have they been praised and prized, and for the reason, perhaps, among others, that they describe to a people, fonder than all others of travel and books of travel, the novel and majestic beauty of our vast Territories. When the "Storm in the Rocky Mountains" was on exhibition in London, a leading review of that city was enthusiastic in the recital of its merits. "We are somewhere," it said, "in the heart of the Rocky Mountains, at a height of a few hundred feet from the level of the lake below us. This lake, which is small and very beautiful, receives a stream from another lake on a considerably higher level, and at a distance of several miles. Over the distant lake broods an immense mass of dark storm-clouds, which attracts our attention because it is so terrible, and, toward its toppling summits, so elaborate. In the middle distance the rocky barrier between the two lakes rises to a great elevation at the right, and a still nearer mass, also to the right, fills the field of vision in that direction. Near a little pool and on the sloping pasture-land in the foreground are groups of many trees, and an alluvial plain near the lake is watered by a winding river on whose banks grow beautiful clusters of wood. The qualities which strike us in Mr. Bierstadt as an artist are, first, a great audacity, justified by perfect ability to accomplish all that he intends. He is not a mere copyist of nature, but an artist, having definite artistic intentions, and carrying them out with care and resolution. . . . He is always trying for luminous gradations and useful oppositions, and he reaches what he tries for. The excess of his effort after these things may be repugnant to some critics, because it is so obvious, and seems incompatible with the simplicity and self-oblivion of the highest artist natures. We believe, however, that in art of this kind, where the object is to produce a powerful impression of overwhelming natural grandeur, a painter must employ all the resources possible to

him. This may be condemned as scene-painting, but it is very magnificent scene-painting, and we should only be too happy to see more of the same kind."

The American master in aerial perspective is undoubtedly Sanford R. Gifford. We wish we could here give an illustration of his "Coming Storm," "Morning in the Mountains," or his "Sunset in the Adirondacks." With Mr. Gifford landscape painting is air painting, and his endeavor is to imitate the color of the air, to use the oppositions of light and dark and color that he sees before him. If the forms are represented as they are in nature under atmospheric conditions of light, dark, and color, these forms will look as they look in nature, and will produce the same effect. Thus much, perhaps, Mr. Gifford believes in common with every educated artist. But every artist has his own particular method of work. Mr. Gifford's method is this: When he sees any thing which vividly impresses him, and which, therefore, he wishes to reproduce, he makes a little sketch of it in pencil on a card about as large as an ordinary visiting-card. It takes him, say half a minute to make it; but there is the idea of the future picture fixed as firmly if not as fully as in the completed work itself. While traveling he can in this way lay up a good stock of material for future use. The next step is to make a large sketch, this time in oil, where what has already been done in black and white is repeated in color. To this sketch, which is about twelve inches by eight, he devotes an hour or two. It serves the purpose of defining to him just what he wants to do, and of fixing it in enduring material. Sometimes the sketch is not successful, and is thrown aside to make room for another. It helps him also to decide what he does not want to do. He experiments with it, puts in or leaves out, according as he finds that he can increase or perfect his idea. When satisfactorily finished it is a model in miniature of what he proposes to do. He is now ready to paint the picture itself. All that he asks for is a favorable day on which to begin. To Mr. Gifford this first day is a great day. He waits for it, he prepares for it. He wishes to be in the best possible physical condition. He is careful about his food, he is careful to husband his resources. When the day comes he begins work just after sunrise, and continues until just before sunset. Ten, eleven, twelve consecutive hours, according to the season of the year, are occupied in the first great effort to put the scene on canvas. He feels fresh and eager. His studio door is locked. Nothing is allowed to interrupt him. His luncheon taken in his studio, consists of a cup of coffee and a piece of bread. His inspiration is at fever-heat, every faculty is stretched to its utmost, his brush moves rapidly, almost carelessly. He does not stop to criticise his work. The divine afflatus is within him, and he does unquestioningly whatever it tells him to do, while his pigments are wet and in movable condition.

The first thing that Mr. Gifford paints when producing a landscape is the horizon of the sky; and his reason for doing so is, that in landscape painting the color of the sky is the key-note of the picture, that is to say, it governs the impression, determining whether the impression shall be gay or grave, lively or severe; so much so, indeed, that landscape painting may be called (what we have already said Mr. Gifford calls it) air painting. Different conditions of the air produce different impressions upon the mind, making us feel sad or glad, or awed or what not. Hence, the condition — that is, the color—of the air is the one essential thing to be attended to in landscape painting. If the painter misses that he misses every thing. Now, the color of the sky at the horizon is the key-note of the color of the air. Mr. Gifford, therefore, begins with the horizon. When the long day is finished, and the picture is produced, the work of criticism, of correction, of completion is in place. Mr. Gifford does this work slowly. He likes to keep his picture in his studio as long as possible. He believes in the Horatian maxim of the seven years' fixing of a poem. Sometimes he does not touch the canvas for months after his first criticism has been executed. Then suddenly he sees something that will help it along. A friend

remembers hearing him say one day in his studio: "I thought that picture was done half a dozen times. It certainly might have been called finished six months ago; I was working at it all day yesterday."

Mr. Gifford varnishes the finished picture so many times with boiled oil or some other semi-transparent or translucent substance, that a veil is made between the canvas and the spectator's eye—a veil which corresponds to the natural veil of the atmosphere. The farther off an object is in nature, the denser is the veil through which we see it. And this veil is different at different times. One day we go out in the morning and looking up and down the street take no note of the sight. We are not impressed. Another day there is a slight change in the density or the clarity of the atmosphere, and lo! what before was a commonplace view has become exquisitely beautiful. It was the change in the air that made the change in the object; and especially when finishing his picture does the artist bear in mind this fact. Moreover, as the spectator looks through this veil of varnish, the light is reflected and refracted just as it is through the atmosphere, reflections and refractions which, though unseen, are nevertheless felt. The surface of the picture, therefore, ceases to be opaque, it becomes transparent, and we look through it upon and into the scene beyond. In a word, the process of the artist is the process of nature. Mr. Gifford's industry often leads him to make a dozen sketches of the same scene. The first sketch, indeed, contains the essence; but day after day he visits the place, corrects the first sketch, qualifies it, establishes the relations of one part to another, and fixes the varied gradations of color. His portfolios are heavy with studies of rocks, of trees, of fallen leaves, of streams, of ocean waves. Some painters think that if they reproduce such objects exactly, they lose some of the poetry of natural facts. Mr. Gifford does not think so. He believes in nature, and is not ashamed laboriously to imitate her. An artist like Corot offends him by slovenliness. To him one of Corot's finished landscapes is scarcely more than a sketch. He gets from it nothing more than he would get from a drawing. "The best thing by Corot that I ever saw," said Mr. Gifford one day, "was a lithograph after one of his pictures." On the other hand, every critic knows that Mr. Gifford does not elaborate unnecessarily or so as to draw attention to the mechanism of the work, simply as mechanism. That were a fault almost as bad as the worst. Nor is Mr. Gifford disposed wantonly to sport with color, to show it off merely as color and nothing else.

In one breath with Gifford a master should be mentioned who is of an older day, we mean, of course, John Frederick Kensett. He is classed usually with the more modern school of our art, and his brush is no longer in his hand, and his hand no longer moves; but his works remain to attest to a devotedness to art and a respect for the dignity of his calling. His pictures reflected his character. Any one who has looked after American art at all is acquainted with Kensett's "Sunset in the Adirondacks," "Franconia Mountains," and "Hudson River from Fort Putnam." These works are full of tenderness and pathos, if they are landscapes, and there is a grace and charm of manner in his art which inspires reverie. His aim was absorbed in those simple, pastoral truths of nature which require for their right expression, delicate feeling, and a sensitive touch.

The painter of American painters in landscape is, to our fancy, George Inness. He is a thinker, and has spent time to consider deeply the philosophy of his art. His early education he owes to Gignoux, a French landscape painter who came to this country in 1840, and produced notable works on American scenery and gained quite an enviable repute as an artist. The greatest influence was exerted over Inness, not, however, by Gignoux, but by Durand, another of our very best artists, classical in his attainments, but not so prolific in production as his scholar, nor as true to nature. Durand's aim is not actual representation, but compositions arranged and selected so as to produce special impressions. In early life he was an engraver. He engraved for

THE TONING OF THE BELL.

Trumbull his painting "The Declaration of Independence," which task cost Durand six years, but brought him national fame. Ever since he has been loved as a man and admired as an artist. William Cullen Bryant was a very warm friend of Asher Brown Durand, and the author of "Thanatopsis" often expressed his feeling of kinship with this painter of American woodland. Inness's reputation as an artist is not over two decades old, and his principal work the result of only yesterday, so to speak. The last three years have brought him into general notice, and to-day he is probably the man who promises to accomplish most in his line of American art. His "Homestead," which he brought out in 1877, is undoubtedly one of the best works ever done by his brush. It is especially noteworthy for its elaboration and for its perfection of natural quality. The texture of the grass in the foreground and the fullness and harmony of local color are wonderfully true to nature. These traits are characteristic of his landscapes. He is an admirer of Thomas Rousseau, the great French painter, who, together with Claude Lorraine and Jean Baptiste Camille Corot, form, the trio of highest excellence yet reached in French landscape art. These Frenchmen totally different one from the other, are one in this, that they were agreed in looking at nature not only for what she seems to the visual eye, but still more what she suggests to the soul. "They were men," says Benjamin, "endowed not only with exquisite keenness of vision in detecting the harmonies of the visible world, delicate perception of chromatic effects and technical ability, but they were also men of thought, of imagination, of vast poetic feeling." Inness, like Rousseau, uses nature's form simply as language to express thought. His nature is deeply a religious one. "When painting he always feels," says Sheldon, "that there is a power behind him teaching him, not, indeed, how to paint, but what is truth, what is the significance of things." "The whole effort and aim of the true artist," said Inness one day, "is to eschew whatever is individual, whatever is the result of the influence of his own evil nature, of his own carnal lusts, and to acknowledge nothing but the inspiration that comes from truth and goodness, or the divine principle within him, nothing but the one personality or God, who is the center of man and the source of all noble inspiration. For just as it is impossible for him to personalize nature on his canvas, so is it impossible for him truly to personalize himself. Like every other man the artist is an individual representation of a personality, which is God. This personality is every-where to be loved and reverenced; but the assumption of it to self is the creation in man of his own misery; the subjection of himself to insults, to distresses, to a general disagreement with all the conditions of his existence. By eschewing it as belonging to himself, he learns to love and to reverence it as represented in truth and good every-where; that truth and good are God, existing from the beginning, one with the beginning, creating all things. I would not give a fig for art ideas except as they represent what I perceive behind them; and I love to think most of what I, in common with all men, need most—the good of our practice in the art of life. Rivers, streams, the rippling brook, the hillside, the sky, clouds—all things that we see—will convey the sentiment of the highest art if we are in the love of God and the desire of truth."

In marines we have as yet but fairly begun. William Bradford is one of the oldest and best in this line. His favorite subjects are coast views, rocky shores, and icebergs. His chief pictures are "Hailing the Sloop in Martha's Vineyard," "Light-house in St. John's Harbor," and "The Coast of Labrador." Mauritz Frederick De Haas is, however, no doubt, our best artist of his class. Yet he is neither broad nor minute. He ignores wholly all principles of art critics and takes nature as his only guide. And besides he is not an American but a Dutchman domiciled here. Of course, we are glad to claim him, but he is not to the manner born. We were in his study and saw him at work on his "Coast of France," which he exhibited at New York in 1877,

and which has since gained much favor. It is engraved and described in Appleton, a work to which we have already had occasion to refer so favorably. Mr. De Haas has painted scores of pictures, the composition of which is not at all dissimilar. On the right are the chalky cliffs, the stony shore, the sailing vessels stranded at low tide; in the middle distance is a row-boat full of sturdy watermen, beyond whom stretches a smooth expanse of sea illumined by the glory of the setting sun. The listless, lazy waves that creep along the coast are in a full blaze of light, which beats against the sail and side of the principal fishing smack, and bathes the cliffs in a tender radiance. One of the sailors has built a fire on the shore, and will soon welcome his fellows, who are approaching in the small boat. "Long Island Sound by Moonlight," also engraved, is more picturesque. A brig, under very nearly full sail, just passed between the light-house and the shore, is clearing the shimmering water amid the refulgence of a moon that has not yet begun to wane. The sky is peculiarly varied and beautiful. The position and the rigging of the vessel would, doubtless, be satisfactory to the eyes of a sailor; the water looks like real water, and the quality of the whole is brilliant and pure. So far as familiarity with the appearance and handling of a ship are concerned, Mr. De Haas has no superior in the studios of this country. "The great charm of marine painting," Mr. De Haas says, "consists in the fact that every cloud of any size affects the color of the water, so that what you see is rather sky-reflection than the real color of the water, except, of course, in the immediate foreground. Wind also comes in and changes the color. On the surface of a lake when there is no wind and no motion, the sky is perfectly mirrored. I have seen instances where you could hardly tell which was sky and which was lake. The reflection was complete both in color and shape. Since waves never exactly repeat themselves, I watch the appearance of just such a wave as I wish to represent, draw it at once, and take its color from a second wave. Only after long experience will the drawing be successful, and even then the correct aspect of a wave is hard to get. Waves in deep water have one distinctive aspect, waves in soundings another, waves along shore another. In mid-ocean, for instance, they are rounder and hill-like; near the land they become sharp and broken up. As for color in deep water they are a dark, inky blue, difficult to describe because it varies with the appearance of the sky, while toward soundings they become greenish, and nearer the shore green where the coast is rocky, and yellowish where it is sandy. Waves in deep water are always the most difficult for me to paint; the motions of those on the coast are much more distinct and regular. I have, and always have had, a special fancy for moonlight scenes; the oftener I see them the more I am impressed by them. The moonlight scenes in and near New York are, I think, finer than in any other locality, except, perhaps, on the ocean. They are more luminous, more highly colored, and more atmospheric than in Europe. The cloud-scenery in the suburbs of New York is the noblest and most beautiful in the world."

Animal painting is another branch of art in which America has made some progress. To be sure, our artists in this line are few, and their works modest. But we have made a grand, good beginning. James M'Dougall Hart is probably our best representative as yet. His landscapes are works of worth, but his excellence is in his cattle. To appreciate Hart we must see him in his pictures. And let us hear his own words concerning the motive of them: "I strive," he remarked one day, "to reproduce in my landscapes the feeling produced by the original scenes themselves. That is what I try for, only that and just that. In this painting, for instance," pointing to one near him, "I aimed at the lazy, listless influence of an Indian Summer-day. If the painting were perfect you would feel precisely as you feel when contemplating such a scene in nature. In that painting," indicating another one, "I strove for the effect of a Midsummer color; in the next one for the impression made by the Autumn woods when you walk

in them and the dry branches crackle under your feet. A business man, while looking at one of my landscapes—it was my 'Under the Elms'—said, 'That picture rests me; a sensation of rest steals all over me when I look at it.' That is precisely what I have striven after." Here there are no "symphonies," or "nocturnes" or "variations" or "arrangements" of color, and no improvements upon nature, but utmost simplicity and singleness of purpose; the attempt to make a canvas do exactly what nature does. This artist's art undertakes to act upon our sensibilities as do real scenes of beauty in the external world. If some of these divert and cheer us, so would he have them do in his pictures; if some of these rest and quiet us, so would he have them do in his pictures; if others instruct and lift us up, so would he have them do in his pictures. It has been said of Millet that he tried to render all the phases through which nature passed; to paint not only the impressions of the seasons, the temperature, the outer coverings of things—"the clods of earth, the tufts of heath in a vast plain, the soil saturated by the rain, and covered with hoar-frost"—but also to reproduce phenomena as intangible and occult as the miasma in the air. With Mr. Hart, however, the purpose is simpler and the result surer. He knows his limitations much better than his critics do, and wisely never ventures beyond them.

In 1871, after painting his "Under the Elms," Mr. Hart began to feel the need of a thorough acquaintance with cattle. He went out-doors and began to study them. He found them worth studying. Perhaps no artist in this country better appreciates the nature and the merits of oxen, or would better understand Mr. Hamerton's enthusiastic eulogy of them: "Who that has seen these creatures work can be indifferent to the steadfast grandeur of their nature? They have no petulance, no hurry, no nervous excitability; but they will bear the yoke upon their necks and the thongs about their horns, and push forward without flinching from sunrise until dusk. I hear, as I write, the cry of the ox-drivers—incessant, musical, monotonous. I hear it, not in imagination, but coming to my open window from the fields. The morning is fresh and pure, the scene is wide and fair, and the Autumn sunshine filters through an expanse of broken, silvery cloud. They are plowing not far off with two teams of six oxen each—white oxen of the noble Charolais breed, sleek, powerful beasts, whose moving muscles show under their skins like the muscles of trained athletes. The first condition of success in animal painting is, as the French say, to *possess* your animal. You can not paint an animal in movement until you know him by heart; you must know his structure, the places of his bones and muscles, and the markings caused by every change of attitude; you must even know more than this; the mind and character of the animal must be familiar to you, and more than familiar—friendly. The amount of knowledge and of gentle, condescending sympathy (a condescension of which only fine minds are capable) which is necessary to the painting even of a calf, is little dreamed of by persons of exclusively literary culture, who too often conclude that, because the calf himself has not much intellect or information, it does not require much of either to paint him. This comparison between the intellect of the subject and the intellect necessary to grasp the subject, has been the cause of a very curious old illusion. Figure-painters have imagined that because man is a more intelligent animal than the ass—which in exceptional cases is undoubtedly true—the painter who respresents men is superior in the same degree to the painter who represents asses. They do not consider that by the mere fact of our human nature we have easy access to all human nature that resembles our own; whereas to go out of our humanity so as to enter fully into the existence of the inferior animals requires either great effort of imagination, or the most comprehensive sympathy. Children and childish painters solve the difficulty in a very simple way by attributing human sentiments to animals; and as the public easily enters into such human sentiment, it applauds them, without too nicely considering how far they have studied the true character of brutes." Mr. Hart, however, never

lends himself to the perpetration of so easy an untruth. For cows and oxen he has the fullest sympathy. Their thoughts, which are not men's thoughts; their ways which are not men's ways, and their faces, which do not depend for interest upon any human likeness or suggestion, have been the objects of his studious love.

Frederick A. Bridgman, comparatively a young man, yet has attained suddenly to great notoriety at home and abroad. In Paris he obtained a third-class medal in the *salon* of 1877 and an award of praise unusual for an American work. His contribution to the *salon* last year was an Assyrian king killing lions in the amphitheater. He is not confined in his strength to the animals, but has excellencies in many ways. He is versatile and indicates genius.

In domestic animals James H. Beard, now pretty well advanced in years (he was born in 1814) is our representative. He has studied the cat's and dog's nature, and has given us in his pictures these animals as we find them about us in life. His painting "The Mourners" is celebrated.

Peter Moran is yet a young man, but he too promises to earn for himself a name and fame in the work for which Troyon and Rosa Bonheur are now synonyms of excellence in their line of art.

The American painter in whom we recognize our beau-ideal of animal painting is William H. Beard. He is most widely known as a humorous painter of bears and monkeys. But who ever saw his "March of Silenus" and did not recognize in every feature of that great painting the artistic promise of a great genius? To be sure Mr. Beard is already in the full strength of manhood (he is now fifty-five years old), but we hope for still greater things than he has already done. There is growth in that artist. We had the good fortune to obtain from Messrs. Appleton the engraving of Beard's "Silenus," and are quite sure our readers will thank us for the insertion in this place. It is one of Mr. Beard's characteristic pictures. Silenus is a great, fat, drunken grizzly bear, followed by goats as satyrs, and other bears as bacchanalians, all of them treated in classic style with a rich warm tone. The expressions of the several faces are worth noticing and the sense of inebriated revelry is strong and single. The conception has real dramatic force; there is originality in the whole cast, strength of representation, accuracy of draughtmanship. Mr. Beard is not well enough known. He deserves a wider fame. He has the characteristics of Landseer.

He is, however, less limited in his field of labor and shows equal strength in any other he has ever touched. His picture, recently sold in the Latham collection in New York, and entitled "The Runaway Match," is a very adequate representative of his most popular style. The runaways are a pair of monkeys dressed gaudily, after the fashion of some country folk, and standing before a monkey parson who is making an inspection of them in the presence of several monkey witnesses similarly attired, before forging the matrimonial bonds. In this picture, as in most of his livelier works, his design is to express character by the use of satire rather than of caricature; and in all his pictures he attains this end by telling a story. The literary instinct predominates, as, indeed, it usually does in American and in English figure-painting. When you look at one of Beard's representations you occupy yourself in reading what he has narrated, and so good is his command of the pictorial syntax and vocabulary that his meaning is always clear. Cruikshank himself is not more easily understood. The subject is the first thing and the chief thing. Perfection of materials and of methods, subtle harmonies of forms, movements and hues, combinations and contrasts of lines and of color, the poetry of pigment and the mechanism of finish, are not at all what he thinks most of. The thought is his great concern, the vehicle of thought is of secondary importance.

Successful and many as are his pictures of bears and monkeys, they are, however, to Mr. Beard himself by no means his most satisfactory works. He feels happiest when dealing with themes like "Old King Cole," "Four and Twenty Blackbirds," and other familiar nursery rhymes, where the imagi-

nation has an easy chance to give a fantastic turn to ideas, thereby exciting merriment and perhaps laughter. But Mr. Beard is serious as well as amusing. In truth, the most conspicuous feature of his career is the breadth of its scope. He is a figure-painter, a portrait-painter, a *genre*-painter, a landscape-painter, an animal-painter, and, for aught we know to the contrary, a marine-painter. He paints woodlands, meadows, and rivers; monkeys, bears, sheep, deer, and rabbits; men, women, and sun-burned boys and girls; parlors, kitchens, and bar-rooms; marriages, picnics, and the final destruction of the universe. There is not an American, living or dead, who has transferred to canvas scenes so widely different; and the possibilities of his future are incapable of being soundly estimated even by himself.

There is only one man in all American art whom we would presume to place beside Beard. If we look for greater things from him and hope some day to enroll his name among the most illustrious hundred of our nation, there shall stand beside him Walter Shirlaw. This is a great meed of praise to a young man, but in our estimation he deserves this, first for what he has already done, and then for what his works promise. He is only a young man. He is not so versatile as Beard. Shirlaw succeeds only in figure-painting, but it is just here we stand in greatest need, and he alone promises to supply what is wanting in Homer Johnson, and to be not only a worthy successor to Robert W. Weir, the painter of "Columbus before the Council of Salamanca," and many other historical and religious subjects, and of Huntingdon. Wyatt Eaton is a rival of equal ambition with him, and of some note abroad already, but he bears no comparison after all to Shirlaw. The only man who could properly enter the lists with him is young Weir—John F., the son of the old professor, R. W., at West Point, and himself in charge of the art department at Yale; but even the author of "Casting the Shaft" does not seem to stand much chance beside Walter Shirlaw. Born in 1837, in Paisley, Scotland, Shirlaw was brought to this country two years later, and is, therefore, properly regarded as an American. He was for six years under the influence of Munich art, and his drawing betrays the training of that German school. We first became acquainted with him in the Centennial Exposition. His introduction was the picture with which we introduce him to our readers—"The Toning of the Bell." We stood spell-bound before the picture. We could not think of it as the production of a young artist, making his first claim to recognition. It betrayed some imperfections, but these were not such as we usually find in young efforts. There was too much concentration of means, and too decided manifestation of an artist's feeling for richness of tone and for color values. If we felt ourselves before a Munich painter's work, we also felt a touch of a newer life than flows in the veins of that old school of Germany. The truth is, Shirlaw had not yet wholly freed himself from the influence of his masters, but was striking out merely. It was painted abroad probably. The scene is laid in a Bavarian foundry. A large church bell lies on its side on the ground. A workman leaning over it proceeds to test its sound, while a violinist near by gives the key-note. Several children, introduced into the picture, are greatly interested in the proceedings.

Another work of his, exhibited at the Centennial, Mr. Benjamin has had engraved for his work on American art, published by the Harpers. The name of the painting, while at Philadelphia, was "Feeding the Geese," but the artist has since changed it to "Good Morning." In the Paris Exposition of 1878 Mr. Shirlaw's pictures received more notice than those of any other American, and his own young countrymen artists have given recognition to his genius by honoring him with the presidency of the American Art Association, now called the Society of American Artists, and composed principally of those young artists who have studied in Europe, especially Paris and Munich, though it includes certain older artists who have also studied abroad. With such a man as Shirlaw to lead this young school of art there is reason for enthusiasm and hope in American art.

OUR APPOINTED TIME.

NEVER were words of complaint more excusable than in the case of Job, when he cried out, "O that thou wouldest hide me in the grave, that thou wouldest keep me secret, until thy wrath be past, that thou wouldest appoint me a set time, and remember me!" He was borne down with trials—heavy trials, and wished for a release. He longed even for the grave. There is yet in him the secret hope of some future life, though remote, when the wrath of God shall have passed by.

Every thing that could make life bearable had been taken from him; and every ill that could make death desirable had come upon him. Yet, after Job had given utterance to these words, he seems to have been ashamed of his weakness; he reasons himself into a better, cooler frame—he looks life in the face! His trials, indeed, are felt to be severe, but he humbles himself under the hand of God, who sends them. He encourages himself to bear with his present sorrows and registers his solemn resolution, "All the days of my appointed time will I wait, till my change come."

In this exclamation of the patriarch we observe that he styles our life "a time," it is not an eternity. What, though our conflicts may seem long, they must have an end. Long as the night may last, it must yield, in due course, to the morning. The tide may ebb out till nothing remains, but it must flow again; God has so decreed. Our whole life is, indeed, brief—a mere span—a hand-breadth. "Our light afflictions," as St. Paul calls them, will all be forgotten when the end comes—when once we enter into the joy that is never-ending and overflowing. Let us not then weigh our troubles in the ill-adjusted scales of this poor transient life. We are born for eternity. We shall, indeed, have our struggles, our brief period of toil and conflict; but one hour with our Lord will make amends for all. "I reckon," says Paul, "that the sufferings of this present time are not worthy to be compared with the glory which shall be revealed in us." O, tell this glad truth to every son of sorrow—tell it to every daughter of grief—that life is but "a time."

But Job also calls our life an "appointed time." To Almighty God belong the issues of life and death. He alone can speak the irrevocable word, and call the spirit home. Our pilgrimage has an appointed beginning and an appointed end. In the glass which measures our existence there is not one sand too few, nor one grain too many. "Remember that you will live out, but not outlive, your allotted years." Beyond the boundary line you shall not pass, nor can you add an inch of time to the determined period. Should not this cheer us, that the days and bounds of our habitation are not left to the winds of chance or uncertainty, but appointed by an immutable decree?

Further, Job speaks of "the days" of our appointed time; not merely giving us an additional idea of its littleness, but reminding us that our life is made up of successive periods. It is wise, then, to bear the burden of life in the parcels into which God has divided it, that we should live as life comes, day by day. "As thy days, so shall thy strength be," is the promise. We have no promise for the year. "Give us this day our daily bread," is the petition. We should then live by the day, and work by the day; and, when called to it, suffer by the day, till all our days are over.

But the word here translated "our appointed time" may be read as "our warfare," the period of our enlistment, our hard service. Life is, indeed, a warfare; a service to which you are bound till the period of your enlistment is over. You became soldiers and servants of Christ when first you believed in Jesus. You are now pilgrim warriors on your march to heaven; and as in no part of your journey can you be secure from the enemy, you are ever to be on the defensive, and look upon life as a continued service with the Captain of your salvation.

But what was the resolution or purpose of Job in taking this view of life? "All the days of my appointed time," he says, "will I wait." Now the word "wait" has much meaning. In the first place, it implies patience. It means that the Christian life should be a sitting loose to all earthly things; a patient waiting for better. Christians know this is not their rest, and, therefore, they seek to disentangle themselves as much as possible from the things of this world. They may have to buy and sell in it, but they neither buy nor sell for eternity.

The Christian's treasure is laid up in another place, and his heart is there. He looks upon earthly enjoyments as lent to him—borrowed comforts. If his children sicken and die, he does not wonder; he knew they were not immortal. If friends fail him, if riches make to themselves wings and flee away, he is not taken by surprise. He had long ago learned that the world was "founded upon the floods," and, therefore, when it moves beneath him he does not wonder, since all is waiting to be overturned.

Again the term "wait" implies "expectation;" expecting daily and hourly to be summoned by the Lord. No Christian man should calculate upon having another day: you can not reckon upon an hour. To "die daily" is the business of the believer; yes, it is greatly wise to talk with our last hours; to make ourselves familiar with the appointed end of life. Daily dying would so keep us to godly living. We should not be so grasping if we knew that the heap would soon melt, or that we should be so soon taken from it. We should not attach such importance to trifles if we felt that grander things were within our reach. If we saw our candle flickering in the socket, we should be far more diligent to get much done in a little time. Next to living close to Christ, we do not know a better prescription for overcoming the world than this "dying every day."

But now as to Job's idea of the future. It is expressed in the phrase "till my change come." It is not necessary to discuss how far Job had clear views of the future state, or what is the full meaning of that other saying of his, "I know that my Redeemer liveth, and in my flesh shall I see God." We can read all such sayings in the light of a clearer revelation. "Till my change come." There are two changes which may be here contemplated at a glance: the change at death, and the change at the resurrection. In a certain sense, death and the resurrection are not a change to the Christian. They are not a change as to his identity. The same man who lives here will live forever. The same believer who serves God here on earth will wake up in the image of Christ to serve him forever. Death will not destroy the identity in the resurrection body. There will be a mighty development, but it will still be the same. Nor will there be any change as to the life of the Christian. "He that believeth hath everlasting life." He hath it now; the very life which he is to live in heaven, of course, much more glorious, but still the same.

But, though they are the same, yet there will be a change as to place and circumstances. We shall no more be as strangers in a strange land, but we shall be as children at home in heaven. *There* is no poverty, no proud man's scorn—no oppressor, no persecutor. *There* is no body of death to hamper him, no infirmities to hinder the Christian. All that needs to be changed will be changed, so that he is made meet for the inheritance of the saints in light. So far will the Christian be changed. We melt away one after another; we disappear; but blessed thought, that when we do disappear it is to shine forever in heaven! Moreover, if the change should shock some timid one, there is one sweet thought that may allay our fears, namely, that it is the last change—there will be no more of it. Once changed in the likeness of Christ's glorious body, there will be no more change, but a blessed immortality!

THE NEMESIS OF NATURE.

ACTIONS and their appropriate consequences are bound together by links that can not be severed. And most emphatically is this the case in natural things; for, putting a future state aside for the present, it is a universal law of nature that license and self-indulgence bring with them their own consequences in this world. Repentance and contrition are powerless to avert the consequences of ill-doing in this world. The evil deed will bring with it its own results, unless the evil-doer sets in force some counterbalancing good deed which will neutralize the effects of the evil deed. Only by action can the evil-doer undo his work. The consequences of wrong-doing may be remote, too remote perhaps to be readily apparent in some cases, but nevertheless they will be found if sought for; they may not manifest themselves in the life-time of the evil-doer, and may only reveal themselves in the life-history of his progeny. Such proverbs as "ill-gotten money goes an ill gate," illustrate how far the common observation of humanity has noted the fact that money gained dishonestly carries with it a moral taint. The dishonesty which acquired the money is, however, but a part or outcome of the generally vicious family character, which manifests itself in other forms at other times. The family which in one of its members shows greed which can not be confined within the limits of honest money-getting will display in other members of it bad qualities of another character. The father is avaricious and parsimonious, the son is dissolute and a spendthrift; yet their characters may be fundamentally alike, circumstances having but given direction to the active manifestations of the family traits in each case.

A man looked at physiologically is but one in a link of beings; if that link from any cause ceases to be in harmony with its surroundings, or, in other words, ceases to live according to the laws of God, it can not long exist. The physiologist realizes, indeed, that "the wages of sin is death." Moral death is followed by physical death—sin is suicide. The being who gives himself or herself up to unlimited self-indulgence becomes prematurely old, and transmits to his or her progeny a deteriorated physique and a vitiated mind. The creed of the physiologist is the most practical, the most serious, indeed, in certain senses, the grimmest that as yet has been evolved in the history of humanity. Physiology tells in unmistakable tones that it is indeed a serious thing to be alive—that existence carries with it a grave and weighty responsibility.

Every one is potentially a parent, with offspring which will be the better or the worse for the conduct of the individual. If man is the product of evolution, and his character is formed by his ancestors, then surely, some will say, all responsibility of action is removed from the individual. He is no longer a free agent; what he shall do or not do has been determined for him; he has as little to do with his own conduct as the actions of the Calvinist have to do with his ultimate destiny. But physiology teaches otherwise; instead of luring a man into a conviction of irresponsibility, it points out the grave responsibility involved in every action, and the impossibility of escape from the consequences of deeds done. The character of his progeny will be influenced by his own conduct. The injury done is not confined to himself, unless he die childless. His unborn progeny are to be prejudiced by evil action, or benefited by his good deeds. What he makes himself he is unconsciously determining for his children. As the conduct of his ancestors has its effects upon him, so, in his turn, his conduct will mold to a greater or less extent his descendants. If the responsibility of what he himself does be shifted from his own shoulders to those of his ancestors, with this movement follows inevitably his responsibility for the deeds of his children. He has only shifted the load; instead of escaping from responsibility he has but increased his burden.

Physiology in solemn accents repeats over and over again the terrible statement, "I will visit the sins of the fathers upon the children unto the third and fourth generation of those that hate me;" and how can we hate God more than in attempting to live in contravention to his laws? The transmission of qualities from father to son, the hereditariness of mental characteristics as well as of physical peculiarities, is the moral lesson which physiology teaches with irresistible logic. A man by strenuous effort may improve his character, and in so doing elevate the character of his progeny; he may give way to evil habits, he may degrade himself, and lower the inherited qualities of his children. Just as he can affect their physique, so can he influence their character. He can transmit disease; he can hand down sin. What he has acquired, they possess; for weal or woe he is their parent; and they step into their inheritance whether they like it or not.

Deterioration of the character of the individual is a process which has usually made considerable progress before it is apparent. Like insidious disease, it has got a strong hold before it is detected or is manifest to the ordinary gaze. The skilled cracksman and the fraudulent banker work up gradually to what they become; just as Bright's disease has usually made considerable progress before it falls within the sphere of the physician's vision. The more the study of the mind advances, the more we find that there are psychical laws, like physical laws, that can not be broken with impunity. We know that forgetfulness of the law of gravity means a fall; and if a man falls from the roof of a house broken bones will be the result. We are beginning to see clearly that a breach of a moral law is followed by consequences that are necessarily disastrous. A man resides in a neighborhood where all sanitary laws are set at defiance, and a physical deterioration follows which manifests itself in a diminished power of resistance when an epidemic appears; a man lives amongst people of lax principles, and his psychical deterioration reveals itself in a lowered power of resistance to temptation when it offers itself in some tangible concrete form. The man who lives amidst foul physical surroundings presents little resistance to the stroke of cholera; the man who lives amidst gamblers and courtesans is very apt to sign another man's name instead of his own under the pressure of impecuniosity. A man requires a certain amount of education in iniquity before he will sign his father's name instead of his own, knowing that he can raise money on a bill so signed with ease when his own signature would not procure for him the smallest coin. A steady psychical deterioration has gone on some time before it becomes thus plainly manifest.

Sin, like gout, may exist a long time before a distinct manifestation thereof is palpably obvious. To the physiologist the one is just as much a natural consequence as the other. He knows that just as a man who lives in a filthy neighborhood is liable to be attacked with typhoid fever, or that he who lives in a swamp will probably erelong be the victim of ague; so he knows equally well that a life of self-indulgence leaves the individual in his old age a moral wreck, bereft of all capacity for noble action. A life of pleasure ends in moral decay as well as in tissue degeneration. Each is the result of actions, the inevitable outcome of a line of practice or of conduct. That some individuals are less affected than others is due to the original constitution. Gout produces less evil effects in persons of sound constitution than in those whose constitutions are defective. One man is less deteriorated by a life of pleasure than another, but this depends upon his mental constitution. Mind and body, however, are inherited, as much the one as the other. The comparative escape is to be attributed to qualities which are inherited.

We may now review certain instances of what indulgence will do for the individual and for his progeny. Let us take first a comparatively innocent looking pleasure—the pleasure of the table, the gratification of the palate. Too great indulgence in sapid substances depraves the palate, till all the cook's skill is taxed to give food a flavor which renders it attractive. Self-imposed

hunger and sustained exercise can alone restore the primitive taste for food and endow the gustatory nerves with their pristine sensitiveness. Self-indulgence is followed by self-denial as the only method of regaining the original condition. If there exists a strong, active digestion and a fair appetite, together with a naturally good physique, the practice of taking food in excess may continue for years; but gout is the Nemesis of the gourmand. Even in cases where the individual himself apparently escapes, and dies of some of the internal diseases which we are beginning to recognize as the outcomes of gout, his children may suffer for his offenses. He sows the wind, and they reap the whirlwind. He offends, and his children have to take the consequences. "The children of gouty parents," writes a wise old physcian, "ought especially to follow hygienic and dietetic laws if they wish to escape much suffering. As a rule they ought to be all but water-drinkers throughout life. They have to pay the penalty of their progenitors' excesses or dietetic errors." The transference of the sins of the father to the children is sternly true.

At other times the individual is protected by what may seem at first sight a misfortune and a malady. The dyspepsia of which many complain is truly their good angel. A clergyman of a very gouty family once said, "I have been a dyspeptic for fifty years. Thank God for it." The cause of his pious gratitude was the fact that all his brothers had died before him; gout in some of its Protean forms had carried them off, the dyspeptic alone survived. The apparently innocent pleasures of the table are, then, far from being free from very serious consequences.

Who is there, again, that is not too sadly familiar with the ruin, the decay, moral and physical, which results from the abuse of alcohol? The phrase "a drunken blackguard" is indicative of the general appreciation of the moral deterioration wrought by alcoholic excess. When alcohol is taken for its pleasure-producing properties, "to deepen the consciousness," as a well-known physician phrases it, its evil consequences are too often palpable enough; but it is when it is taken to give relief to misery, when persons fly to drink because they are unhappy, that the results are so distinctly disastrous. I wrote some years ago the following passage: "When alcohol is taken as a moral anæsthetic there is little hope of amendment; indeed, a stationary condition is almost out of the question, and the progress is steadily downwards. The self-consciousness of abasement is added to the former weight of misery and despair, and the situation becomes still more intolerable; the determination to make an effort no longer really exists, and the persons so circumstanced are incapable any longer of making a serious effort, or of adhering to any hastily erected resolution. Their determinations of amendment are as fleeting as they are readily formed, and can scarcely be regarded as serious. They no longer possess the power of adhering to any resolve." The progress of time confirms what was written then. The offspring of the chronic drunkard are deteriorated, and inherit very commonly a defective and impaired nervous system: idiocy, insanity, or epilepsy are their inheritance.

Or, again, the individual abandons himself to sensual indulgence, and lives a life of hedonism (animal pleasure). Misery, blasted lives, the loss of domestic peace, wretchedness, and sorrow follow on the trail of the dissolute—the roué and the demirep alike. Lust brings its own punishment with it often, in many well-known physical as well as moral results. Nor does the marriage ceremony suspend the action of physiological laws.

The history of the descendants of David and Bathsheba, the daughter of Ammiel, is as instructive as it is terrible. Murder and adultery are branded on every one of this unhappy family down to the massacre of Athaliah. All who belonged to it manifested in their own conduct the terrible sins of these two ancestors; for two hundred years the curse of inheritance was upon them. It is not disease alone which may be handed down; moral disease, otherwise sin, can be inherited too.

To pass from matters connected with the senses and the passions, let us consider the effect of a lie. When discovered it brings

with itself swiftly its own punishment. Unspeakable contempt is the reward to the liar when detected. Of all the cowardly, unmanly acts in the whole range of sin, a lie is the most contemptible. To escape the consequences of evil done by a misstatement of fact, to deceive by untruth, shows either a degraded intellect or craven fear. It is impossible to describe in words the withering scorn with which one regards the lie told simply for the sake of gain. When a man has given way to alcoholic excess he becomes an habitual shameless liar; his lies are the evidences of his degradation. There are those who also lie incessantly as a part of their nature apparently; but such persons are now regarded as moral imbeciles, and not as perfect men or women. To a healthy mind a deliberate lie is impossible; it is absolutely incompatible with an honest self-respect. No matter whether the lie be discovered or not, the utterer is conscious that he is a liar when he looks at himself in the mirror. That lie remains, hidden away, perhaps, amongst the residua of the brain cells; but though hidden it is not annihilated, but remains tainting all around it.

The very foundations of our social system are based on the mutual confidence of man in man; and how can this exist where falsehood prevails? Individuals may become rich by falsehood, but lying communities do not flourish. The effects of a lie may not be traceable very far; but no one knows how far they extend, nor how many more lies one lie may necessitate. Nor is it easy to undo the consequences of a lie. "No amount of repentance for lying," says a late writer, "can deprive lies of their tendency to weaken the mutual confidence of men, and thus to dissolve society. The lie once told must work its effects as surely as the stone dropped in water must give forth its arrested motion in rippling circles." The lie is the resource of the coward or the wile of the scoundrel. The man who lies and has ceased either to feel shame or sorrow for falsehood is the most degraded being imaginable, far beneath the maniac and the idiot. There are families who lie. I know one where all seem born liars; chiefly a harmless, boasting lying, but sometimes progressing to malicious falsehood.

When once a lie is told the individual descends to a lower platform; there is a distinct fall in self-respect, and the tendency is downwards. We can only speculate as to the extent the example of a lying parent is deleterious and injurious to his or her children. It may act in two ways. It may induce them to lie; or, fortunately, it may so disgust them that they conceive an abhorrence for lying. But if they learn to hate lying and liars, with what feelings must they regard that parent whose untruthfulness has led them to that attitude! Can they honor that parent? It is the transmission of qualities by inheritance which, to the observant physiologist, is the most appalling side of wrong doing. It is the grim fact that a man's offspring must take and endure the consequences of his misdeeds which evokes our grave thought, and excites a sense of horror at that want of agreement or harmony with our sourrounding which is termed sin.

The transmission of acquired qualities is one of the gravest facts demonstrated by physiological study. Self-denial practiced persistently may enable the children of a gouty man to avert the stroke of their hereditary malady, and even to lessen the taint in their children; but all physicians know that in families with a gouty history a very slight indulgence will develop their latent hereditary foe. The offspring of the drunkard, by constant temperance, and still more by total abstinence, may lessen the taint acquired from a drunken parent; but immense self-restraint is necessary to attain this; and the neurotic temperament of the offspring of drunkards renders it a very hard task. In each case the equilibrium is regained only by reversing the process; the self-indulgence of the parent can only be compensated by extra self-denial on the part of the offspring. There is no destroying the potentiality of force; it can only be met, neutralized, and counterbalanced by setting some new force in action. As a vitiated physique can only be strengthened and improved by sedulous attention and unintermitting care, so a dete-

riorated *morale* can only be improved by the most watchful attitude and unceasing self-attention of the individual.

There are some other lessons taught by physiology beyond those gross and palpable ones just described. There are many comparatively innocent matters of which physiology takes cognizance, and where it discovers consequences the reverse of agreeable. A somewhat keener attention than is ordinarily given will detect some drawbacks of a not unimportant character in several subjects not usually reasoned upon very closely. Physiology tells us that too much study leads to body deterioration; the body suffers from too much mental exercise. On the other hand, the athlete, the keen sportsman, and the generally muscular man has usually but dull wits as to other matters than those he has made specially his own. There is nothing wrong *per se* in either study or athletics; but either carried to excess entails consequences distinctly undesirable. Reasonable indulgence in each is beneficial.

Thus we see that physiology tells us in distinct language that not only are many of the ordinary objects of man's ambition not an unalloyed good, but that in some respects the drawbacks are in excess of the advantages to be derived from success. It tells us that a mere life of hedonism—so craved after by many—is not a thing to be desired. Moderation in the indulgence of every appetite, and every sense, is alone compatible with health of mind and body. It even goes the length of asserting the absolute necessity for a life of self-denial, sometimes even of asceticism, on the part of many individuals for their own sakes as well as that of their progeny. In mind as well as body we are all of us the outcomes of the co-operation of countless ancestral forces, extending back for thousands of years. As the character of each ancestor influences us, so in our turn will our character influence our descendants for good or evil. Those most powerfully influenced will be those who stand nearest to us in time—the parent upon his children, the child upon his child. The influence consequently is strongest upon those to whom each is most personally attached.

It is a very serious thing for any man to assume the responsibility of marriage. He may no longer do that which seemed to him good, the consequences of his actions will not die with him; he will leave children to inherit them. Whatever he has made himself, they will tend to be. Whatever his self-culture, so will they be modified. If a deteriorated physique and a depraved mind are to be their inheritance, then surely, of all his sins, the calling into being of other similar organisms is one of the gravest. Every act of self-development by volition will be felt in his children and his children's children. If he attempt to live in defiance of the laws of God around him, and they follow in his footsteps, then his race shall die out. Looking at the human organism as but one link in a chain of beings, the physiologist sees in the chain the "man." Then he clearly comprehends that "the wages of sin is death;" that the race which sins shall die. In this the physiologist is in perfect accord with the moralist and the theologian. "The wicked man shall perish" is as true physiologically as theologically. No repentance, no contrition can do away with the persistence of force. The consequences of sin will and must follow it; and repentance can only avert the consequences by calling up an equal force to counteract that of the past. Sin must be followed by sorrow,—not a mere wailing sorrow, but a regret that must assume an active form; contrition must not stop at inactive regret, but must take the form of beneficent action. Such, then, are the plain teachings of physiology; and it is impossible for any one to assert that his creed is a demoralizing creed, that it tends to degrade the owner of it, or to deliver him ever to his lusts and his passions; that it relieves him from a sense of responsibility, and renders him simply a recruit for the legions of the cursed. On the contrary, the lessons taught by physiology corroborate those taught us from other directions. The observations of the physiologist bear out the sternest dictates of the ethical philosopher, the denunciations of the prophet, and the teachings of the theologian.

MAROUSSIA: A RUSSIAN LEGEND.

FROM THE FRENCH OF P. J. STAHL.

CHAPTER VI. AN ENCOUNTER.

OXEN are never in a hurry, and they walked much too slowly to satisfy Maroussia. Their steps were slightly quickened by the voice of their little friend, but they would not hasten equal to her impatience. They seemed to enjoy their walk under the pale stars, which yet lingered on the verge of day-break. They sniffed the air laden with the aroma of flowers. The profoundest quiet reigned around them, only occasionally broken by the far-off sound of a gun or the voice of a soldier calling to a sentinel, which were things to be expected. But every little unaffected noise made Maroussia tremble. Sometimes a quick, strong gust of wind made her blood rush to her heart, but it was not for herself she trembled so easily. In every thing that concerned herself alone, this little child-woman was very strong. All her anxiety was for another. Suddenly she called out:

"Hide yourself well, they are coming."

This time it was no false alarm, for very soon a detachment of Russian cavalry surrounded the wagon.

"Where are you going? Where did you come from? Who are you?" cried several voices at once.

"I am the daughter of Danielo Tchabana," said the child.

"Stop your oxen there," said an officer.

Maroussia stopped the wagon.

"Where did you come from?" the man asked.

"I came from home."

"Where is your home?"

"Not far away on that side."

"And where are you going?"

"I am going to Master Knich's house."

"And who is this Knich?"

"He is a friend of my father; he has just bought this hay, and I am to deliver it at his house."

"What did I tell you, good friend?" said an officer. "I knew this was nothing more than a peasant's wagon; but you see traitors and escaped prisoners every-where and in every thing."

"And do you think there are none anywhere? The little gallop you have just made is not such a great matter."

"But this is n't the first run you have given us to-day, and each time in the pursuit of phantoms. Now, pray, what are we to do with our captive? Little girl, would you like to be one of our regiment? But no, you are too little, my child; you would have done well not to have turned out of your cradle so early in the morning."

"This beautiful hay," replied the first officer, "is not to be despised." And then addressing himself to Maroussia, "Is Knich's house far from here?"

"A good distance yet."

"What do you mean by that? May we arrive there with the slow steps of your oxen before one hour or two hours?"

"Two, perhaps; may be three."

"Well then, my advice is that we escort this wagon to the man's house, and if he holds on to his hay he will have to buy it again. My little girl, is this house of your father's friend very commodious? Is he a rich proprietor?"

"He has a big garden and a great many apples."

"Little simpleton, it will be well for his apples that he act promptly. Come, let us assure ourselves of what value this Knich really is. Our visit will no doubt be an agreeable surprise."

The officer spurred his horse, and dashed forward in advance; his comrades followed him, grumbling.

"You are a veritable fool! Here 's a whole day lost running about without rhyme or reason. What poor occupation you give us!"

"Advance, my little girl; you go before." And the wagon moved forward, surrounded by the soldiers.

Maroussia saw all around on every side of her only sinister wicked faces. She thought with an agony of anxiety what would be wise for her to do to relieve herself from this great danger. She looked timidly at the faces bristling with fierce mustaches, browned by the sun, hard, dark, and implacable. Every body had the look, as they followed the wagon step by step, of seeking some kind of rest after severe fatigue and sanguinary exploits. "How many of our own people have these soldiers probably killed already?" thought the child. "Is it not terrible to think about? and do they remember only the evil that they have done? Perhaps all their hearts are not made of stone, and if they discover my secret! O no, they would have no pity."

Maroussia's oxen, still preserving their grave majesty, and yet perhaps a little animated by the martial tread of the cavaliers, walked a little more briskly than before.

The horses of the regiment moved along after them in military fashion, but occasionally those nearest the wagon stretched out their necks for a mouthful of hay from the bundles within reach. This made Maroussia tremble. What if one of these bundles should be loosened? What if—

Suddenly Maroussia, in casting a hasty and curious glance at the soldiers, saw a pair of earnest eyes fixed steadily upon her. Those eyes were as piercing as the blade of a poniard and flamed like burning coals. Were they only attentive, or distrustful also? She grew cold and hot, and felt as if all was lost; but she said to herself, "I must be *like him*," and she took courage. Two of the officers were prancing just in front of her; the one laughed while the other scolded. All the soldiers had become silent, almost stupefied by the slowness of their march. But why were the eyes of that soldier fixed upon her face?

"I am going to look at him also," said the child; and repressing her emotion, she turned her childish gaze full upon him. The eyes in question belonged to a subordinate officer—not young, of a robust, rather ungainly figure, but having a very intelligent face. At once he touched his horse and bounded forward to the side of Maroussia as if to watch her more narrowly. He did not speak to her at first, but his piercing eyes seemed to say, "It is exceedingly strange that so young a child should be leading these great oxen. Who could have chosen for a wagoner such a mere plaything? Who could have allowed her to set out thus in the early dawn all alone, when war is on every side, when the roads are nowhere safe? For some soldiers this would be a mere morsel, no more than a single strawberry."

"Are your father and mother still living, my little girl?" asked he at last. And then, thinking that Maroussia might not comprehend Russian, he translated his question into Ukrainian, "Have you still a father, and have you a mother, my child?"

"Yes, thank God," replied Maroussia.

He remained thoughtful a moment, and then his whole face was animated as if he had suddenly comprehended an enigma.

The heart of Maroussia beat terribly. She was very near fainting, but she "must be *like him*." So she forced herself to appear calm, and asked in her turn, with a voice that trembled a little, it is true, and with a smile upon her lips:

"And you, have you yet a father and a mother? Have you many relatives? You have children, perhaps. Are they girls or boys?"

Was it that little trembling, timid, childish voice, or only the simple question that she asked which awakened remembrances of past joys and sorrows that came in such a tide as almost to overwhelm the heart of the soldier? Whatever he might be, the rude and implacable face which had so frightened Maroussia at first was suddenly transformed, and one might have seen there a reflection of every tender sentiment contained in the heart of a mortal. Generally speaking, he was a strong man, but this little recollection of the past had quite overcome him. His eyes, a moment before distrustful and searching, softened so instantaneously that he

now looked at Maroussia with strange emotion. Did he find in the features of this little girl something that resembled another little one that was perhaps far away, and the thought of whom was sufficient to soften him?

"Yes, I have a little girl," he at length replied.

"Is she big, your little girl?" asked Maroussia, with childish inconsistency.

He smiled; and one might have seen that with this sad, flitting smile there came also the image of a cherished, delicate little creature.

"She is almost as big as you are; yes, she is nearly as tall," replied he.

Then he bent his head, and Maroussia dared not question him further. She left him with his little girl.

They still walked slowly along. The fresh perfumed Summer air was pleasant. A band of rosy light appeared upon the horizon, and an early bird warbled a bright good morning to the sun; at the same time behind the wagon a musical young voice broke forth into a sonorous love ditty. The voice and song of the young soldier were equally harmonious and sweet.

Maroussia was much struck with it; but what was her astonishment when the soldier who had just been talking with her began to sing also. His voice was grave, a deep strong bass, but it touched something in the depths of her heart. There was the most attentive silence during the first couplet, but at the second all the soldiers began singing with him, and the impression was very thrilling. That which astonished and delighted Maroussia in spite of the anguish of her soul, to which, indeed, the song itself responded, was that, although the united voices of the soldiers acquired an intensity like that of rolling thunder, the voice of him who had "a little girl" was heard above them all, and she could constantly distinguish this one voice with its true honest ring. When the song was finished Maroussia felt very sad.

A little way in the distance they saw the quiet waters of a small lake with its verdant shores, still partially obscured by the morning vapor resembling a light veil of gauze, gradually vanishing. To the right a narrow foot-path wound into the shadow of the wood, making a short cut to the house of Knich, till finally a light column of smoke indicated the dwelling of her father's friend. In the presence of the light which came to chase away the darkness of early morning Maroussia became troubled. The bright rays of the dawning day, always so welcome, now became to her a dreaded enemy who might betray them; and in her anxiety she had forgotten the singer whose voice had touched her heart, and now she looked for him in vain, which only increased her trouble, for involuntarily she had regarded him as a protector. Another soldier had taken his place by her side.

"What a tiny little creature!" said the soldier to his comrade.

"Yes, not much bigger than a knot in a skein of silk," said the other.

"And yet she's not afraid of any thing. She marches along like a colonel of Hussars."

"I'll wager she's not afraid of powder or ball," continued the first.

"And she's right," added the third; "what danger would there be of a ball hitting a poppy seed? and is she much bigger?"

"I know these Ukrainians," said the first. "Nobody can say that they are a race of hares. Even the little girls are valiant in this country. I've seen, with my own eyes more than once, what they are capable of. The cannon booms, guns flash, rivers of blood flow, the earth trembles, there are groans, cries, yells, slaughter, and death, and they come upon the battle-field almost immediately, and there they walk about picking up their wounded as if they were gathering corn flowers."

"Yes, and they die by the thousand," said another.

"Bah, we all die in one way or another," replied some one whom they could not see because concealed by two giant soldiers, "Yes, in one way or another. Only it is best to die in a good cause—but who knows what that is?"

The sound of firing was heard and this intimation of a fight chased away, in the

twinkling of an eye, every other feeling. Half-uttered reflections, reasonings barely begun, opinions about to be expressed, witty replies at the end of the tongue, all were interrupted as quickly as a thread is cut by the scissors. The whole detachment with eager eyes and attentive ear interrogated the horizon as a single man. The officers stopped their horses, each giving his own opinion; but the firing began again before they were able to agree.

"That's on our side," cried the young officer. "There's no doubt about it, our side has begun the engagement. March onward! It is our own men who have brought on the fight."

"Hallo, Ivan! you must take this wagon to the house of Knich and make the arrangements about the hay. Forward, men!"

Maroussia had scarcely time to recover herself and collect her thoughts before the detachment had disappeared in a cloud of dust. They were flying like mad birds. The old soldier who had talked with her and spoken of his little girl turned, and she saw him give her a look of kindly farewell.

"O, why might not he have remained instead of going with the rest!"

Maroussia was alone with Ivan, who had received the order to go on to Knich and settle this affair.

"Well, my little drop of honey, move on," said Ivan, lighting his pipe.

Maroussia glanced at him, and thought he had a very bustling, disagreeable look.

"Move on, move on," repeated he in a harsher tone.

Maroussia spoke to the oxen.

Just before the sudden departure of their escort they had judged it proper to stand still. With a hurry and transport wise oxen such as they had nothing to do. At the sound of her voice they hastened to obey.

The wagon took up its slow, measured roll and Maroussia, under pretext of fatigue, had perched herself high up on the hay, and now climbing a little higher she found means of quietly pressing the hand of her big friend with her own tiny fingers, and the calm, confident look which he wore as he lay in his seclusion, reassured her and gave them both increased courage. Ivan, be it understood, was a hundred feet away, suspecting nothing as he walked in front of the oxen, smoking his pipe and looking straight before him. One could very readily see that war had passed over this part of the country, for where one single green field, ready for the harvest, might be seen you passed ten or a dozen desolated, absolutely ravaged. Maroussia seeing all this thought to herself, "Oh, how terrible this war is!"

The firing was repeated at intervals, becoming more and more distinct. The wagon was just then dragging heavily up one of the small hillocks, not rare in this part of the country and under which the dead of ancient wars are said to be buried. When they reached the top of this little eminence, Maroussia saw in the plain at some distance quite a number of tents partially obscured by clouds of smoke and occasionally illuminated by tongues of flame. That was the very ground upon which the combat was going on, announced by the distant firing. From time to time they could even hear the vociferations, groanings of the wounded, neighing of horses, and cries of children mingling with the early morning breeze. Maroussia had under her very eyes the frightful spectacle of a burning village, of the houses of the rich enveloped in flames, and the cabins of the poor razed to the ground in the general wreck.

The wagon of Maroussia had turned aside from the view of the battle-field, and from quite a distance Knich's dog had discovered it. It was easy to see by his expectant attitude that whatever they might be he intended to receive them with all the coolness and vigilance of a creature who all his life had seen and understood many things, but who has for his maxim, "It is best to be always on the alert and never too quick in showing suspicion." Hardly had the wagon stopped before the door when a boy of six or seven years, strong and solid as a rock, and rosy as the morn, with all the alertness of an eagle presented himself to Maroussia, and the determined look of his clear eyes said as plainly as words, "You have come

to our house; now you must speak out and say what you want with us."

"Is Master Knich at home?" asked Maroussia.

"Then you have come for the grandfather?" said the boy, questioning instead of replying.

"Yes, for the grandfather; is he at home?"

"Yes, he is at home."

"Where, then?"

"He is in the garden, perhaps; or he may be in the house or in the field."

"Will you tell him that we are come?"

"And make haste," added Ivan, relighting his pipe.

But the grandfather had already made his appearance. At first sight one would say Knich was a good old man, a little bent with age. He wore the simple country costume, consisting of a very ample shirt and pantaloons, big enough for two such men. His head was covered with a straw hat having a huge brim, which he had probably plaited himself. He recognized Maroussia immediately, and did not seem the least surprised at her coming; on the contrary, one would have supposed that he was expecting her, and that just such a visit was the most natural and simple thing in the world.

"Ah, my little girl," said he, "how do you do? Always well, always happy. Come, come, let's go into the house. But if you like the open air best, Tarass knows just the places where you can find strawberries and nice ripe raspberries. And we have some other things, too—a whole lot of sweetmeats—little pies and big ones, too, and honey cakes."

Ivan was struck with the word "pie." "I see you have a well ordered house," said he, in rather a severe tone, but which the vision of big pies had softened considerably.

"I thank God that it is so," replied the old farmer. "Come in, come in, I pray you." He had such a simple natural manner, the good old Knich. "Come in," he repeated again. "What a pleasure thus to welcome a stranger. I like all the soldiers. Come in, sir, I pray you."

The soldier that he liked so much was tired as a dog and as hungry as a wolf; so he followed the old man in doors without much begging, and throwing himself upon a bench yawned and stretched his limbs—in a word, profited well by the happy incident which allowed him to indulge himself a little after the fatigues of the march. It was evident he took the old Knich for a good, simple-hearted but ignorant man, and that in truth he was thinking of and caring only for the "big pies."

Maroussia was at first occupied with driving the wagon into the court-yard. The little Tarass very eagerly bounded around about her, pretending to render assistance. When her duty was accomplished she went at once to find the two men. "Père Knich," then said Maroussia, repeating word for word what the envoy had told her, "what splendid grain you have. You might even cut it without waiting for it to be quite ripe."

"God be praised. God be praised, yes, we shall have a good year." His voice was calm and betrayed not the least emotion. He trotted back and forth through the room, calling his servants, giving his orders in a clear, gay voice, not questioning the child even with his eye. He was simply an honest, kind-hearted man, proud of his pies and his barn, and smiling complacently over the favor that he was bestowing upon the stranger in the good breakfast he was about to offer.

"Did he understand?" questioned Maroussia, and her heart beat fearfully; and if he did not understand! The poor child did not know what to think nor what to do. "I must be like him," at length she said to herself. "I must be brave and learn how to be silent and to wait." She could understand that the envoy had given proof of all these qualities by remaining quietly in the wagon even when he saw the escort reduced to a single soldier; for this Ivan could have been put out of the way in an instant. There he still remained in his place of concealment after they had entered the court-yard. Thus she felt that she was being like him when she did not ask a single question of the old man, but trotted behind him into the house without a word.

This cottage was quite large; the furniture

consisted of heavy benches of solid oak. The walls, as white as snow, were festooned with branches of dried herbs, filling the house with the aroma of the beautiful wild flowers of the steppe. In one corner little statues of Christ and his apostles were ornamented with fresh flowers, and in the center of the room stood a large table of massive oak covered with a white cloth with colored fringe. Old Knich invited his guests to be seated saying, "We must not forget the refreshments; they will be very soon ready, very soon." And then he ran from one side of the house to the other, bringing his largest and best glasses, down into the cellar, up into the loft, opening cupboards, displacing pots and their covers, letting spoons fall, emptying one bottle into another, climbing up to the roof for the best dried meats, hastening hither and yonder. All these preparations which promised so much to the half-famished soldier, kept his attention fixed continually upon his host. Every minute he thought he would see some superb new dish arrive, and he felt all the trembling anxiety of the covetous and greedy. With the promise of such a royal repast he forgot the whole world, or rather he saw the world in a confused way across a mountain of pies, cheese, meats, condiments, and various dainties.

"See here, listen! master, do n't give yourself so much trouble," he said from time to time. "I shall be satisfied with a little—I mean to say I shall be satisfied with what I see now. O yes, I shall be perfectly satisfied."

"No, no," replied old Knich; "no, permit me to set before you something more to your taste. Permit me, sir,—may I ask your name?"

"My name is Ivan," replied the soldier with a long breath, quite disarmed by the hospitality of the old peasant.

"Very well, Mons. Ivan, you must permit me to set before you the best my poor cottage can afford. It must be so. It must be so. I am sure you would not afflict an old man by refusing. You will taste a little of these dried chitterlings, and of this ham also, and then of my cheese; you shall see—"

"But we military men are not accustomed to these delicacies. If our hunger may be appeased, we are quite satisfied," said Ivan.

"Certainly, certainly, Mons. Ivan. Oh, a soldier's life is very hard. I've always heard that. Well, all the more reason for trying to serve you well once in a while. Yes, yes, believe me, it gives me great pleasure."

Little Maroussia seated in one corner was trying to be just as she thought "he would have her be," and to all appearances she was calm and tranquil. But what a constant ebb and flow of hope and despair? It could not be described. Her good friend, was he still buried in the hay, or had he on the contrary withdrawn from it, and could he, in that event, find a secure place of concealment? Then if he left the place where would she find him again? What a risk he ran, and what would her father say if she should be separated from him before he was safely at his journey's end?

The little Tarass, after having satisfied his curiosity in regard to the new-comers, went to the window, and counted the reports of the guns, which he could hear distinctly, though far away. After a long waiting the breakfast was finally ready and Mons. Ivan set himself to work to devour it with a sort of angry feeling. At the first mouthful he had the severe and ferocious look of a soldier who did not care to consult his palate, but very soon his face began to soften. Little by little his countenance brightened, and ended by becoming perfectly resplendent. After a few glasses of raspberry bounce his eyes took on quite a caressing expression and a beautiful smile played about his lips.

Old Knich did not fail to present him with new dishes and new beverages every few minutes, saying:

"O, I just now remember that I have something in the cupboard that will please you. Just wait a moment. With your permission I will bring you some, Mons. Ivan, and you shall give me your opinion."

Mons. Ivan resisted nothing. He could only shake his head a little, as if he would say, "All right, all right, every thing's agreeable to me, just now."

"Come, come, Tarass, what are you doing there?" asked old Knich after placing a new flagon before his guest. "Is this a time to be gaping in the air? Come to your senses, sir, and go and see if it is not time to give some hay to the oxen. Would you believe it, Mons. Ivan, I have in this little Tarass quite a good worker? He is yet but a stripling, but he is neither stupid nor lazy."

Mons. Ivan wished to reply, but he could improvise nothing more than a silly smile. As for little Tarass he needed no coaxing; with a bound he was at the door. Maroussia rose softly and said, "I shall go with Tarass."

"Go, my little one," replied the old man; and when she passed near him he put out his hand and caressingly smoothed her hair. It was a very little thing, but as if by magic it established a confidence between the two. She felt reassured and strengthened, her anxiety disappeared, and her poor heart, which until now seemed held in a vise, was again free and light.

"My good fellow," said Ivan, making a desperate effort to collect his thoughts, "that hay is ours, do you understand? We captured it, and it is ours; that's plain, is n't it? However, if you want to keep it you can just give me the full price. Give us money, a good deal of money, and you shall have it. That will be a good bargain. It will be all right, on the word of an honest man."

"O, you are the master, Mons. Ivan," replied old Knich. "You can take it all if you want to. You are the master."

"That 's well, all very well," replied Ivan. "You are a good fellow—"

CHAPTER VIII.

ENTERING the court-yard Maroussia saw her wagon still filled with hay and in the same place. Tarass was working with great zeal. He had climbed upon the wheel, and dragging great armfuls of the hay from the bundles he could reach, he was giving them to the oxen, who accepted the offer with great dignity and calmness. Maroussia turned away from the wagon like a wounded bird.

Tarass began to chatter and ask a thousand questions, but Maroussia was too much absorbed by a cruel anxiety to reply save in monosyllables. Suddenly the idea occurred to her that her keeping so close to the wagon might excite suspicion, and she moved rapidly away. Crossing the wide court-yard she entered the garden, and stopping in the midst of the thickly planted shrubs looked about her and across the fields which spread out to a great distance. "What had happened?" she asked herself. "What had become of him? How was he to be released from his place of concealment? The look of the wagon was not changed; could he still be—" Then she returned quickly into the court-yard to assure herself that no one was observing her. "O, if I could but call him, or by some means attract his attention." Just as she passed near a great heap of stones piled against an old ruined wall, not very distinctly, but as if it came from under the ground itself, the voice which she knew quite well, said:

"Thanks, my little Maroussia; be quiet, all is well."

She could not doubt it. It was the voice of the one for whom she was so anxious.

Overcome with joy, she fell upon the grass as if struck by an arrow, absolutely unable to take another step. By degrees she recovered, and endeavored to find out from whence came the voice which she was so glad to hear. The great mass of stones looked very ancient. They were covered with moss and matted foliage and clinging plants, and a quantity of small, yellow flowers dotted here and there shone like stars in the rays of the sun. Evidently the stones had been there for a very long time, perhaps part of a building which had entirely disappeared, now forming an old cave in which her searching eye had found a small opening, though scarcely visible through the thick foliage which obscured it.

"Did I hear aright?" asked Maroussia.

Her heart beat as if it would burst, but she heard again a voice from behind the shrubbery saying to her, "My faithful little friend, reassure yourself. We have passed the rapids, and we will not be drowned in sight of port. I am full of hope."

Maroussia held herself very still, listening attentively, though all was again profoundly silent. These words must have come from her big friend, and they took away her fears like magic. Now her heart was filled with joy, and her cheeks were covered with a brilliant carmine, making her bright eyes sparkle with increased brilliancy.

So changed was her whole appearance that the little Tarass, who was playing in the court-yard, fighting an invisible enemy, stopped suddenly, and running toward the girl, stood in front of her, gazing with curious eyes, thinking to himself, "She looks ever so much happier. I think grandpa must have given her something good. I wonder if it was spiced cake?" And the more he looked at her the more was his imagination excited with marvelous fancies and chimerical ideas, looking almost like a young eagle with extended beak and piercing eyes, trying to discover his prey. Then Maroussia said to him:

"Would n't you like to go into the garden?"

"Yes," said the little boy, hesitatingly; "but tell me first, please, what did grandpa give you?"

"Has he given any body any thing?"

"Why, yes, he must have given you something very nice."

"No, he has not."

"Then he has promised you something."

"No, he has promised me nothing."

Tarass looked at her distrustfully, saying, "Why, then, do you look so happy?"

"Who, I?" She wished to say, I am not happy, but she could not tell an untruth even for the good cause, and could think of nothing to say, except, "Come, let us go into the garden. Shall we not find strawberries?"

"Yes; I always find them when I look for them," replied Tarass, with a little arrogance.

"I shall try to find some, too; do n't you think I might?"

"May be so; that is n't very difficult. Very good kind of work for little girls. Now if you were going to catch a mole or trap a hedge-hog, it would take another pair of hands." And all along their walk to the garden Tarass had a very proud, dignified manner, as if he considered himself a famous trapper. "Little girls have n't any courage," he said; "but boys—"

"O, little boys are very brave," said Maroussia, seeing that her companion was looking for a word worthy to express the superior merit of boys.

"That 's so," replied Tarass, touched with a feeling of respect for the little girl who could say so much for the boy, and thinking her not so bad after all. "They know how to ride horses, they do," he continued; "and they are able to tame the fiercest horses, too."

"That is very admirable," replied Maroussia, smiling.

"Some day you shall see if I do n't know how to ride our mare. Once when I rode close to the hut of old Hannah I gave her a famous fright. The old woman thought it was a Tartar's arrow. You know that all these old women are terribly afraid of the Tartars—"

"Poor old woman," said Maroussia.

"But you must n't be afraid," said the boy with a sudden impulse of chivalry and generosity.

"Thank you," said Maroussia.

"O, you are very quiet because you think I am joking about the danger; but it will come some day, very soon, perhaps, and then I 'm going to tear in pieces all the enemies of our dear Ukrainia. Will you go through this little gate? Come this way, the berries are all on this side. Do you know what my project is?"

"No; tell it to me."

"Well, my plan is to fall upon the Tartar and Turkish camp, kill them all at once, and take their chief prisoner. What do you say to that?"

"That would be glorious," replied Maroussia, seriously.

"Glorious! yes, indeed. There was once a country girl in France who drove away all their enemies—"

"O," said Maroussia, whose eyes were kindled with enthusiasm, "how happy she must have been!"

"But she was burned afterward," replied Tarass.

"All right, all right," said Maroussia; "still she was the happiest woman in the world."

"My father will tell her story to you if you want him. A French woman told him about it in the city. We don't hear any thing about such histories here. This young woman called herself 'Joan of Arc.'"

"Joan of Arc!" replied Maroussia, her eyes brimful of tears. "Joan of Arc—happy, happy girl."

Tarass was quite elated. What a young girl in France had done, surely a Ukrainian *boy* could not fail to accomplish. Then he confided to Maroussia the thousand projects which burned in his little brain—glorious projects which all ended just as he desired, of course.

As they walked about the garden gathering strawberries, he disclosed to her his ideas in regard to the last combat, and regretted very much that the grand Ataman was so slow in his attacks.

Maroussia listened in silence, dreaming of that girl whose name she had heard for the first time, who was so happy as to give freedom to her country.

Meantime Tarass was thinking better and better of little Maroussia. "How well she listens to what I say. I'm glad she is n't like that foolish, noisy Odarka, who always wants to have every thing first, and thinks she knows every thing. Yes, Odarka is very disagreeable, but Maroussia is a good girl, and I'm going to gather as many berries for her as she wants." But while he picked the berries Tarass could not keep his eyes off Maroussia, thinking "how her face shines! how happy she looks! She could not be more so if all the dainties were set before her. I'm certain she must have a little plate of spiced cakes hid away somewhere. But she 's such a good girl, I know she 'll divide them with me. Nobody can look that happy without some reason. Yes, she must have something very nice, or she knows she 's going to get it soon. Perhaps she 'll tell me her secret presently, and give me half, may be more."

CHAPTER IX.

It was almost midday when the surfeited, gourmand soldier awoke from his drunken sleep. Gradually his memory returned, and his wicked eyes began a questioning gaze of the white walls, the remains of his morning repast and the close, darkened room in which he found himself all alone. As soon as he could recover from his stupefaction he began to bluster, stumble, and vociferate in terrible oaths for the old farmer who he imagined was playing an unfair game with him. His voice of thunder and his ugly face, blazing in the glare of the noonday sun, as he emerged from the house door into the garden, so startled the children in their *tête-à-tête* that they ran as if for their lives, calling upon the grandfather to attend the frightful soldier. Knich very promptly came forward and with the utmost affability assured Ivan that he was ready to obey his every order. The soldier demanded pay for the hay, which Knich did not dispute, but drawing from his capacious pocket a leather wallet, counted out the money which Mons. Ivan quickly transferred to his own; then, with rapid strides, he reached the spot where his horse was quietly munching his hay, mounted and galloped away, without deigning to respond to the repeated kindly wishes of Knich for a "bon voyage."

A few moments afterwards the grandfather had quietly disposed of the little Tarass to look after the fish-nets. Then turning towards the little girl, he fixed upon her a gaze so strange and penetrating that her young heart beat wildly, and she hardly knew what to expect. At the same time the personal features of Knich were suddenly transformed. Instead of the figure of a simple old farmer offering his liquors, *pâtés*, and delicate viands with almost servile humility to the coarse, brutal soldier, one saw under his overhanging brow eyes burning and sparkling like coals of living fire. The wrinkles in his forehead had disappeared as if by enchantment, and his features were rigid, severe, and full of character. His figure was drawn up to its fullest height, and the whole man looked grand as if filled with a noble purpose. For a few

moments Maroussia looked at Knich like a frightened, fascinated bird. He spoke, and his voice no more resembled the voice that spoke to the soldier than a violin in the hands of a master resembles the violin of the blind mendicant seeking his bread from door to door.

"Maroussia, thy friend wishes to speak to thee. He is not far distant. Wilt thou hear what he has to say?"

The eyes of the beautiful little girl replied for her, as she was unable to speak; joy had taken away her voice. But Knich understood it all, and made her a sign to follow him.

Instead of going toward the old cave whence she had heard his voice, Knich led her into a hall of the old house; and passing the door of their breakfast room he opened the door of a large apartment filled with provisions without limit for future use—an abundance of pears, apples, and dried cherries, pyramids of eggs, bottles and barrels of wine.

Maroussia hesitated a moment upon the threshold of the place, but Knich encouraged her to follow him, rolled aside a barrel of brandy and disclosed a little wooden stairway leading into a subterranean apartment. "Step carefully, my little one," said he, "the way may be slippery for your little feet."

The little girl felt a firm hand sustaining her in all the difficult places in their descent into the subterranean apartment. Suddenly a wide ray of light penetrated the gloom and lighted up the cavern, and her quick eye caught sight of the envoy restlessly pacing to and fro. He stopped at once, and bending gracefully toward the child said:

"Maroussia, my gentle guide, I am very happy to see you again, and to be able to say, I thank you."

Maroussia impulsively threw herself into the arms of her big friend, crying out, "Oh how you must have suffered down under the hay, and when the soldiers came, and that terrible Ivan kept looking incessantly at the wagon."

"O, I recollected the history of the bandit's wife. But I did tremble for my little guide."

Old Knich could scarcely restrain his tears. It was evident that the frail little girl had become to the rude warrior something sacred and dear. They walked some distance, passing alternately from light to obscurity, when Knich said to the envoy, whom he addressed as Tchetchevik:

"We have no time to lose," at the same time showing him a niche, the sight of which reminded them of the rich store of clothes, arms, and vestments discovered by the bandit's wife. "Choose from these your disguise."

Tchetchevik stooped, and from a huge pile of strange costumes drew forth a large white beard, and a peculiar cloak with a hood, something between the habit of a monk and the dress of a strolling minstrel. He also discovered an old lute in tolerable preservation. In fact, he lacked nothing for a perfect disguise; the wig, mustache, and even the eyebrows were in perfect conformity with the beard.

"See," said he gayly, "these will suit me exactly. Now let's look for something to please Maroussia."

"Will Maroussia accompany you?" said Knich.

Instantly the child's face assumed an expression of surprise and indignation. "What would my father and mother say? and he" (pointing to Tchetchevik), "what would he think, if I did only half my duty?"

"But, my little girl, do you know where you are going?" replied Knich. "Do you know that it is hardly probable that he will return safe and well?"

"Then would it not be still more wicked for me to leave him?"

"Ah, my brave little girl! may the little Tarass grow like thee."

The envoy was not so easily satisfied in selecting a costume for the beautiful child.

"These are all frightful," said he, "and would make her look like a beggar."

"It may be best that I should look like a beggar," said the child. "Perhaps we may yet be hungry, and I shall choose this ragged dress for my disguise." Then the child

stepped aside and quickly divested herself of her own picturesque costume, appearing in the rags and tatters of a street beggar.

"Ah, little one," said Knich, "you still have the air of a princess. We would have to change those eyes to make you resemble a beggar."

Meantime the transformation of the envoy was complete.

"What a beautiful old man," said Knich. "Maroussia, let me introduce you to your grandfather."

"No, no," the child said, "he is still the friend of Ukrainia. Come, let us go."

The two men conversed apart for a few moments, exchanging opinions upon the state of the affairs. It seemed that the country was in the hands of two Atamans who were jealous and distrustful of each other. These jealousies and discords must cease, and unity must prevail for the best good of the people. "Whom has our Ataman near him to counsel and advise with?"

"No one save Anton, who is selfish and hopeless; but his wife is a true soul, and his sister is almost an angel."

"Then," said Tchetchevik, "he must feel discouraged. I must get to him as quickly as possible, and if God will aid me I shall gather together our scattered army."

Here Maroussia approached Knich, and fixing her beautiful tender eyes upon him she said, "I have a great favor to ask of thee."

"Speak, little one," replied the old man.

She took his hand, saying, "Tell my revered father, tell my beloved mother—" but tears choked her utterance, and it was some moments before she could subdue her emotion; but making a great effort she continued in a firm voice, "tell them that if Maroussia should never return, it is because she has died in doing her duty, and she will die thinking of them, of the little brothers, too, and of Ukrainia. I kiss the hand of my father and mother in kissing yours, Knich, and I bid thee adieu and thank thee."

"Ah, dear little one," said the old peasant, "may God lead thee; but thou wilt never be in thy right place until thou hast reached paradise."

Tchetchevik looked at her with true paternal affection. "And, do you know," he said to Knich, "that this little drop of dew will continually refresh me?"

Knich nodded his head, replying, "Truly, thou art right." He then put the lute into the hands of the envoy, adding, "It is time to start. I must put you upon the right road and be in my own home again before night."

They issued from the cave by another opening, and as they emerged into the highway the strong, brave soldier could not possibly have been detected in the person of the old musician bent with age and misfortune; and Maroussia, of the radiant eyes and brave heart, was only a poor little mendicant. Some distance from the house they halted; and seated upon the green turf the fingers of the old musician touched lightly the strings of his lute, and he sang in low chanting measure the words of an evening prayer. Whilst old Knich listened with thoughtful interest the little girl lay down at his feet and fell asleep. Presently they were on their feet again, their hands clasped in friendly parting, and the exchange of the few words, "Our all for our country."

THE PROBLEM OF THE UNIVERSE.

THE great controversy with unbelief constitutes one of the chief characteristics of our times. The aim of modern infidels is to account for creation without a Creator. The motto of scientific materialists may be summed up thus: "We have no need of the hypothesis of God." Their creed may be expressed in the prayer which a soldier is said to have offered before the battle of Blenheim, "O God, if there be a God, save my soul, if I have a soul." Materialists teach that matter is eternal and indestructible, and therefore creation is impossible. This is deserting scientific ground, and is, besides, a mere assumption requiring proof. Berkeley's denial that matter really exists is just as probable. The alternative lies between faith in an infinite God, Creator, and Governor, as the Bible teaches, and attributing to the particles of matter the power of intelligence and self-direction. It is simpler and easier to believe in a personal God than in an impersonal divinity called Force. The conception of God as from everlasting is simple and sublime; but an infinite force from everlasting, destitute of intelligence and will, is contradictory and absurd.

It is asserted by some of our scientists that creation is an impossibility; but this is a baseless assertion. The first appearance of life on the earth was a mighty step, and, apart from creation and creator, has not been satisfactorily explained by men of science. Hugo von Mohl's Protoplasm and Professor Huxley's Bathybius may exist as "the physical basis of life," but whence the protoplasm comes is still a mystery. Haeckel says that the living slime in the depths of the ocean may have originated by spontaneous generation. But this is unscientific guessing, while the explorers of H. M. S. *Challenger* failed to find in the deepest dredging any of Huxley's bathybius. Whatever living protoplasm is known to science, in sea or on land, came from previous animal or vegetable life. Sir W. Thompson's humorous suggestion that the germ of life in our earth was derived from the *débris* of some other life-bearing world wandering through space, only removes the difficulty and the mystery a step farther back.

A vegetable with life is a miracle in the mineral kingdom, because it is a creation. Animal life is still more wonderful than vegetable. Hegel admits that "an animal is a miracle in the vegetable world." The truth is, that nature can not be expounded and its mysteries solved without the admission of a divine mind. If this be denied, then we must fall back on naked atheism—that the world is a "fortuitous concourse of atoms," as Democritus thought long ago; and it is rather remarkable that this theory, after being repeatedly refuted and exploded, has been revived again by some of our scientists. If a man should affirm that an ape, casually meeting with pen, ink, and paper, did happen to write exactly the "Descent of Man," or the "Origin of Species," would any one believe such a story? And yet it is just as incredible that this wonderful universe, or the innumerable portions of the human body, did, by fortuitous concourse of atoms, compact themselves into this beautiful, noble, and useful frame, "fearfully and wonderfully made."

Some scientists call the mystery of the universe and of being, Evolution, or Development, and say that it explains all; but evolution, as expounded by them, is as great a mystery as creation. The Bible and true science both teach that creation was gradual; and in this sense I believe in evolution. It is just God's way of working, but it never of itself raised a plant into an animal, it never raised an ape into a man. Evolution or development, apart from the guidance and power of a living God, is an unscientific, unmeaning word. Evolutionists must concede that things are developed on plan and "design;" but this plainly supposes a mind which planned and designed. We can not believe that inorganic matter planned. All creation teems with marks of purpose. The

feathers of birds are a wonderful contrivance, full of design. The human teeth afford an instance not only of design, but of the completion of the contrivance being purposely suspended. They are formed within the gums and there they stop, and by the time they are wanted they are ready. The eye is also full of marks of purpose. But design in nature argues irresistibly an Almighty Designer, Creator, God.

To use an illustration, when we see a house having in it all the marks of design, we know it could not build itself. The timber could not emerge cut and squared out of the forest, nor the stones meet it hewn and polished from the quarry. The house, therefore, must have had a builder. We apply the same argument to the world, and its maker, God. The argument from design is attempted to be demolished something in this way. We have seen one house planned and erected by an architect, and therefore we conclude the same with regard to others; but to make this reasoning of any force, it is requisite we should have seen and had experience of the making of the world. Well, man could not see the world made for a very strong reason, because he himself was made after it, and he could not exist before he was made. Creation is beyond the sphere of observation or experience, but it is not less true on that account. Our belief in it rests on other evidence: "Through faith we understand that the worlds were framed by the word of God." This faith satisfied Bacon and Newton and the great masters of inductive science, though now questioned by smatterers of "philosophy falsely so-called."

There is one weak point, among many others, in the attempt to account for creation without a creator, and it is this—they all fail to give any satisfactory explanation of the origin of life. Mr. Darwin says frankly, "How life at first originated is a hopeless inquiry." The alternative lies between "spontaneous generation" and divine creation. Spontaneous generation of life from matter has never yet in a single instance been verified, and its possibility is denied by the highest scientific authority. But life began to be on this earth—therefore, it must have had a supernatural origin—it must be a divine creation; and if so, there must be a Supreme Being, Creator, God.

Even if it were proved that life developed itself by spontaneous generation from matter, did matter also create itself? To assert this would be blank atheism.

There is a deeply solemn side to this subject; this attempt to solve the problem of the universe without God, to expound the mysteries of nature without the admission of a divine mind. It is at least indirect atheism. Very probably some who advocate these views would repudiate the charge of being atheists, and would even denounce atheism. They merely assert that such questions are beyond the scope of science, meaning thereby physical science. But there are other things besides the laws and conditions of matter with which inductive philosophy has to deal. The phenomena of mind are as real as the phenomena of the material world, and belong to science or true knowledge, although not to physical science or the knowledge of material phenomena. Denying the existence of mind because beyond the scope of physical science is an idle assertion in the view of those who have broader ideas of nature and of philosophy. Again, it is not the master minds of science that make such assertions, but the narrow cultivators of some special department of research.

They may repudiate the charge of atheism, yet they certainly mean to shake our belief in the existence of a deity; they attempt to show that the world might have been as it is without a God. It is surely a serious responsibility to propagate views which have a tendency, directly or indirectly, to lead men to believe that they are without God in the world. History abundantly proves that atheism produces invariably a harvest of crime and misery. That the leaders of the irreligious, "scientific" movement of the present day are immoral, nobody affirms; no candid antagonist would deny that some of them are personally moral and amiable, but the tendency of their teaching is subversive of morality.

Happily their influence is not great. It is a remarkable fact that the masses of men have always escaped atheism; it is only to be met with in a few individuals, or in some school of scientists and philosophers. Men and women with yearning, loving hearts, with tender, passionate affections, who have buried their dead out of their sight, who could not endure to live if they were doomed to sorrow without hope, can not but reject such doctrines as these. They will feel that the comforting and ennobling lessons of revelation are more adapted to toiling, suffering, creatures; and the Great Teacher has turned the "burying-place" into the "sleeping-place," from which there will be a waking again, by the cheering words, "I am the resurrection and the life."

A CONSECRATED LIFE.

A TRUE life is its own best eulogy; and the multiplication of words of praise, be they never so sincere, can add but little to the halo which gilds the memory of those who, beloved of God, have finished their course with joy and gone from us into the upper glory. And to us who, having watched their entrance "through the gates into the city," and must turn back again to earth's dusty highways, there is, in thinking and talking of the "loved ones gone before," not only comfort for our lonely hearts, but also grand inspiration toward living as they lived, and working as they worked for the Master.

Henrietta Caroline Sperry Maclay was born March 21, 1823, in Bristol, Connecticut. She was the youngest child in a family comprising two sons and three daughters. Her father, Henry Sperry, Esq., died while she was very young, so that she had no recollection of his personal appearance. Her mother's maiden name was Stillman. She remained a widow after the death of her husband, and devoted herself to the care of her family, dying in the year 1849 at the residence of her son, Corydon S. Sperry, in Brooklyn, New York.

Miss Sperry's educational advantages were good, comprising attendance in the public-schools, a partial academical course under the tuition of her brother, then a recent graduate of Yale College; and, finally, the thorough course of instruction afforded by Mount Holyoke Seminary during a period of nearly two years. From the time of her earliest recollection her mind was strongly impressed by religious subjects. Her home was thoroughly Christian. The public religious services conducted under the auspices of the Methodist Episcopal and Baptist Churches which she attended were stimulating and impressive; and among her earliest recollections, which lingered with her through life, were those connected with "repentance toward God, and faith toward our Lord Jesus Christ."

I have not been able to ascertain the exact time when she first made a public profession of her faith and united with the Church. She became a member of her brother's family in Brooklyn, New York, about the year 1838, and shortly after that time connected herself with the Presbyterian Church in that city, of which the Rev. Samuel Hanson Cox, D. D., was the pastor, and with which her brother and his wife were already members. Subsequently she felt a strong desire to enjoy the privileges of the Methodist Episcopal Church, with which her earliest religious convictions were associated; and in the year 1849 she transferred her membership to that Church, and remained in its communion to the close of her life. Her first home in the Methodist Episcopal Church was in connection with the congregation worshiping in Sands Street, Brooklyn, with many of the members of which she formed life-long friendships.

After leaving Mount Holyoke Seminary, Miss Sperry taught for brief periods in Lansingburg and Brooklyn, New York, and also in Newark, New Jersey, where, for some-

what over a year, she taught in what was called the "Newark Wesleyan Institute." During these years her mind was much exercised in regard to the question of her duty to those dwelling in the darkness of heathenism. One of her cherished friends, the Rev. J. B. Hill, of San Francisco, California, writes of her feelings at that time: "Oh, how well do I remember sister Henrietta when her heart was so full of devotion to the missionary idea, and her thoughts constantly dwelling upon the subject of missionary life in a foreign land!"

While connected with the Newark Wesleyan Institute, Miss Sperry, chiefly through the influence of the Rev. D. P. Kidder; D. D., was appointed to the mission of the Methodist Episcopal Church which, in the year 1847, had been commenced in Foochow, China. She sailed March 16, 1850, from New York City for China, and was fortunate in having as fellow passengers the Rev. J. V. N. Talmage and wife, of the Reformed Church, Miss C. P. Tenny, of the Protestant Episcopal Church, and Miss Baker, of the Southern Baptist Church, all going as missionaries to China. She arrived in Hongkong July 6th, where she was met by the Rev. R. S. Maclay, of the Methodist Episcopal Mission in Foochow; and July 10, 1850, she was united to Mr. Maclay in holy wedlock by the Rev. George Smith, D. D., Bishop of Victoria, the marriage ceremony being performed in St. John's cathedral, Hongkong.

Shortly after Mrs. Maclay's arrival, a small school-house was built on the mission premises, and toward the close of the same year she commenced in it the first Protestant day-school for Chinese girls ever established in Foochow. The school opened with an attendance of eight scholars, which soon increased to thirty. It was continued with the opportune assistance of other ladies of the mission until 1859, when, on the arrival of the Misses Woolston from America, it was merged into the Boarding-school for Girls, which they organized under the auspices of the Ladies' Missionary Society of Baltimore. When the Foochow Mission was commenced there were scarcely any text-books to aid the student in acquiring a knowledge of the Foochow dialect. Prompted by a desire to do something toward meeting this urgent demand, Mrs. Maclay ventured to prepare a small illustrated primer, designed to direct the student's attention to the difference between the written and the spoken dialects, and, by the use of object lessons and easy sentences illustrating each style, to conduct the beginner to the correct acquisition of some of the most common and necessary words and idiomatic phrases of the dialect. The book was published by the mission, and though it never attained to an extensive circulation, yet as one of the earliest efforts to meet a want which is now supplied by larger works, and as affording an illustration of that trait in Mrs. Maclay's character which enabled her quickly to appreciate and earnestly to take hold of the duty nearest at hand, it is worthy of mention in this connection.

Among the social abominations with which Foochow missionaries were confronted, and at times appalled, a prominent place must be assigned to what has been popularly designated "female infanticide." To remove, or at least mitigate, this evil, the Chinese government had established a foundling asylum in the city of Foochow. And at the time of which we are now writing the Roman Catholic missionaries in Foochow opened an asylum for the reception of castaways. Protestant missionaries also felt that in the presence of such a crime it was necessary not only to utter public protests, but also to take such practical measures as would aid the Chinese government in its efforts to remove it. The Methodist Episcopal Mission, accordingly, toward the close of the year 1858 instituted a plan by which a foundling asylum, supported entirely by local contributions, was established.

To this enterprise Mrs. Maclay devoted herself with characteristic energy and perseverance, giving largely of her time and strength to promote the physical comfort of these rescued little ones. And to-day, from her heavenly mansion, it is doubtless given her to behold the fruit of those days of care and nights of watching in the transformation

of those little waifs into intelligent, Christian wives and mothers—some of them wives of Methodist itinerants, scattered through the length and breadth of the mission in the Fookien province.

In November, 1859, Mrs. Maclay with her husband and family of six children embarked on the ship *Samuel Russell* for New York. She left their first-born buried under the olive trees in the mission cemetery; and their life work was now dropped for a season in hope of saving the lives of two of their darling children, then seriously ill. But the babe died on the sea.

After a stay of a little more than a year in America, June 1, 1861, Mrs. Maclay with her husband and family again embarked for China. Up to this period our missionaries all still made the voyage to China by sailing vessels. This time it was the good ship *Kathay*, Captain T. E. Stoddard, with whom sailed a large number of passengers, most of them missionaries; among them for Foochow was Rev. Nathan Sites and the writer. It was during this wearisome voyage of one hundred and one days that the writer first learned to know and love Mrs. Maclay. Through all the trials incident to such a long voyage, with five little children on the narrow compass of a ship, she was ever so cheerful, so hopeful, so sure that we were going to that land whither the Lord had called us to work; and such faith and trust in Christ was ever in the foreground of her life that she inspired confidence and zeal in the hearts of all those who had the happiness to be associated with her.

Arrived at Foochow, Mrs. Maclay at once took upon herself all the care of her large family, teaching her children with systematic school drill—there being no provision for the instruction of missionaries' children in Foochow—and bearing the entire burden of the household as few missionary ladies ever have done; now ordering family supplies for the table, or clothing for husband and children; or again explaining and reasoning with caviling Chinese artisans about making some pieces of furniture; or overseeing masons and carpenters engaged in repairing their house; always trying to relieve her husband from every domestic care, that he might be able to give uninterrupted attention to his mission work. Through these busy years she instituted various methods to bring together women to receive instruction in Christian truth. One of her last methods before leaving Foochow was to go along the alleys, among the little dark houses in the region of our Tieng-ang church, talking with poor women and inviting them to come into the chapel next day when they heard the bell ring. Frequently a large number of women and children would assemble in answer to her persuasions. There she would meet them; and in a conspicuous place behind the platform where she sat she had a large tray of cakes and a steaming teapot of immense proportions; and after she had talked and answered questions for a time, they all had a little "cake and tea love-feast" together. She made no parade of self, but worked quietly, feeling that she could do so little; but "when the Son of man shall come in his glory," shall he not say unto her, "Inasmuch as ye have done it unto one of the least of these, ye have done it unto me?"

Thus she continued to work, often through much physical weakness, until May, 1868, when, having prepared her two elder sons for higher school education, and the third being still a very delicate boy, she felt that duty called her to accompany her children to the home land, and remain there with them for a time, guiding and caring for them through those impressible school years. Dr. Maclay accompanied her to Hongkong, and May 26th saw her with all their children on board the Pacific mail steamship *China* for San Francisco. They reached New York in safety, and soon after they went to reside at Pennington, New Jersey.

Here, the following December, the gentle, sweet-spirited child, Charlie, died, after having been nursed through a long illness by his ever tender, loving mother. Through this great sorrow Mrs. Maclay did not murmur that her husband was far away. She knew too well the hopeless despair of a bereaved heathen mother to wish for a moment to arrest his message, as he proclaimed on

China's distant shore, "Behold the Lamb of God which taketh away the sin of the world." Subsequently Mrs. Maclay resided at Middletown, her younger children in the public-schools and her elder sons students in the Wesleyan University. Later she lived in New Haven; also, for a short time, in New York City.

Thus four years passed, when her husband joined her in New York in April, 1872, who, feeling the need of a short respite, had gone home with the expectation of bringing Mrs. Maclay again to China. But instead, a year later, Mrs. Maclay was on her way to Yokohama, Japan. Dr. Maclay having been appointed to superintend the opening of a new mission for the Methodist Episcopal Church in Japan, she accompanied him, taking with her their three younger children. They arrived in Yokohama June 11, 1873. She undertook to acquire the Japanese language, taking it up amid many interruptions.

Her duties were numerous. Among them, not the smallest, was the entertaining of Christian and missionary friends on their journeys by way of Yokohama to China or America. How many such can recall her cordial greeting, the restful "home feeling" enjoyed in her parlor, or at her table, as well as her helping hand and kindly aid in many ways. Many a lady would have considered that these duties of hospitality and household oversight were sufficient for one whose life had been previously so active. But she did not reason in this way. Having fitted her son George for college, he was sent to America. Soon afterward her only daughter was married to an American missionary in Japan. Being then left with only one child—Edgar, the youngest—to teach, she had somewhat larger leisure. This she improved in translating a book for children by the well known authoress of the "Peep of Day." It is entitled "More about Jesus," and will prove a valuable addition to the Sabbath-school literature of Japan. This translation she accomplished amid much physical depression and weariness, probably the premonitions of the disease which terminated her useful life.

In March, 1878, there came to their home a telegraphic dispatch from the home-land conveying the unexpected and thrilling announcement that their son, George Hugh, who was a member of the Sopohmore Class in the Syracuse University, was dead. The sadness of such a message in such circumstances can neither be described nor imagined. Quite possibly this heavy blow shattered, to some extent, the tenement in which dwelt the mother-heart ever beating with such tender love for her absent boy. Mrs. Maclay was in the habit of assisting her husband in his Sabbath work, helping in the Sabbath-school in the native town, or presiding at the organ at preaching services. It was while engaged in performing the last named duty that she was stricken by apoplexy, and swiftly and suddenly came to her the message, "It is enough, come up higher." She had, apparently in her ordinary health, accompanied her husband to the Sunday morning service in Japanese. She led the singing of the congregation as usual, in praising Him whose glorious face she was so soon to behold in righteousness. She listened with close attention to an excellent sermon on Christian zeal, in which the preacher Rev. S. Kurimura, narrated with great effect the incident of the Rev. Dr. Duff fainting on the platform while pleading for India before the Presbyterian Assembly of Scotland. The last piece she played was "In the Christian's Home in Glory." After playing four stanzas and being uncertain whether the fifth was to be sung, she *looked* the question to her husband and he looked back the answer *yes*, which she understood and proceeded with the playing.

This was the last interchange of thought between these wedded lives. Having finished the fifth stanza she bowed on the organ to join the congregation in the closing prayer of the service. But the preacher had scarcely commenced his prayer, when she, feeling that something strange was coming upon her, turned to a friend and said, "Fan me." The movement arrested the attention of her husband, and seeing by the sudden change of her countenance that something very serious had occurred, he

sprang to her side just in time to receive her in his arms as she fell backward. After this she never spoke, and so far as is known never had a moment's consciousness. The notes of the music of that last stanza,

> "Sing, O sing, ye heirs of glory!
> Shout your triumph as you go!
> Zion's gate will open for you,
> You shall find an entrance through,"

had scarcely died away, when the gates of which she had just been singing, swung open for her pure spirit. Every thing that medical skill could suggest was tried, but all was in vain. She lingered until daybreak the next morning, July 28, 1879, when her breathing ceased and she was at rest.

The funeral service took place about five o'clock the next afternoon in the Native Chapel on the bluff close by her home. Dr. Nathan Brown spoke in the English language, and the Rev. S. Kurimura in the Japanese. The remarks of both were fitting, and we close this brief sketch by an extract from Dr. Brown's address.

"Our departed friend needs no eulogy. Her kindly words and deeds are embalmed in the hearts of all who knew her. Her works speak for her, and they will follow her, in China and Japan, in influences that never die. She was a consecrated woman, consecrated with an intensity of purpose that would scarcely be perceived by those who did not intimately know her. In crossing the seas, now alone, now with her rising family; parting with her children at the call of duty; never flinching or faltering in her undertaking, she showed the true heroic element of missions."

Miss Dora Schoonmaker, her fellow-worker in Japan, says: "The one trait in Mrs. Maclay's character which had of late most forcibly impressed me, was her absolute and unreserved submission to the divine will, both as regarded herself and her family. Shortly after she had received the intelligence of the death, in America, of her son George, and while that sore heart-wound was yet fresh, in conversation with her, such were her expressions of resignation that I could not forbear expressing astonishment. Her face revealed the anguish of her heart, but she answered steadily, 'I have never, not even in the first awful moment of hearing the news of George's death, questioned God's right to do as seemed good to him.' Hers was a nature, which, while making little outward demonstration, felt with keen intensity both joy and sorrow; and her submission was no mere succumbing of a weak soul to the inevitable, but that entire surrender of her whole being by which she came to have no will apart from or contrary to the will of God. She was often heard to speak of how inviting the 'Rest of Heaven' appeared to her. She has entered that rest. Out of the work here into the rest and rewards of the hereafter, with no long illness intervening to make necessary the laying aside of her working armor before she was quite ready to receive the victor's 'crown and palm.' Her grave may be seen in the Yokohama Cemetery, a beautiful burial place amid evergreen trees and shrubs and flowers. There, after a busy life, she sleeps well. Not dead! *Alive for evermore.*"

ABELARD.

THERE are two cemeteries in France lying under sunlight and starlight a hundred leagues apart. One overlooks the domes of Paris from the heights of Mont Louis; and one the humble church and humbler homes of Pallet, a lowly Breton town. In sight of one the Seine rolls shining, by the other the Sangueze smiles, no longer blushing with the red of the battles that christened her in blood. Stately portals and watching soldiers guard the graves of one; for the other there is no guard save shrub-filled fosses and moldering, moss-grown walls. To one the countless living come to mourn the countless dead; the other has long been given over to the winds for sighing and to the rains for tears. In one, surrounded by the graves of the great in arms, in science, and in arts stands the Gothic tomb of Abelard; in the other, half-buried with the dead, lie the ruins of the chateau that was his birthplace and his childhood's home.

So a thread of history runs over the leagues of distance and through the years of the life that began at Pallet and ended at Père la Chaise. The hand that grasps it must reach back through centuries. The limits of our space forbid following it with fidelity; we can only glance at the heights where he trod so proudly and the depths where his hopes went down.

Almost from the beginning strange contrasts marked the career of Abelard. Few names of his own day held so high a place in the esteem and envy of the world as his. It shone at one time like a star in a new heaven of thought, and like a star it fell and lost itself in night. Dialectic and ethical triumphs made him at one period the master of mediæval opinion. The most enlightened countries of Europe sent their learners to sit at his feet. Anon we hear his opinions declared heretical and see him covered with humiliation, condemned to place his writings, with his own hand, in the flames. At times he was the idol of the city, the most honored guest in the noblest homes of France, again driven forth to build his cabin of stubble in the desert. He was crowned with admiration to-day, pursued with malediction to-morrow. Bitterest calamities followed in the wake of his gratified ambitions. From the heights of honor he fell to deadly disgrace as from heights of purity he stooped to deadly sin. Retribution scourged his sinful joys into remorseful regrets, and to persecution was added the sting of self-reproach. Surely through strange diversities of character and fate the thread of his life ran on.

M. Victor Cousin has said of Abelard that he was a real Breton. Another writer says of Brittany that the very sea wailing forever against her shores beats as it were against the heart of her people, waking in them her own untamable spirit of freedom. In arms and in philosophy, says Wight, "Bretons have manifested a character of unconquerable resistance." "Pelagius, the first Churchman who was an avowed champion of liberty, who provoked attacks from St. Augustine and Jerome, who denied original sin and would not admit the doctrine of redemption, and the purity of whose life only increased the danger of his heretical doctrines, was a Breton. Descartes, who philosophized as bravely as he fought under the walls of Prague, was a Breton. Soldiers, orators, and poets, great believers and great unbelievers, have been Bretons born. It was a Breton, says Michelet, who at Waterloo said, 'The guard dies, but does not surrender.' The true Breton is a compound of Greek and Celt, and Abelard was a Breton."

His father, Count Beranger, was the lord of the little fortified chateau on the ruins of which a stone cross marks the desolate cemetery of Pallet. Here Pierre was born in the year 1079, when Philip the First was on the throne of France. His father was a soldier who loved books, and in the pauses of war indulged his taste by what scanty literature the few manuscript treasures of Brittany could afford. The son loved no warfare but that of reason and ideas. He

became a student while still a child. A combat of logic inspired him even when of tender years. Enamored of knowledge he lost other ambitions, and voluntarily resigned his claim to the paternal estate, that he might never inherit cares and responsibilities incompatible with exclusive devotion to his loved pursuits.

M. Guizot says of him that he was a logical knight errant, leaving the paternal roof and going throughout the kingdom with lance never in rest, eager for a dialectic tilt, challenging and conquering every logical combatant, learning in every provincial school and leaving it then for the next. Wight calls the beardless youth a peripatetic philosopher, walking from province to province, searching for adversaries, learning from every teacher whatever he knew. Animated by such a spirit in a century when "dialectics was an art, and one skilled in it called a master of arts," it is not strange that almost unconsciously he often found himself on the side of reason and free thought against the authority of theology. Doubtless the influence of Roscelin, to whose lectures he listened while the former was canon of Compeign, did something toward confirming the bent of the young student's mind.

Roscelin's extreme nominalism was already declared dangerous to certain dogmas of the Church, and his works were condemned by a council at Soissons when Abelard was only twelve years old. He must have become, long before he reached manhood, conversant with the controversy of Realism as supported by Anselm, with the condemned system of his teacher, and probably did not rest until his mind had grasped the arguments of both. Certain is it that he thought for himself at an early age, and did not hesitate to contradict the theological views of his elders.

And while the lad was spending the years in study, testing the strength of his weapons of logic on every adversary, and becoming known through the country as old in knowledge and subtlety of debate, the heart of France was throbbing with the madness (or the inspiration, which shall we call it?) of the Crusades. Men, women, and little ones, multitudes uncounted, went forth under the red cross banner to see Jerusalem redeemed, and saw instead, alas, too many of them, only the gleam of the jasper walls and the city not made with hands. But though the fever of consecration burned in every city and village of France, it roused no enthusiasm in the heart of young Abelard. The fire of religious feeling does not seem to have lightened his mind or warmed his soul, and one conversant with the history of that period needs no better evidence of Abelard's cool and logical nature than that it withstood the excitements of the greatest movement of the Middle Ages. He cared for ideas, not emotions; for reason, and not sacrifice.

Intent on progress he did not linger long to waste his controversial skill upon the provinces, but before he was twenty years of age sought Paris, where he gave himself to the study of music, astronomy, and such arts and sciences as he had not yet acquired. In mathematics he never excelled, and his despondency on this account is said to have given rise to his surname. His teacher, observing his depression, told him that a great scholar like himself could not "bajare lardum," "lick up the fat." These words became a nickname among his fellow students, which was finally corrupted into Abelard. Up to this time his instruction had been provincial, and it was hardly to be expected that his supremacy as a logician would be maintained in a city where his adversaries would be legion. Paris had no university in this day, but episcopal schools under Church supervision drew thousands of students from all over Europe. The pupils were not common people, but largely composed of those destined for the Church. Most learned professors, usually high Church dignitaries, lectured to the youth, and for students to question ritual doctrine or dogma was the height of presumption, if not a sin. For all these advantages, no school was so renowned and no professor so distinguished as the one chosen by Abelard.

Enrolled as a pupil at Notre Dame, under a dialectician of such long established reputation as William of Champeaux, called from his towering ability the "Column of the Teach-

ers," began the student's new career. Up to this time only admiration and deference had met his efforts and victory rewarded all encounters. Now all went smoothly while the new disciple's views conformed to those of his master, but when the arrogance of youth, united with undoubted superiority of intellectual force, made Abelard an antagonist of the teacher whose fame made Paris to the rest of Europe what Athens had been to Rome, there was lighted a fire of envy and jealousy that never afterward ceased to burn. It was more than a personal conflict of dialectic skill. Abelard called it a war of ideas; his master called it a conflict between reason, which is radical, and faith, which is conservative; and fancied he fought for faith, when he fought to maintain his own supremacy. Neither had learned the great truth that reason and faith at their best clasp hands in friendly alliance.

From the wandering student life in Brittany to Paris, the center of art and learning, from the modest pupil's place at the great professor's feet, to the head of a rival school, attacking his master's doctrines, refuting his reasoning, winning his disciples to swell his own train of admirers, was a long road swiftly traversed. However interesting as an episode in a romantic personal history, it is much more so when we consider it as the beginning of protests of mind against ecclesiastical authority, of the assertion of right of inquiry, of the battle of ideas against creeds, which culminated in the Reformation; when all influence was ecclesiastical, when the monasteries were the treasure houses of learning as well as the strongholds of power, when to doubt and dispute unsuccessfully was to hasten one's own destruction and disgrace, and to do it successfully was unknown. Braving the danger, the daring Abelard pushed forward with his work. So many became his listeners, that, finding his teachings interdicted in Paris, he opened a school in Melun, where, surrounded by his pupils, attracted from nearly every other teacher, he established a reputation for erudition and subtile vigor of intellect that left all his rivals behind. From Melun he moved his school still nearer Paris, and from Corbeil continued to harass his old master by the knowledge of his success and by the turn of new controversies and defeats.

Under the excitement of intense study and ever restless ambition, his health failed utterly, and he was forced to return to Brittany and take two years of rest in the home of his youth. At the end of this period back he came, armed with new vigor and unwavering determination.

Again as a pupil he sought his old master, William of Champeaux, who had resigned his influential position as head of the cathedral schools, and had retired to a monastery, where, surrounded by pupils, he still pursued his work of secular instruction. To this school came Abelard, and at first he was a quiet listener to the lectures in rhetoric. It was not long, however, before the old debates between master and pupil were fiercely renewed. "The question of nominalism and realism," says M. Cousin, in his "Œuvres Inédits d' Abelard," "was then the dominant question in dialectics, and made a sort of touch-stone of masters and scholars." William maintained that ideas are essences, that names are things; in short, he was as exclusive in his realism as had been Roscelin in his nominalism, and Abelard, offering conceptualism as a substitute for both, combated their arguments and conquered both, defeating William so disastrously that it wrecked his reputation as a philosopher, and caused many of his pupils to abandon his school. Of the theory of conceptualism, whose formula is that universal ideas are the expression of conception founded on facts, Abelard is claimed as the inventor.

From this triumph Abelard went back to the metropolitan school of Notre Dame in Paris. Here William of Champeaux, on abandoning the work, had appointed his own successor. The successor quietly vacated the chair for Abelard's occupying, and took his seat among the pupils. But the jealous rage of his old master could not endure this new humiliation, and his removal was effected by the removal of the master and the substitution of one who could be made a tool of Champeaux.

In his unquenchable ambition, satisfied that his genius and learning entitled him to the post of educational honor as master of the cathedral school at Paris, and indignant at the injustice which shut the city gates upon him, he retired to Melun and resumed his lectures, continuing them until his disciples numbered a small army, when he marched them to Paris and camped with them outside the walls on the heights of St. Genevieve. Here he lectured, sometimes in the open air and sometimes in the cloisters of the church.

There could follow but one result. Says one writer, "Even his enemies praised his sublime eloquence and his science that bore every test. Clad in impenetrable coat of logical mail, he provoked combat and slew by the first stroke of his terrible dialectic lance. He was swift as Achilles, strong as Ajax." Outside of Paris or in it he was master. The pupils of Notre Dame left their professors to swell his student ranks.

Having thus besieged Paris, he was erelong welcomed with open arms to the position he had conquered, and was placed at the head of public instruction. Influential as was the post, nevertheless nature sends him after a time in search of new worlds to conquer. There no longer exist any teachers of philosophy whom he has not left behind; but at Laon, Anselm, the venerable teacher of theology, whose reputation is world-wide, and who was himself the teacher of the vanquished Champeaux, is drawing to his lectures crowds of pupils from all over the continent of Europe. Abelard goes also and enrolls himself among the pupils of Anselm. He also would become a theologian; it is his only unconquered field. Little time is needed to measure his master's learning and strength in comparison with his own. He speaks slightingly of his expositions; calls his rhetoric "fine foliage on a barren fig-tree;" when he kindles a fire there is smoke but no light. Anselm's disciples, naturally enraged, challenge the upstart to prove that he can do better or as well. He accepts the challenge. The prophecy of Ezekiel is chosen as being most difficult to explain, and Abelard bids them to his lecture on the following day. His friends endeavored to dissuade him from an attempt so rash and so irreverent, before an audience composed of the best theologians of the day. His foes sneered, but friend and foe alike listened in wonder to the lecture that resulted in the establishment of another chair filled by a young man never yet an acknowledged student of sacred science, yet who threatened to take the pupils from the most distinguished theologians of the day.

Naturally Anselm forbade this work to go on, and Abelard returned to Paris, where now all schools were opened to him, and where he entered upon the most brilliant portion of an unexampled career. "No one remained to dispute his supremacy; he was the acknowledged intellectual ruler of Europe, the highest authority in science, a dictator in the republic of letters." He was made rector of the schools; some authors say also canon of Paris, but others deny his having been made canon without being priest, and there is not sufficient evidence of his having become at this time a priest. There is no doubt, however, that at about this time he decided to work with and for the Church, to use its influence and to allow it to use him, in so far as was needful to secure its advancement and emoluments.

He did not give up the beginning he had made in theology, but went on in Paris with his exegesis of Ezekiel's prophecy, abandoned at Laon. In so marked a degree did he apply philosophy to theology that he may be said to have been the founder of scholasticism (properly so called). The position of Abelard in the philosophical movement of his age is well described by M. Cousin: "A hero of romance within the Church, a refined spirit in a barbarous age, a founder of a school, and almost a martyr to an opinion, every thing conspired to make Abelard an extraordinary personage. But of all his titles that which gives him a separate place in the history of the human mind is his invention of a new philosophical system, and his application of this system, and of philosophy in general, to theology."

Now came his hour of triumph. Says one author: "The enemies as well as friends

of Abelard testify as to the number of his pupils. Fabulous as it all seems, authorities agree that there was no exaggeration. "The noblest young men of the civilized world were among the five thousand pupils that listened daily to his voice. They came from Germany and England and Italy. Among them was one man who was afterward made pope, eleven who became cardinals, more than one hundred bishops, archbishops of France, England, or Germany, besides many names left in history as distinguished in the political world and conspicuous in the affairs of nations."

"In the midst of this attentive and obedient multitude was often seen passing a man with a large forehead, with a vivid and fiery look, with a noble bearing, whose beauty still preserved the brilliancy of youth, while taking the more marked traits and the deeper hues of full manhood. His grave and elegant dress, the severe luxury of his person, the simple elegance of his manners, which were by turn affable and haughty, an attitude imposing, gracious, and not without that indolent negligence which follows confidence in success and the habitual exercise of power; the respect of those who followed in his train, who were even arrogant to all except him; the eager curiosity of the multitude,—all announced a master, the most powerful in the schools, the most renowned in the world, the most loved in the city. Paris had adopted him as her child, her ornament, her delight. Crowds stopped to gaze as he walked the streets, and women pulled the curtains from the little window-panes as he passed by. Paris was proud of Abelard, and celebrated the name of which, after seven centuries, the city of all glories and oblivions has preserved the popular memory." (Vie d' Abelard, by Charles de Remusat.)

On a plateau half-way to the summit of Vesuvius travelers pause to rest. We look upward to the bare, desolate peak. From its yawning side the gray smoke goes up to dim the sunshine. The wind drifts to our faces laden with dust and ashes. A strange moan comes and goes with every breath of smoke, and a slender fiery tongue darts forth now and then for a moment, as if some soul in chains sought in the bending clouds the hidden finger of Lazarus. We look backward. The olive groves through which we passed are away in the valley out of sight, the orange blooms that sweetened the morning air are far below; the cottages, at whose doors the children played, the vines on the slopes, the flowers in the garden,—we have left them all behind. Between them and us lie fields on fields of lava, black desolate, strange, distorted into fantastic shapes; a river of fire suddenly stopped in its flow—a river in whose track all withered that was fair, and all that was weak was wrecked. Saddened, we linger midway on the height and ask, why should we struggle onward up the mount, only to trace the wreck and ruin step by step, and to gaze a moment into the throbbing heart of flame?

So, midway in this life, hitherto so brave and fair, we pause and question why we should go on. Over it at this period passed the fiery flood, and in the burning track of sin went down the nobleness of his manhood; the splendor of his fame; and, sadder than all, under it shriveled the life of the only woman of his age fitted to be the mate of such a man. The romance that has survived a decade of centuries needs no revival as does his forgotten scholasticism. All know the shameful story of how, under the pretense of cultivating her mind, he won the heart of Heloise. That she gloried in offering herself as a sacrifice to his ambition does not ennoble his acceptance of her gift. Neither is there excuse in the peculiar bitterness of the attitude of the Church at that period in reference to marriage of the clergy, nor is there defense for him in the frightfully low estimate of the value and virtue of womanhood in that less enlightened age. The fact remains that he loved her with the love that spared himself at the cost of the object beloved. The story is as old as human history. The scene of its first chapter is laid in Eden.

An unacknowledged marriage was destruction and shame to her, was expedient for him. Therefore she chose it, and when circumstances forced him to reveal it, she still

persistently denied. She preferred to lose the crown and glory of womanhood rather than that one ecclesiastical advantage should be lost to him. Before the marriage occurred she resisted it with arguments and reasoning as subtle as his own, but her logic was saturated with her love. Gladly she fled with Abelard to his mother in Brittany; gladly came back with him to share the wrath of her justly incensed uncle, whose name her flight had disgraced. When the marriage was on every lip, and her uncle's reproaches and abuses, increased as they were by her continued denials, grew insupportable, she took refuge at her husband's suggestion with the kind nuns of Argenteuil, in whose convent she had passed her childish years. Here she remained until Abelard, embittered and irritated at the failure of his ecclesiastical ambitions, and the results of his sins, decided to abandon the world and enter the Monastery of St. Denis. Then at his command she took the veil, that, at nineteen years of age, shut the world and its pleasures forever from her gaze.

The lava tide has swept pitilessly over her life, and has not left his unscathed. Henceforth for her, convent days poisoned with regretful remorse; days in which from matins to vespers she meets her appointed tasks, still cherishing in her secret soul the memory of Abelard. And henceforth for him, embittered years, of secret rebellion at the life he had espoused, of slow and partial submission of heart, and of ever-recurring resistance of mind. He bowed his spirit to the behests of the Church, but chafed continually under the fetters she forged for his thoughts.

Some one speaks of the renowned monastery of St. Denis as "long the pet of kings." Proud as the brothers were to receive the philosopher into their number, they yet felt he should be equally proud to come. Alas for their hopes, the new acquisition was less an ornament than a "means of grace." Morose, irritable, pitiless in his scathing criticism of their minds and morals, he soon rendered himself so obnoxious to the fraternity that they united with his disciples in urging him to return to his work of instruction. Reluctantly he opened his school at the priory of Maisoncelle, and soon three thousand students sought the obscure place that supplied them with neither lodging nor food to listen to his lectures, while other schools were proportionately diminished. Saddened by his experience, his teachings savored more of religion than formerly, and his work, entitled "Introduction to Philosophy," issued about this time, attracted great attention; but both teaching and writing seemed to arouse ecclesiastical envy, and enemies both within and without the Church were stirred against him. His right to teach was questioned; his theology declared unsound. Alberic and Lotalphus, his fellow pupils with Anselm, of Laon, and fellow plotters against him, succeeded in having him brought before a council at Soissons, convened for the special purpose of trying Abelard, accused of applying in his book the principles of nominalism to the doctrine of the trinity.

The common people of Soissons had been so prejudiced against him that one of his disciples came near being stoned in the street; but during the days of the council Abelard addressed the people, and by his eloquence made friends of foes. He begged for a careful examination of the teachings of his book, and offered to retract any thing contrary to the doctrines of the Holy Catholic Church, but the council found him guilty of the heresy of Sabellius, that is, of having denied the reality of three persons in the trinity. He was judged, says one, "without discussion, condemned to throw his book with his own hands into the fire, and handed over as a prisoner to the abbé of St. Medard."

A swift reaction followed this spirit of persecution resulting in his reinstatement in his own convent of St. Denis, where he again aroused the enmity of the brothers by expressing his doubt that Dionysius the founder of their order, had ever set foot in Gaul. Such was the storm of anger aroused against him that excommunication was threatened, and such the confinement and close watching of Abelard that he fled by night, and took refuge in a little priory

in Provence, from which he wrote back to his convent explaining the ground of his opinion and making many concessions. The difficulty was finally settled by Abelard's obtaining permission to separate himself from the abbey with the privilege of choosing his own residence providing he joined no other community.

And now, left to choose a home, he whose eloquence moved multitudes went to the wilderness on the banks of the Ardusson near Troyes. Here, alone, he fashioned a small hut of rushes, built of the branches of trees an oratory, and gave himself up to solitary study and thought. But the world he had left could not so readily leave him. Students flocked to his retreat, importuned him for instruction, surrounded his hermit's cell with huts, and the wilderness school at a year's end numbered six hundred thoughtful men. Then, to supply the need of a place of worship, with the consent of the bishop of Troyes, a building was erected and solemnly dedicated to the Comforter, to the Paraclete.

Rapidly Abelard's power increased; but with his influence over the minds of his followers grew also the enmity of the ecclesiastics who feared him and envied his control of the new generation of students now flocking to his feet. "Formidable representatives of ecclesiastical authority grew more and more antagonistic to this formidable representative of reason."

St. Norbert, with the care of his nine abbeys on his hands, yet found time to condemn the work of Abelard; though, as his biographer fitly says, "the mystic mind of the zealot could never have appreciated the intellectual Christianity of the theological dialecticiau."

Not far from the Paraclete was the celebrated Monastery of Clairvaux in the so-called Valley of Wormword, where dwelt Abelard's most powerful enemy, the mighty St. Bernard. Mighty in personal sacrifice and influence, a man to make a king withdraw a threatening army with a word; to settle who should occupy the papal throne, and so sway the hearts of men that women kept their husbands and sons from hearing him, lest they forsake wife and sweetheart to become monks. In the track of his travels miracles were wrought; when he passed people trod upon each other to touch his garment's hem. None who heard resisted his fiery words, and he used them unsparingly against the dweller in the rival abbey, the champion of reason, who was also, to St. Bernard, the enemy of faith.

The saint feared the philosopher's influence over others, the philosopher feared that of the saint against himself, and became very apprehensive lest he should be dragged before a council for heresy. We have no better indication of the change in the spirit and courage of Abelard than we find in the fact that to escape persecution he was even willing to give up his beloved retreat; that he who had been unsparing in invective against the ignorance and vices of the convents, who attacked even popes, who accused high dignitaries of attempting false miracles, who spoke as boldly as ever Luther did against the traffic in indulgences, was ready to go into the coast of Brittany and take charge of the monastery of St. Gildas, where, instead of returning with unanswerable eloquence the charges of his enemies before the most enlightened throngs in Christendom, he must find his work amongst a class of coarse, untutored, and disorderly monks.

It was not the field for him, nor was he the proper guide for the unruly and turbulent spirits under his charge; and while he stayed and did his work, the sea that beat against the cliffs on his own Breton shore was not sadder or more restless than his life. Through his unrest came a chance to be a comfort to Heloise, who had passed the ten years of silence within the convent walls of Argenteuil and had been made prioress there.

The monks of St. Denis, never too friendly to the wife of Abelard, claimed and proved their right to the property occupied by the nuns. The convent was broken up, the sisters scattered, Heloise was homeless. Then it was that Abelard hastened to Troyes and offered to her and her followers the forsaken Paraclete as an asylum. He made an unreserved gift of the property,

approved by the bishop of Troyes and afterward by the pope. Heloise, now in her thirtieth year, took possession of the house, assumed the authority as abbess, and almost at once commanded the respect and affection of the neighboring people. Privations awaited them at first, but gifts from Abelard's old students and friends poured in upon then, till, says Abelard himself, "they were enriched more in one, than I should have been in a hundred years."

This work accomplished, back again to St. Gildas, where misrule and enmity had come in his absence and new troubles awaited his return. In travel he feared assassins, even in celebrating mass he feared poison. Refractory monks sought his life, and he was forced to flee to the sea by a subterranean passage, and to find a secret refuge with a friend. From this temporary asylum he wrote his celebrated "Historia Calamitatum," which was not only an account of events, but a record of thought and of the emotions of his heart. This history fell into the hands of Heloise and called forth the remarkable letters that have more than any thing else kept alive the romance of her life for more than eight hundred years. This correspondence is worthy of a chapter by itself, as giving the best revelation of the mental power and the almost unequaled pathos of devotion of Heloise. Some one has said not untruly that the letters "are full of human love and longing, though nothing is uttered of either, and that God is not in them, though they speak only of God." Yet taking Abelard's, all in all, they prove him less a sophist and more a Christian than most of his works declare.

Heloise's letters in their freshness and vigor of feeling are like green olive trees growing in the crevices and on the edges of the blackened lava beds. His to her, notwithstanding their pious pedantry, show a lingering pleasure in the writing that makes one feel his mind had found a little oasis in its desert existence. This was, indeed, his only tranquil year. Now he wrote or finished, says Cousin, his works, collected his sermons, wrote his "Hexameron," a "Commentary on Genesis," and a book of hymns.

He opened again his school on the hill at St. Genevieve. Persecution ceased. The king was his friend, his opinions were respected, his old pupils held the highest places in literature and in the Church.

It looked like peace, but St. Bernard was not yet dead. Through him the quarrel with the Church was revived. Conflicting views ended in personal animosity. The saint accused of heresy, the sophist defended his doctrine and example, and at last when the flame of antagonism waxed hot, Abelard demanded public proofs of the charges against him. At Sens there was to be on the Octave of Pentecost a great exhibition of relics, at which the king, Louis VII, was to be present, with princes, rulers, dignitaries of Church and state.

Abelard wrote to the archbishop of Sens, asking that this assembly might constitute a council, before which he might answer his adversary and vindicate his faith. The archbishop consented and wrote to St. Bernard to appear and make good his accusation. St. Bernard replied that Abelard's writings were enough to condemn him, and in the presence of an assembly composed of the noblest of France, king, princes, and scholars, the adversaries met;—St. Bernard, lowly of mien, Abelard haughty in bearing. Upon one the common people pressed only to touch his garments, from the other they shrank in dismay. From the works of Abelard twenty-seven passages were chosen by St. Bernard to be read before the council.

In the midst of the reading, Abelard, seeing his fate in the face of his judges, amazed the audience by a sudden appeal to the pontiff at Rome. Nevertheless, the reading went on, the passages were condemned as heretical, and immediate steps were taken to influence the decision at Rome. St. Bernard put forth all his power. Abelard set out on his journey to plead his own cause before the pope, but though he made all speed the report of the council was before him. Its accusation said, "He makes void the whole Christian faith by attempting to comprehend the nature of God through human reason. He ascends up into heaven, he goes

down into hell. Nothing can elude him either in the heights above or in the nethermost depths. His branches spread over the whole earth. He boasts that he has disciples in Rome itself, even in the College of Cardinals. He draws the whole earth after him. It is time, therefore, to silence him by apostolic authority."

Long before Abelard reached Rome it was too late. At Cluny, where he stopped to rest, news came to him that what he most feared had already occurred, he had been condemned unheard—condemned as a heretic to perpetual silence, his books to be burned and himself held as a captive in whatever convent would best serve the purposes of a prison.

Broken in heart and in health, this last blow was one from which Abelard could not rally. Peter, the venerable abbé of Cluny, treated him as a distinguished guest, secured, in Abelard's writing, a confession of faith, and the pope's permission to let him remain at Cluny. He tried, moreover, to reconcile him to St. Bernard, and smoothed in every possible way the path down which his prisoner moved swiftly toward the grave.

Already, perhaps, it might be said, the end of his life had come. Not more perfectly does the lava shroud in blackness the flowers on the volcano slopes, or the cloister's somber robe hide the throbbing heart of Heloise, than did the mantle of silence and submission smother the hopes of Abelard. He was as dead to the world in the stillness of Cluny, saying masses, teaching theology (out of which at last he left all "noxious innovations"), fasting and walking in sackcloth, as he was a few months later when the kind abbé of Cluny sent his dead body home to Heloise.

Very gently the venerable Peter broke the news to her, writing, among other consoling words, that "the present of Abelard's presence was the richest gift that Providence could have bestowed upon his house." "The man," he adds in the same comforting letter, "who by his singular authority in science is known to all the world, and illustrious wherever known, has learned in the school of Him who said, 'I am lowly of heart,' and it is but right to believe he has returned to him."

"The influence of Abelard," says De Remusat, "on the minds of his contemporaries and on the course of mediæval thought was great, but he would have been little known in modern times but for his connection with Heloise. Not until M. Cousin in the present century issued the collection of 'Ouvrages Inédits d'Abelard,' could his philosophical work be judged." Cousin, says Lawrence, "who studied him with ardor, thinks him one of the two philosophers of France, the other being Descartes. He says in effect of both, 'They were Breton born, they had the Breton confidence in self, and contempt for opponents, more logical connection than solidity in their opinions, more sagacity than comprehension, more of vigor in temper of mind and character than of elevation and profoundness in thought, more of ingenuity than common sense, satisfied with their own views rather than rising to universal reason."

"Yet the spirit of controversy, at once the vice and the honor of scholasticism, could alone be introduced into theology by the introduction of dialectics. Abelard as the chief author of that introduction is then the founder of the mediæval philosophy; so that France has not only given to Europe, through Abelard, the scholasticism of the twelfth century, but she has given, in Descartes, the destroyer of this same scholasticism, and the father of modern philosophy. The latter recognized no authority but that of reason, the former introduced reason into authority. Both doubt; both investigate; both seek to know all that is possible to know, and to rest only in certainty."

Says Remusat again: "The general value of Abelard's work lies in his having given, as had no one before him, a formally rational exposition to received ecclesiastical doctrine. Through him was prepared, in the Middle Ages, the ascendency of the authority of Aristotle. He applied the idealism of Plato to the dialectics of Aristotle, and was the chief interpreter of the latter to the mind of Europe."

Of the various collections of his works,

the earliest was that made by Amboise and Duchesne, and published in Paris in 1816. The best narrative of his life is his own autobiographical sketch entitled "History of my Calamities." Pope has versified some of the supposed letters of the lovers. In English we have no less than three "Lives of Abelard and Heloise." In French there are De Remusat's volumes, Madame Guizot's "Essai sur la vie et écrits d'Abailard et d'Heloise," and ten years later France gives us the works of Mons. V. Cousin. In Berlin, in 1806, was published Fessler's work on the Biography, and in 1855 Göttingen gives us another by Wilkins, so that it has had as much attention perhaps as its importance demands.

Most of the authors consulted give to the genius of Abelard and to the devotion of Heloise full measure of admiration; and one who reads can but feel that if his own age gave him (Abelard) sharper criticism than he deserved, modern critics have erred upon the other side. Hallam stands almost alone in the severity of his judgment, and even he calls him almost the first to awaken mankind in ages of darkness to sympathy with intellectual excellence, and says the revival of European literature owes much to the ardor of this solitary student. But he smites with unsparing hand his impudent vanity that, in scorning the dullness of many contemporaries, included the regularly acquired reputation of older and better men. He says his theories were ever just on the borders of heresy, and calls his whole life a shipwreck of genius—a genius the source of his own calamities and unserviceable to posterity. However much of the adulation or condemnation that has fallen upon his life the future may confirm, matters nothing now to him who to the restless life of earth has added nearly a thousand years. He, in whose sight the thousand years are as one day can counteract the evil and overrule the good. To us the chief value of the history lies in the warning it gives against the intense self-hood that too often permeates and degrades what is mistaken for a Christ-like and noble ambition.

Twenty years after the burial of Abelard in the chapel of the abbey of the Paraclete the crypt was opened again and Heloise was laid to rest. For three centuries they slept side by side. Then, after several removals, when in 1792 the Paraclete with the other French convents was destroyed, their remains were preserved, and in 1800 removed to the Jardin du Musée Français, where M. Alexander Lenoir, the founder of the Musée, had a beautiful sepulchral chapel constructed for them out of a portion of the ruins of the Paraclete and of the abbey of St. Denis. And this tomb with the ashes of its occupants was, in the year 1817, removed to the cemetery of Père la Chaise. Some one has said, "If honors at a tomb make a man a hero, Abelard ranks next to Charlemagne and Napoleon. The little gate of the Rue St. André in the city of the dead is hardly ever shut. The workmen spend a few sous to buy a votive offering for the tomb; the flower-girl saves from her stock a handful of roses; the rough laborer of the Faubourg St. Antoine is tamed into courtesy at the spot." The hand of the vandal relic-seeker has not spared it; many of its more delicate sculptures have been destroyed. Soldiers and statesmen, artists and poets, some of the greatest names of the great years of France are here, but no grave is more frequently visited than that of Heloise and Abelard.

ABOVE THE STORM.

THE winds of the Winter have breathed their dirges
  Far over the wood and the leaf-strewn plain;
They have passed, forlorn, by the mountain verges
  Down the shores of the moaning main;
And the breast of the smitten sea divides,
Till the voice of winds and the voice of tides
Seem blent with the roar of the central surges,
  Whose fruitless furrows are sown with rain.

The pines look down, and their branches shiver
  On the misty slopes of the mountain wall,
And I hear the shout of a mountain river
  Through the gloom of the ghostly gorges call;
While from drifting depths of the troubled sky
Outringeth the eagle's wild reply,
So shrill that the startled echoes quiver;
  And the veil of the tempest is over all!

O groaning forest! O wind that rushes
  Unfettered and fierce as a doom malign!
How the pulses leap, how the heart-tide flushes
  The temples and brow like the flush of wine,
As I pause, as I hark to the vast commotion
Of the air, of the earth, of the wakened ocean;
And my soul goes forth with the storm that crushes,
  With the battling foam and the blinding brine.

Yea, my soul is rent by a tempest stronger
  Than ever was Nature's, with ruin rife,
And the flame of its lightnings can bide no longer,
  Ensheathed at the core of a clouded life;
And its pent-up thunders, unloosed at last,
Keep time to the rhythmic rage of the blast,
For my spirit, half-maddened by fates that wrong her,
  Is shaken by passion, and hot with strife!

Ah God! for the wings of the eagle above me,
  With their steadfast vigor and royal might;
Ah God! for an impulse like theirs to move me
  In endless courses of upward flight;
The clouds may billow, the vapors heave,
But still his pinions the darkness cleave;
And proudly serene in those realms above me
  He is soaring from conquering height to height:

Till at length, his great, broad vans at even
  And stately poise on the airy stream,
I mark through rifts of the turbid heaven
  His form outflashed like a winged beam:
And I ask, "Shall *my* spirit soar like this?
Shall it ever soar in the peace and bliss
Of the shining heights and the glory given
  To the will unvanquished, the faith supreme?"

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

Δικαιοσύνη διὰ πίστεως.

THE most momentous question that was ever asked by any man, in respect to his spiritual affairs, is that uttered by the patriarch of Uz, in response to the cavilings of his strange comforters, "How should a man be just with God?" That utterance is indeed in the form of an inquiry, but in its tone and character it is rather a cry of despair than the expression of a hope. The same question, with nearly the same conditions, is perpetually arising in men's religious consciousness, not especially of great sinners, but equally so of the best instructed and the most thoughtful. Nor is this a peculiarity of the Christian consciousness, for the same earnest questionings may be detected at all times and under all forms of religious faith. To render to it a satisfactory answer has been the final purpose of all systems of religious instructions and observances, the multiform *cults* of the various races of men. Especially is this the case in respect to the religious system given in the Bible, which system first suggests, with unequaled clearness and force, the inquiry itself, and then proceeds to find out and declare its answer.

The relations subsisting between man and his Maker, as disclosed in the Holy Scriptures, have respect especially to matters of ethics, *the right*, and its opposite. The attributes of the divine person have their natural and intellectual side, in the forms of *power* and *knowledge* and *ubiquity*, which, as they enter into our conceptions, are without moral qualities: but our most intimate and least inadequate conceptions of the character of God, take especially cognizance of his essential righteousness, which, contemplated abstractly, is called *holiness*. And having made man in his own image—that is, a rational soul, of which the moral element is the crowning attribute—and designed to accomplish the high purpose of his being, in union with himself, God requires of man that he, too, shall be righteous; *holy*, as God is *holy*. And as the divine mind is essentially and necessarily judicial, he must approve or condemn his creatures, according as they are or are not found to be righteous before him. His approval is our *justification;* his disapproval is the detection and declaration of our *guilt*, implying on the one side condemnation to condign punishment, and on the other *wrath*, to be made effective in righteous judgments. And because there is in men's spiritual intuitions that which awakens fearful misgivings in respect to the possession of this needed conformity of the soul to the divine pattern, a fearful importance attaches to the inquiry as to the possibility and the way of becoming "just with [or before] God."

An examination into man's moral estate, whether by ascertaining God's infallible estimate of the case, or by consulting the deliverances of the soul's intuitions and resultant consciousness, brings abundant proof that he is unrighteous. Sin [itself a word having a specific and peculiar sense, as used in this relation] is the distinctive characteristic of the human race, and of each of its individual persons. "All flesh has corrupted its way upon the earth." But because of its paralyzing influence over the soul's perceptions, the greatest sinners are often the least aware of their own moral and spiritual estate. In proportion, however, as the soul is quickened by the Holy Ghost, to know itself, and properly to understand its own relations to the divine judgments, it becomes conscious of its sin and guilt. *Self-condemnation* is the direct and immediate result of the soul's perception of God's righteousness, and its own unrighteousness. It is the office-work of the promised "Comforter" to "reprove" (*convince* by inward illumination) of *sin* in the subjective soul, of *righteouness* in God and in his law, and of "*ju-*

ture judgment" against the unholy and unjust ones.

Consciousness of guilt, though always the same in kind, varies in its forms and aspects and degrees of intensity with the degrees of spiritual quickening and illumination. It is often first seen, and most fully appreciated, in respect to matters of social duty. Sins against one's neighbor are most readily detected, and men judge of themselves, as good or bad, according to the degrees of their justice and mercy, and of natural affection and brotherly kindness. But with a deeper and clearer spiritual enlightenment comes the recognition of God, of the exalted holiness of his person and his law, and of the certainty and fearfulness of his judgments. Sin, then, appears to be essentially and pre-eminently against God, a dishonoring, an offense, and an active antagonism, which magnifies beyond all finite estimates its wrong, and its ill-deserts. The real substance and inbeing of sin is found to lie deeply imbedded in the soul itself, as an all-pervading and dominating condition, out of which, as streams from the inward fountain, proceed all manner of specific transgressions and outward *sins*. All this is very clearly and also very painfully presented in the fifty-first Psalm, which opens with a confession of a specific transgression, which, though primarily against a fellow-man, is still confessed to be pre-eminently—the language makes it *exclusively* so—against God. But the quickened soul of the penitent culprit sees in his evil doings more than a *formal* act of wrong. He finds its source deep down in his spiritual nature, a hereditary depravity of a soul shapen in iniquity and conceived in sin, and therefore he prays especially for a transformed and renewed spiritual nature. And all this which was, in the first place, personal and specific, in the case of the royal psalmist, is recorded under divine appointment, as a mirror into which all men may look; and with this fearful exhibition of sin is also revealed God's method of saving men from its consequences and its inbeing.

Sin is, first of all, and foremost in the discussion of the subject, *ἀνομία*—something essentially and actively out of harmony with the divine law of essential righteousness, occasioning guilt in its subject, and calling for just retribution, in the visitation of wrath. It is also a *lust* of the soul, occasioning helplessness against the law of sin in the soul, with depraved moral appetencies, and active proclivities towards evil, and the obscuration of the soul's inward perceptions of right and wrong. When aroused from this state of spiritual torpidity, this death in sin, and with the first impulse of the awakened soul to escape from its ruinous condition, comes the knowledge that sin is a law as well as a disease,—a tyrant whose chains upon the soul can not be rent asunder,—"a strong man" holding his house with a strong hand. And now the soul itself seems to have become *dual*, and self opposes self; but the sinful self always triumphing, till a mightier one comes to the better soul's rescue and binds the strong man, and spoils his house. These three things must therefore be recognized as pertaining to, or resulting from the innate sinfulness of mankind: (1) a condition of spiritual unlikeness to the divine image of holiness; (2) a state of legal condemnation, exposing to the judgment of wrath; and (3) an enslavement of the whole moral nature—perceptions, affections, and will—to the service of sin. How to be delivered from this "body of death" is the tremendous problem that demands solution. There must also be recognized in the lost state of man his loss of the conscious presence of God, for which he was created, and without which he can not possibly attain to the high place for which he was destined, and in this state of separation there is perpetual want, with sorrow and wretchedness, arising from insatiable, but ever unsatisfied desires. A sense of this absence from God is among the results of the Spirit's quickening and enlightenment of the soul, with which also comes the desire to find God, and to be reunited to him. But how this can be effected is not easily determined. He is not only unsearchable by reason of his greatness, but he is very far above the low plane of spiritual being into which sin has depressed men, and out of which they have no power to raise themselves. He is, indeed, very near to all his works, and yet he is hidden from all except "the pure in heart." "Lo, he goeth by me, and I see him not," was the sad lament of the suffering patriarch; "he passeth on, also, but I perceive it not." And out of this sense of the sadness of his separation, with conscious guilt as its cause,

comes the desponding confession, "Whom, though I were righteous, I would not answer, but I would make supplication to my judge." The consciousness of ill-desert, of depravity and spiritual defilement, forbids the soul's approach to him "who is of purer eyes than to behold iniquity;" and in such a case the soul instinctively asks for an intercessor, that may bridge the awful chasm between itself and God,—for a "daysman that may lay his hand upon us both."

The notion of mediation and vicarious sacrifice for sin, which pervades the whole Bible, seems also to be an intuition in the conscience oppressed with the sense of sin against God. The cry of the prophet, "Will the Lord be pleased with thousands of rams, or with ten thousands of rivers of oil? Shall I give my first-born for my transgression, the fruit of my body for the sin of my soul," illustrates the instinctive tendencies of men's minds towards vicarious offerings for sins, and also the feelings, that all that could be brought would still be insufficient to redeem. And not only were the fruits of the earth and the blood of dumb animals offered, as God himself had ordained, as a relief to troubled consciences feeling after God, and also as a figure and pledge of that better sacrifice which he had ordained, but there was a strong and constant tendency to give in sacrifice the lives of human beings, to shed human blood for the redemption of men's souls. The abominations of Moloch were the practical outworking of what is seen less clearly in the cases of Abraham and Jephthah. And yet all these failed to satisfy men's consciences; the offerings were continually repeated, each new one discrediting its predecessors. The sense of guilt remained, and the question was ever recurring, "How should a man be just with God?"

Over against man's guilt and helplessness, in the presence of God's all-exacting holiness, is set in the Gospel the atonement wrought out by Christ — an all-sufficient and infinitely gracious provision for all the requirements of the case, made with the clearest and most complete recognition of the righteousness and immutability of the law that condemns, the fearfulness of its curse, and man's utter inability to escape its doom. It was this, the hour of man's extremity, that became God's gracious opportunity. "For when we were yet without strength, in due time Christ died for the ungodly." By this divine interposition in man's behalf, with all of its stupendous displays of "righteousness and peace," love and penalty, the way is prepared by which the infinitely just and holy One may, in full consistency with all the essential attributes of his person, justify ruined, but repentant and believing, sinners.

The atonement of Christ comes to us as a divine decree, proceeding from the counsels of the ineffable Trinity, dictated by mercy, without any co-operation or procuring on our part except as our helplessness and misery drew the divine compassion towards us. It was all of grace, and it was doubly *free* — not elicited on God's part, and in no degree won or purchased on ours. But it comes to us in the preaching of the Gospel as a *provision*, rather than as a completed work of saving. Of itself, considered alone and without subsequent acts of grace, Christ's death saved nobody; that further work of practical saving pertains to the Holy Ghost, and it is effectuated only in personal religious experience. But though Christ's death, *ipso facto*, does not accomplish personal salvation, it provides the way whereby all may be saved. It is the price of redemption, ordained in the covenant of mercy, and accepted in advance, so that whosoever shall enter into its provisions may find life. How it may so become effective is precisely the subject of our present inquiry.

We are now, however, to speak only of the cases of such as have heard of Christ and his salvation, who have been enlightened by the Word of God, have tasted (involuntarily, perhaps, and only to very limited extent) of the heavenly gift, and have been made the subjects of the gracious influences of the divine Spirit. Such is, indeed, the condition of all who live in the diffused light of the Gospel, as found in our Christianized communities, — for wherever the Gospel is preached there also are felt the effectual workings of the Holy Ghost. Of those who never hear of Christ and his Gospel we have not now to speak, and we gladly, and without dogmatizings or speculations, leave them in the hands of a merciful Father, who will judge them, as all others, in righteousness. Nor have we anything to say in respect to those who die in tender infancy, further than to accept the Savior's gracious assurance that they are included in his great

kingdom, and so leaving them in his hands who is as able to save them by methods suited to their conditions, as he is to adapt the operations of his grace to the conditions and wants of adult humanity.

Passing from the Godward side of the great problem of man's salvation, we have next to consider it as an affair of personal experience and action. We take the case of one who is living in the diffused light of Christianity, in the presence of the witnessing Church and in reach of the preaching of the Gospel, who has learned intellectually the great foundation truths of religion, but has hitherto failed to enter into the provision of the Gospel. At length, however, he is awakened to a sense of his true condition, sees himself to be a lost sinner, and begins to ask, "What must I do to be saved?" To that inquiry the Gospel has its ready and all-sufficient answer, which applies with equal and entire fitness to every one — "Believe in the Lord Jesus Christ, and thou shalt be saved." These words would probably in most cases fail of any intelligible meaning, and would, therefore, be without practical results; and should the inquirer seek for instruction from those who have assumed to be teachers of religion, though all might use the apostolical formula in their prescriptions, yet there would be very different notions underlying the common phraseology so employed.

There are in the nominally Christian world three several and different ways propounded by which men may be saved. These are, severally, by *culture*, by *the sacraments*, and by *faith;* and within these three categories may be comprehended all forms of religious opinions and practices that are denominated Christian. These may be considered in their order, though it must be observed that each one holds to some of the things that are distinctive of each of the others.

They who teach salvation by *culture* assume for man in his present estate a less desperate condition through sin than do both of the others, and they also make less account of the inexorable righteousness of the divine law and administration. They accordingly find comparatively little need of divine interposition in order to man's salvation, whether of an atoning sacrifice or of a quickening and sanctifying Spirit, and their estimate of sin, its turpitude and ill-desert, is less grave, and the notion of punishment for sin is relatively faint and indistinct. The divine *fatherhood* is about all that is contemplated in the Almighty, as to his relations to his creatures, and even of that the magisterial and rectoral element is but little considered. As there is no need of a mediator between God and man, there is no call for a divine Redeemer; and since men's natural power and goodness are sufficient, under favorable conditions, for their spiritual elevation, there is no such work needed as is contemplated in the notion of the office of the Holy Ghost. Thus the theory of salvation by culture is necessarily an integral part of a broader theory of naturalism, which, while it is called by the name of Christianity and adopts its terminology and forms of speech, is really and essentially another system.

Should the awakened sinner come to a teacher of this system with his momentous and almost despairing inquiry respecting his soul's welfare, the answer would probably be, first of all, that "you are unnecessarily distressed about this matter. If, however, you are sensible that your past life has not been as it should have been, then you have only to reform it, and it will be well to make that reformation thorough. Begin at once a new course of living, and by persistent efforts school yourself into right habits, so making for yourself a *new heart*. Be thoughtful and devout, and in all things conform your outward and inward life to the best patterns of righteousness, and especially that of Jesus Christ. In that way you will be able to withstand and at length subdue any evil propensities that you may find in your imperfect and undisciplined nature, and so developing the better elements of your character, you will become a *new creature;* and then you may safely trust your case in the hands of our kind Heavenly Father, who, knowing our weakness, will accept our imperfect but well-designed service." In all this, it will be seen, there is very little of Christ and nothing of his cross, and almost nothing of the Holy Ghost. Nothing is heard of the thunderings of Sinai, nor of the divine wrath against sin. No account is made of personal guilt, and the enslaving power of sin in the soul is entirely ignored. This is surely "daubing with untempered mortar" and "healing the hurt of the daughter of my people slightly."

They who teach the way of salvation by the use of the sacraments also say to the awakened sinner, "Believe in Christ" and you shall be saved. Their method for obtaining justification before God proceeds also upon a much more correct and adequate notion of the fearfulness of the condemnation of the sinner and of his helplessness, than the preceding one, as well as of the awful sanctity and authority of the law that condemns him. Indeed, those who teach this way often treat the whole affair as something of the most sacred dignity and the highest possible importance. They recognize the fearful truth of man's utter ruin through sin, his condemnation and his helplessness; they believe in Christ as the Lamb of God,—Christ crucified, the sinner's only hope with God; and therefore they propose to bring the awakened and penitent one to Christ, that his sins may be washed away, and that he may receive the spirit of adoption. But instead of doing this directly,—coming in the prayer of faith to the mercy-seat,—they interpose the Church, with its ordinances and ministrations, and direct him to seek Christ's grace *in* and *through* these. They talk of a new life given and received in baptism, which must be fed and nurtured at the altar of the eucharist,—of abiding in the Church, the house of the Lord, and attending upon its ministrations, so that the soul may grow up into Christ, and become in all things assimilated to the divine likeness, and so made meet for eternal life.

But for this way of salvation by priestly and ecclesiastical offices no warrant is given in the Bible, which, indeed, points out quite another way. It changes the sacraments into charms operating in some unknown way to effectuate certain great and saving changes in the spiritual nature — the washing away of sin and the up-building of the soul in righteousness. The salvation so effected, is, of course, a *legal* one; the sinner is first made intrinsically righteous by a process of priestly services and with an infused holiness, of which God takes knowledge, and approves its subject as a righteous person. This, surely, is not the justification of which St. Paul discourses, which comes by faith, and is not "by the deeds of the law." The Gospel, indeed, contemplates and provides for the sanctification of all its subjects; yet it provides justification for the *ungodly*, and sanctification for all such, and only such, as "believe unto salvation."

They who teach the way of salvation by faith, in directing the penitent sinner to faith in Christ, comprehend in the language employed a richness and fullness of meaning that are not found in either of the others. They at once emphasize the greatness of the promised salvation, and the all-sufficiency of the proposed remedy, where nothing else could avail. Their theory of salvation confesses the reality and the greatness of the sinner's guilt, and both the certainty and the fearfulness of God's judgments against all unrighteousness. It allows no merit in the guilty one, and confesses his utter inability to make himself any better. And for the sinner himself, the most thorough and pungent conviction of these things, in respect to himself, is the best possible preparation for the reception of the proffered grace. A clear and lively religious consciousness, apprehending the reality and the depth of the sin of the soul, is itself the result of the beginnings of that faith which, in its fuller growth, brings the soul to the grace of salvation. It apprehends the reality and the vileness of sin, shows its danger, and so excites fear and urges the soul to make haste to escape. But how shall the guilty and the helpless evade the just judgments of eternal righteousness? All attempts at a legal justification are clearly seen to be unavailing, on account of his accumulated guilt and his helpless enslavement in sin. Here is seen the necessity for an atoning sacrifice of priceless worth, and a divine Mediator. All else would be worthless and unavailing, and in absolute self-abandonment the soul turns only to God, the righteous, the justly offended, yet through Christ the merciful and saving One, not for legal approval, but for gracious forgiveness. And because all men are found in the common condemnation,— for that "all have sinned and come short of the glory of God,"—the grace of salvation comes to all on the same conditions of *free, sovereign grace*. Nicodemus the ruler and Zaccheus the publican, the penitent thief, and Saul of Tarsus, cultured moralists and polished men of the world, with the profane and profligate, all alike are by nature and by practice sinners before God, and have need of the same methods of salvation. Christ receives only sinners. He came not to call the

righteous, but sinners to repentance; and only as men are found in the category of sinners have they the characteristics that call for his redemption.

The pardon of the sinner and his justification must not be effected in opposition to the punitive demands of violated law. Nothing of that kind is anywhere intimated in the Scriptures, but rather the opposite is steadily assumed or implied. Nor can we conceive how it could be possible that infinite truth and righteousness should, without just compensation, grant immunity to transgressors. We accordingly find the fullest and most emphatic declarations that our justification before God is by the merits of Christ's death *for us*, and in answer to his priestly advocacy in our behalf. By divine appointment the sins of the world were laid on Christ, and bearing them upon the cross, he purchased salvation for all men. "By his stripes we are healed." Law, as applied to moral agents, uniformly presents alternative methods for asserting its claims: first, it calls for obedience, which, however, may be refused; next, it demands penalty, and will not be denied. The first alternative being lost to our race, there remained only the second, which, however, God in infinite kindness permitted to fall upon his beloved Son, whom he gave to the world to become the Redeemer of all men, through the suffering of death in their stead — "the just for the unjust, that he might bring us to God." Our justification is, therefore, the *free pardon of all our sins* — or, more precisely, of *ourselves* — as guilty through inward and outward sins before God, the righteous judge of all men, in honor of Christ's sacrifice for us.

Seeing, then, that while, on the one part, man is in himself wholly without the possibility of being saved, and, on the other hand, that our Lord Christ has, by his death, provided a way of escape for us, it only remains to inquire how that provision may become actually available for us. It is very clearly shown that the realization of that salvation in any soul is dependent on certain conditions on the part of its subject, and that condition is equally clearly declared to be *our faith*. This alone and infallibly distinguishes the saved from the unsaved: "He that believeth on the Son hath everlasting life; and he that believeth not the Son shall not see life." Faith, then, whatever that may be, is the only and always required condition on our part of our justification with God, and therefore it is designated *justification by faith*. Not, however, that faith is either the meritorious or the efficient cause of the work, but simply the divinely appointed condition of our acceptance.

Having thus determined, by the plain teachings of the New Testament, that faith is the one indispensable condition of acceptance with God and the only way of access into the grace of his salvation, it becomes necessary to inquire into its nature and modes of action. Is it a merely intellectual state of mind,—a conviction of a certain truth,— or does it also pertain to the moral nature, and to the will? Is it simply passively perceptive and receptive, or also active and dynamical? Is it a function and exercise of the natural mind, or a gracious gift? The proper answers to these questions will present just and necessary conceptions in respect to the *faith* by which awakened and penitent sinners may "be just with God," and will also help to a better understanding of the nature of "the righteousness which is by faith."

Faith, as a form of belief, must be primarily predicated of the understanding; it a conviction based upon evidence, and it thus falls within the sphere of the logical faculties. No doubt, too, simply by the proper presentation of the outward evidences of Christianity the natural understanding may be satisfied of the truth of the things declared; and this kind of belief of the Gospel — a merely philosophical credence — is the commonly prevalent faith of Christendom, and though it is evidently not entirely powerless as to men's characters and conduct, yet as it only remotely and at second-hand affects the moral natures of men, it fails to renew and transform the soul. More than this is necessary for the faith which leads to "righteousness."

In estimating the character and offices of faith, we have, first of all, to notice its perceptive character. It is in view of this office that it is represented as "the evidence of things not seen"—a faculty and mode of perception additional to and distinct from those of sense and reason. "It implies," says Wesley, "both a supernatural *evidence* of God and of the things of God, . . . and a supernatural

sight or perception of those things." It is therefore to be considered as especially and eminently a spiritually quickened and illuminated state of the soul, by which one becomes cognizant of the spiritual realities among which the man subsists, which as a subjective power to see the truth is a divine gift, while the truths so revealed are also presented to the interior vision by the ministration of the Holy Ghost. And yet, in all this proceeding, the receptive subject of spiritual illumination and conviction of the truth is not entirely inactive. His will becomes a co-operating agency from the beginning and in all the processes of grace by which the soul is brought to Christ. If there is found from the first a perverse preferring of darkness rather than light, a willful shutting of the eyes of the soul and a hardening of the heart against the overtures of grace, the progress of the Spirit-work will be stayed and the growth of faith hindered. A docile and willing spirit of mind, a readiness to be taught and a willingness to believe and obey, are among the conditions requisite to the incoming of saving faith. And in the more advanced stages of faith there must be more than simply a yielding to the Spirit's forces. The will, too, must itself become a co-operating force and agency in the work, laying strong hold upon the things offered in the Gospel, with a conscious purpose and active appropriation of the grace of salvation procured by the merits of Christ's death and brought near by the Holy Ghost, who first reveals the things of God and then persuades the soul to accept them, and, last of all, strengthens and directs the hand of faith when it is reached out to grasp them. In all this there is nothing of positive human merit. The light of the Spirit comes unasked; to receive it is right, but scarcely a virtue; to refuse were sin. The light of faith is not the product of the mind's own actions, though it may be extinguished by its perverse resistance; and yet its perceptions are subjective, and the acceptance of salvation is man's own act, God the Spirit still working in him "to will and to do." As to its source and efficiency, faith is all of God; its exercise, however, is man's work, *through grace.*

The gracious state into which the believing soul is thus brought — called by St. Paul *δικαιοσύνη* — is especially worthy of devout consideration. It is often spoken of simply as a new relation of the soul to God and the divine judgments, as if the whole affair were simply and exclusively a forensic procedure. All that, no doubt, it is; and the process is properly illustrated in some of its most important conditions by the legal and forensic figures and arguments used by St. Paul. But this imagery is overstrained when the whole affair is removed away from the subject himself, and made simply an act of the divine mind in each individual case of the justification of a sinner, It is rather the changed condition of the subject, his coming into the light and his taking hold upon offered grace, that accomplishes the change of his relations to God. Its accomplishment in the soul's salvation in Christ implies also an inward advance in spiritual life and the overcoming of somewhat of the power of sin in the soul, so that the process of spiritual renewal proceeds side by side with the processes of illumination, by which faith is enabled to see God and Christ and the way of eternal life.

Nor is this work of grace only for the hour and moment of the soul's conversion to God; it is rather a continuous and perpetual work of grace. The faith that saves at the first is identical with that by which the believer lives and walks with God to the end of his pilgrimage. By this he has access to the mercy-seat, appropriates Christ and his salvation, walks in the light, and goes onward to perfection. And yet at every stage the relation of the justified soul to God is one of absolutely complete acceptance. The angels that never knew sin, and the spirits of just men made perfect in heaven, are no more acceptable to God than is the newly returning penitent who now, for the first time, comes to the Father, through Christ, for pardon and eternal life. Nor does the most advanced child of grace, at any stage of possible experience, get beyond the same condition of salvation by faith alone. The same prayer is still the only appropriate language of the soul,— the same faith in Christ, and in the Father through him,— the same unremitted, ever-renewed *pardons* in the blood of the everlasting covenant, are at once the needs and the gracious privileges of the renewed and sanctified who abide in full view of the Cross, and in the fullest reliance upon its power to save.

FOREIGN AFFAIRS.

WHAT CAN THE RUSSIANS DO?—Just now the political horizon of Europe is a trifle overlaid with war clouds. It does n't look as if it would really amount to any thing, and may prove, after all, mere smoke. But then so we thought in 1869, and yet a decade ago ushered in a great period of terrible warfare, and established firmly Prussian supremacy at the expense of the French. The Russians have been making some headway in Southern Europe and Asia; they are inflated with the enthusiasm of victory; they feel themselves hampered in the East by the English; they are limited in the South by Austrian jealousy; they are watched in the West by German distrust. Greatness, the Russians are beginning to realize, has its perils, success its dangers. We are reminded of the immortal words of wisdom Young wrote in his "Love of Fame:" "High stations *tumults*, but not bliss, create." There have been tumults in Russia for some time; and now there may be more of them for her outside of her own borders. Her next-door neighbor on the west has longingly glanced more than once on those German provinces which lie beyond the Wernd, and constitute one of the grandest of Russian possessions. Many a drop of water may flow into the Weichsel before it shall be crossed by Prussian soldiers to invade Russian Poland, and it will be some time before the sound will die out of those memorable words Czar Alexander recently spoke to his imperial uncle: "Thank the Lord, between us it will not come to war!" But then such occurrences as the reported conflict between Prussian and Russian officers at a dinner in Kalisch, however positively denied by officials, has too much basis in the real feeling of the two nationalities not to be an index of what must come sooner or later. The war party, headed by Miljutin, the minister of war, has too much predominance in Russian politics; Bismarck and Gortschakoff are too wholly estranged, the Russian press is too sorely provoked by the Austro-German alliance not to give fears for the future peace of Europe. As the war was precipitated upon Turkey in 1876, as the Imperialists drove France to mortal combat with King William in 1870, so the Miljutinists may succeed in 1880 in widening the breach already made between nephew and uncle until these themselves shall believe probable what only a short time ago they pronounced impossible.

THE RUSSIAN SOLDIERY.—Very timely comes the appearance of Lieutenant Greene's work on the "Russian Army in Turkey." The lieutenant belongs to our own army, and was dispatched as an observer to the battle-fields in Turkey. He had excellent opportunities to judge of the Russian soldiery, and what he says is certainly of great interest just at this time when another war is threatening to engage these same forces. We believe our readers will thank us for the following summary:

"The great and pre-eminent cause of the success accomplished lay in the most boundless patience and endurance of the Russian soldier. From the time the movement was well under way the men never saw their knapsacks, which remained north of the Balkans, till some time after the armistice. They marched and fought and slept in snow and ice, and forded rivers with the thermometer at zero. They had no blankets, and the frozen ground precluded all idea of tents; the half worn-out shelter tents which the men had used during the Summer were now cut up to tie around their boots, which were approaching dissolution; and, although an effort was made to shelter the men in the huts in the villages, yet always at least half of them had to sleep out in the open air, without shelter. Their clothing at night was the same as in the day, and it differed from that of the Summer only in the addition of an overcoat, woolen jacket, and a bashlik, or woolen muffler, for the head. Their food was a pound of hard bread and a pound and a half of tough, stringy beef, driven along the road; they were forced to carry six, and even eight, days' rations on their backs, in addition to an extra supply of cartridges in their pockets; there was more than one instance where the men fought, and fought well, not only without breakfast, but without tasting food in twenty-four hours. Yet there was not a single case of insubordination; the men were usually in

good spirits, and the number of stragglers on the march was far less than during the heat of the preceding Summer."

SCOTCH UNIVERSITY STUDENTS.—A writer in the London *All the Year Round* has recently given a very interesting sketch on this subject. Our readers are, of course, aware that Scotland is not very rich in universities, but that the four it has take rank with Continental European universities. The oldest of these, St. Andrews, dates back to 1410; Glasgow is only forty years younger; Aberdeen started in 1494; and Edinburgh a little more than a half-century later, namely, in 1552. The students do not live in the college halls as they do in England and in our country. A very considerable proportion of the students are the sons of residents of the town. Living in families where thrift is considered nearer godliness than is cleanliness, they are never able, even if they be willing, to indulge in any extravagances. The students who come from distant shires are as little able to do so. They are sent forth supplied with just as much money as, spun out with parsimony, will keep body and soul together till the end of the term. Often it is not enough without the help of one of the numerous small bursaries established for the cultivation of learning on a little oatmeal. Legends float down from generation to generation of a student who came on foot—and barefoot, to save his only pair of boots—from Skye, or even farther, to the foundation of Archbishop Kennedy. A very small knapsack contained all his wardrobe, and, according to popular belief, he lived through the term on a very hard cheese, brought from home in a canvas bag. The more skeptical insist that there must have been some porridge added; but they find it hard to explain how, for it stands on record that his money barely sufficed for the payment of his lodgings. A very small sum would do. Even now, when a man can, and for some time must, live out of college, an English university student would recoil from the den where the poorer of the Scotchmen read, sleep, and, at least occasionally, eat.

FOREIGN RIVALRIES.—"It is strange, indeed," cries a London exchange, "that the United Kingdom should still import so much timber as it does. The quantity of native produce has, perhaps, not varied greatly during the last fifteen or twenty years, but the importations of hewn, sawn, and split wood had steadily risen from about 3,630,000 loads, valued at £11,528,000, in 1862, to about 6,670,000 loads, valued at £19,040,000, in 1877. This increase, of course, is largely due to the recent growth of our ship-building trade, in spite of the great fluctuations it has lately undergone, and the vast changes wrought by the use of steam and iron, which might be thought injurious to the older trade in more entirely wooden ships. The number of our sailing vessels had certainly been reduced from 26,339, in 1863, to 21,169, in 1877, and their aggregate tonnage from 4,731,217 to 4,260,699; but during the same period the number of steam vessels had increased from 2,298, to 4,564, and their tonnage from 596,856 to 2,139,170, showing altogether a gain in carrying powers of twenty per cent during the fifteen years. We now construct fewer vessels in a year than formerly, either for our own merchants or for foreign customers, but those we turn out are of much larger aggregate bulk, and, notwithstanding a few murmurs to the contrary, there is small risk of 'British-built' ships losing their superiority over all others. Whether we shall maintain our character for excellence in other sorts of wood-work may be doubted. English carpenters used to be famous for the deftness and thoroughness of their work, but it must be admitted that, in common with the other building trades, they have lately done much to prejudice themselves, and it is not satisfactory to know that from the United States every year there now come, even into England, great cargoes of window-sashes, doors, skirting-boards, panel-work, wainscots, and all kinds of joinery, which, as wood is there much cheaper, and labor no dearer, can be sold at a profit over the heads of our own workmen. The Americans are also sending furniture to us instead of coming to us for it, as the cheap and comfortable 'American chairs,' now to be found in nearly every house, testify. The value of the household furniture exported from the United States in the year ending June, 1878, a large quantity of which was disposed of in England, was nearly £400,000, or £50,000 more than in the previous year. Our own exports, under that head, including the large item of 'upholstery wares,' with which wood-work has little to do, amounted to only about £380,000,

and was below the average of the past five years."

ROMANISM IN CHINA.—It is now two hundred years old. In its early days the progress Romanists made in various guises was altogether marvelous. But soon the Chinese found out what was the real purport of these European missionaries, and Christianity became a byname and a reproach among the "Heathen Chinee." Since the French treaty of 1860 Romanists have had a new chance. Great properties which had been confiscated were then restored to them, and now they have secured a position in nearly all the provincial capitals of the empire. In many places the missions support themselves, while other missions have very large revenues, and are able to support the weaker ones. The Catholic strength is greatest in the province of Sruel nan, where entire districts are filled with their villages, and the cross is seen on the flags of junks in the great ports. It is this superior advantage which Protestant missions have had to contend with in China. During the late famine incidental results of the relief measures have been the occupation by English Baptists of the province of Shansi, and the granting to a missionary physician of full liberty to preach the Gospel to every patient.

TURKISH MANNERS.—Mrs. Stevenson, in her recent work entitled "Our Home in Cyprus," writes: "He who sat opposite to me, after helping me to some chicken broth, highly flavored with oil and cinnamon, suddenly helped himself to a few spoonfuls, which he ate with a great deal of noise and lip-smacking, and then as suddenly proceeded to fill my plate with the same spoon. I was quite aghast. . . . It was the same thing throughout the dinner. Though we had plates, spoons, and table necessaries, he had but a wooden ladle for himself, and he not only helped us with this, but used it for his own eating, putting it back into the dishes at every mouthful. The chicken he divided with his fingers, sucking them well afterward, and, finally seizing my husband's tumbler, drank it off, called for more water, filled it up again, and gravely handed it back to him. . . . But, in truth, even the educated Turks have not the least delicacy in eating, unacquainted with the usages of good society; they can not understand our objections to their manners."

BELGIUM SCHOOL LAWS EFFECTIVE, AFTER ALL.—The Catholics claim that they have established 3,000 schools in Belgium in four months, and that 2,500 teachers in the public-schools have resigned. But the Belgian prime minister states that out of 4,376 Catholic schools, 168 were deserted when the new law went into effect, and 578 out of the 1,135 students of the Catholic normal schools have deserted to the government schools. Whom shall we believe? The great Italian poet Tasso somewhere sings of "a noble lie." Romanists know what this means by actual practice.

ART.

THE STATE CAPITOL AT ALBANY, N. Y.

FEW buildings of this country have been the subject of more debate in public bodies and of more virulent criticism in art journals than the State Capitol at Albany, New York. As, in case of so many public contracts, here and elsewhere, the original estimates have been entirely ignored by the various parties and superintendents having control, and the result will be a building the most costly and extravagant within the territory of the United States. Already nearly eleven millions of dollars have been expended, and it is computed that nearly five millions more will be required to bring the present modified plan to completion. It will be readily conceded that this is a sum of money for which an intelligent commonwealth should realize some grand and satisfying result, one of which it might well feel proud, and one which would stand as a means of educating its citizens in the noble principles of a pure and correct architecture. From the frequent and adverse criticism of the architects and of writers on the principles of design and decoration, we must infer that the final results are to be very disappointing. The first grand cause of

this is undue haste in the preparatory studies. The committees or commissions which are appointed on these great public works seem to have no adequate or clear conception of what is needed. That larger, more commodious, and better ventilated chambers for the sessions of the legislature, for the departments of the government, and for the courts were needed was confessed by all. But even the bare needs of the government with respect to the number, the size, the form, the style, and the relation of rooms seemed not to be comprehended. Hence the architects presenting competing plans were not in full possession of what is most essential, namely, the space to be inclosed. The time allotted for the preparation of the plans was entirely inadequate. A building so large and costly demands years of careful study in order to the complete mastery of outline and detail. The questions which connect with the department of architectural engineering are many and vital. The strength and durability of materials are primary considerations. Herein the English architects made their first great mistake in connection with the new Parliament House, London. The beauty of the structure is already marred by the decay of the stone in some of the most elaborately finished parts. Next the unity of the work compels most protracted and patient study. It is not only because we have no architects who are sufficiently educated in the arts of design, that many of our public buildings present so strange a conglomeration of elements, but it is also owing to the undue haste which the conditions of building commissions compel. The next fatal blunder made in this and other cases, is the niggardly meanness of the sums allowed to the architects for their competing designs. No man of first-class ability can possibly afford to give the requisite labor to the designs of which a building so immensely costly is worthy, when the compensation is so meager. What is the result of this "penny-wise" policy? Necessary alterations and modifications which have cost the State a thousand times more than would have secured the most patient, scholarly, and complete elaboration of a plan after which a structure could have been erected, as Solomon's temple, without the noise of ax or hammer. It is impossible to know exactly how much money has been ruthlessly squandered through the carelessness, the rascality, or the ignorance of the various parties connected with this "job;" but it is certain that enough has been wasted to secure, under an honest, faithful, and intelligent commission, an architectural monument which would have attracted to it unknown thousands of visitors. It seems very likely that to all the other blunders there is to be added that of most imperfect and inappropriate decoration. Here, we fear, is to be repeated, for the fiftieth time in this country, that senseless and meaningless decoration which has always seemed so tame to thoughtful Europeans who have visited our land. Few buildings of the United States have presented so rich and varied opportunities for significant decoration as the Albany capitol. Yet, with the single exception of Mr. Hunt's work, scarcely one worthy result has been reached. What splendid surfaces were there presented for telling the history of the Empire State in rich pictorial language which would have been a joy to every visitor! What an encouraging patronage to American artists had a tithe of the squandered or stolen money been used to enrich this building with the best products of their genius! The thoughtful citizen sometimes becomes heart-sick while he ponders these things, and he is prone to inquire whether art patronage and art encouragement are possible under a government whose policies and politics are like our own.

MOZART'S PLACE IN ART.

A WRITER in the *Edinburgh Review* concludes an appreciative notice of the recently published works of Mozart, and the later lives of this great musician in the following words: "Life is many-sided, but imperfect, and a perfectly balanced art is apt to fall short in the intensity of expression which the representation of the most poignant and passionate moments of human emotion demands. We do not say that Mozart never realized the highest intensity of emotion; there are moments when he reaches it, but they are, comparatively speaking, few. We hear his *andante* from the Symphony in C, and we wear a face of the most calm and perfect beauty; we hear the *allegretto*, of Beethoven's Seventh Symphony, and we are conscious of a passionate cry from the depths of the human heart, and if we compare them in their gayer moods, the *finale* of Beethoven's Eighth Symphony is to that of Mozart's in E flat as a

bacchanalian orgy compared with a gay and merry *fête champêtre*. Mozart is the more perfect artist, but Beethoven is the more intense and passionate poet, and human nature has answered to his call. But even admitting this limitation in Mozart's power of emotional expression, we must make two very large allowances in regard to him. If we remember how many of his works were produced under very disadvantageous circumstances, and hampered by the imperfect capacities of his executants, and if we consider what is said of the effect of his *extempore* playing, we may well imagine that if we could have had crystallized for us what Mozart played on the organ and pianoforte when pleasing only himself and listeners of the highest order, we might find that he came closer to Beethoven on the piano-forte, and was more near surpassing Bach on the organ than his engraved music gives us any adequate idea of; and if, secondly, we take into account the fact of his early death, that he had been all his life harassed and in difficulty, and if we bear in mind that he was steadily rising in his art up to his last moment, and that the portions of his last work which he completed are the highest and most serious in spirit of all that he ever wrote, we may be disposed to think that, could he have had the twenty years more of life which were allotted to Beethoven, with the competency and freedom from care which had been insured to him, unhappily just too late, he might, very possibly, have earned the name not only of the most perfect, but the greatest of musical composers.

STATUARY MARBLE.

THE demands of our civilization are terribly exacting. Yet it is plain that the resources of nature are exhausted rather through sheer extravagance and waste than by the gratification of rational wants. Already must our young government appoint a "Commissioner of Forestry," to supervise the preservation and restoration of trees in place of the grand native forests which have been so ruthlessly swept away. So with regard to anthracite coal-beds. Supplies which once seemed inexhaustible now threaten to fail within a period quite easily computable—thus causing anxious inquiries as to the fortune of certain industries which are now so important. Now the artists, too, are becoming alarmed with reference to the supply of marble for the finer and more excellent of their statuary. It is well known that the Pentelican marble of Greece became renowned in the ancient world for its grand superiority and adaptation to represent the works of the most eminent Greek sculptors. It would seem that the same wasteful and thoughtless methods were practiced by the quarrymen of twenty-five hundred years ago in these Greek quarries as are witnessed to-day in the only quarries which have ever been their successful rivals. We refer, of course, to those of Carrara, in Italy. The French Geological Survey, which has been conducted by M. Albert Gaudey, claims that the plain of Pentelicus still rests on a base of marble as rich as that which passed into the structure of the Temple of Theseus, or adorned the frieze of the Parthenon. Surely this will prove most excellent news to the artists, if further explorations shall verify this report. For years occasional complaints have been made by the sculptors who were working in Italy over the difficulty of obtaining suitable blocks of marble at any thing like reasonable rates. The *Building News* reports that, while at Carrara more method is observed in the devouring process, it is none the less exhausting. A little community of sculptors is established around the quarries; the work of the artist's chisel goes on within a few yards of the marble-mason's saw; statues, bas-reliefs, capitals, and columns are perpetually being turned forth at a rate which unquestionably threatens that the supply will be of no very protracted duration. A late traveler was assured on the spot that hundreds of tons annually were heedlessly thrown away in needless chipping and superfluous dust. Besides this, valuable blocks are every now and then ruined by the clumsiness of the workmen, or, at any rate, have been cut up into smaller, and, therefore, less valuable fragments, so that a supply which might last indefinitely is recklessly consumed without the remotest reference to the future, and only in the prospect of immediate gain. Marvelous, however, must have been the wealth of this narrow region in one particular material, when it is considered that this war, so to speak, upon the rock has been going on, almost without intermission, since the days of the Roman Empire, though that there was a gap, historians are agreed, and the neighboring ruins attest.

Yet, when it is remembered that Canova the Venetian, and Thorwaldsen the Dane received their artistic education within sight of these quarries, a greater wonder is that they are not more sedulously cared for, or, in a sense, preserved. But the material whence the Venus of Milo, and that of Medici, the Antinous, the Bacchus, and the Mercury, which have been the delight of ages, were fashioned is now actually sold by the hundred weight and ton, as though it were no more precious than is the mock alabaster of Volterra. One deplorable circumstance is that so much of it is removed in colossal masses, for the decoration of commonplace, albeit gorgeous, edifices of the nineteenth century, with the result that what might have furnished the principal splendor of a gallery at Rome or Florence may serve as the pavement of a vulgar vestibule, or the coping-stone of a wall.

Not a few of the rocks quarried out, it should be remarked, have already ceased to yield the material for statuary, while, although the huge calcareous masses rising in every direction around appear to promise an unbounded store for the future, it is well known that they may be pierced far and wide—a certain vandal once suggested blasting—without a bed of the pure, veinless, almost imperishable sculptor's marble being found. About two hundred and fifty dollars a cubic yard is considered an average price, apart from the cost of quarrying and transport; but it is not surprising that the tariff rises from year to year. It may be a long time, of course, before the world is compelled to put up with the French invention of "artificial marble," which is no more than a species of stucco; but it is much more to the point to know that the merchant princes of Holland, a country almost destitute of stone, and wholly destitute of marble, frequently adorn their mansions, under the direction of French architects, with stairs and balustrades of Carrara marble, and that at Berlin, Vienna, and Munich, a similar prodigality is not rarely to be met with. At this very day the sultan of Turkey and the viceroy of Egypt transmit orders to the same quarries, for the decoration of palaces which they never inhabit, not jewel-worked specimens, merely, but lofty pillars and balustrades for spacious galleries. The ancients decreed at one time, when their art genius was at the highest, that neither Carrara nor Pentelicus should be quarried except by architects of temples; but now the market is for all the world. The Italian Government, it is true, did once hint at a protectorate over these treasures; but nothing more has been heard from the measure. Meanwhile, the Italians profess to be alarmed lest America, which demands large supplies for monumental and artistic purposes, should compel them to work out their incomparable quarries.

ENGRAVINGS FROM BIERSTADT'S PAINTINGS.

It is often found to be impossible to transfer into an engraving, though the largest practicable, the effect of some grand landscape painting, since size, as well as other qualities, is a condition essential to impressiveness, and yet we see this accomplished in one of Bierstadt's great mountain landscapes—the Indian "Encampment," engraved by Smilie. That picture most successfully combines and harmonizes the gentleness of a Summer evening in a mountain valley with the quiet encampments of the Indians, after a successful hunting, resting quietly without any fear of an enemy, with the boldest mountain scenery in the background, lofty peaks, naked hill-sides, and long sweeps of deep gorges, altogether making a picture of unequaled boldness and beauty. It is no exaggeration to speak of Bierstadt as *the* landscape painter of America, for to that specialty he seems to have devoted all his genius; and with so grand an unharvested field from which to gather his materials, he has brought together, and largely wrought into forms, an almost unequaled amount of studies from nature, at once among the finest and the grandest in existence. By birth and descent a German, he came to this country in early childhood, and grew up in a New England city, and so became as really American as his lineage and blood would allow; and though as an artist he is a cosmopolitan, yet even here he reveals his deep and abiding love for the land of his early adoption and education, some of whose scenes he has so successfully and ably spread upon his canvas. The style of all his works is of the highest and grandest, making them truly the classics of the pictorial art, uniting boldness of conception, successful combination of parts, and the most exquisite finish, down to the last details.

NATURE.

THE CAUSE OF WHOOPING-COUGH.—The idea has prevailed, and, in fact, is still prevalent now to a very great extent, that whooping-cough must run its course, or that it has a definite extent; and if the cough is broken up it would be much worse for the child, for it would be laying the foundation for some fearful disease in the child's system. Doctor Mott, whose authority is of the highest order, fully believes that to this popular conclusion can be attributed much of the mortality among children. The deaths from whooping-cough, according to Condie, are 1 to 82 of the entire mortality in Boston, 1 to 46 in Charleston, 1 to 95 in Baltimore, 1 to 63 in Philadelphia, and 1 to 64 in New York. Considering such figures as these surely any effort made to discover the cause of this terrible disease, and to point out the proper line of treatment, will be met with an eager reception. Much diversity of opinion has existed in regard to the pathology of whooping-cough. Fortunately, however, owing to the investigations of Dr. Letzerich, of Germany, in 1871, and the confirmation of his results by Dr. Mott, the knowledge of this disease has been greatly augmented. Letzerich showed, for the first time, that if the expectorated mucus coughed up during the short duration of the first catarrhal-like stage of the disease be examined under the microscope, there will be seen, besides the phlegm, etc., small elliptically-shaped brownish-red fungus spores, some of which have partially germinated and brought into existence mycelium. This discovery gave a clew at once to the cause of pertussis, and opened a new channel for its treatment.

Dr. Mott, having an opportunity of studying the disease in his own children, and after careful microscopical investigations of the phlegm whooped up during the various stages in the development of the disease, is now prepared to confirm, in the main, the conclusions of Letzerich. Dr. Hamilton, who reviewed the work and theory of these two investigators, says: "The only theory which seems to me tenable, and, I think, the success of certain remedies bears it out, is that whooping-cough is the direct result of a fungus growth; that the spores are thrown off by the person coughing, and are conveyed by the air and received by another person in the saliva of the mouth, which retains them until they have time to attach themselves to the under side of the tongue, where the mucous membrane is the thinnest and softest of any part of the mouth. In this situation they remain until they are able to germinate and spread along the sides of the tongue and backward until they reach the larynx and pharynx, when the full whoop is established."

Letzerich made numerous experiments on rabbits with the spores of whooping-cough. The spores were cultivated on pieces of bread soaked in milk, then introduced into the trachea of young rabbits for future development. This was effected by tracheotomy, but the animals rapidly recovered from the effects of the operation, and in a short time became affected with a cough—the same as whooping-cough. The rabbits were killed, and their air passages and lungs were found to contain enormous quantities of fungus; the expectorated mucus was also the same as in man. From Letzerich's valuable investigations he was able to show the difference between the action of fungus in diphtheria and that in whooping-cough. In diphtheria the vegetation of the fungus originates at the head of the windpipe and trachea, seizes and destroys the epithelium with startling rapidity. In whooping-cough the fungus germinates in the epithelium web; at first in the upper part, and then over the whole respiratory organs, without destroying the web, produces the cough and its manifest complications. If the growth of the fungus is confined to the epithelium of the epiglottis, of the larynx, and trachea, then it is simply whooping-cough; but if the fungus enters into the delicate bronchial tubes and the cavities of the lungs, then the dreaded complications arise. It is, therefore, best to meet the disease in its earliest stages, and treat it properly; that is, with an object to kill the fungus, and so prevent further development. What, then, shall be the proper remedy? Quinine has been used for a long time with excellent results, but its use was not founded on the knowledge of the fact that it kills fungus. Dr. Mott adds

his testimony as to the efficacy of this remedy. Having administered it to his own and many other children, he states that they all speedily recovered, not whooping more than once a day after the second day it was given them, and discontinuing to whoop entirely at the end of the fifth or sixth day. He thinks the time of coughing could be much shorter if the children could be induced to take it as a powder directly on their tongues—allowing it to dissolve slowly. The best time for administering it is just after a coughing spell and just before retiring for the night. As regards the size of the dose, this should depend upon the age or severity of the case. To a grown person, from three to five grains of powdered quinine can be put right on the tongue and dissolved. To a child, two to five grains may be dissolved in two ounces of sugar made into a gum by boiling with water, and one tea-spoonful can be given at the times mentioned. Quinine administered in gelatine or sugar-coated pills is of no use whatever.

A Moving Village.—A moving village is causing much alarm to the inhabitants of the department of the Hautes Alpes, Southern France. Gradually, within the last few years, the village of Villard d' Arenne has been slipping down hill. The church, built on solid foundations, has copied the migratory tendency of the houses; the cemetery has followed suit, and a large neighboring hill has now joined the procession. Heavy rains are believed to have undermined the ground, and dikes are being raised to prevent such unseemly conduct, but as yet have not proved of much use.

Micro Organisms.—To the inquirers, Of what service are those swarms of infinitesimal objects which are revealed only through the microscope? do they subserve any other purpose than to amuse the infatuated microscopist? the reply is; that their operations in nature are on a grand and imposing scale, and that their influence on men and other organisms, as well as on the air, water, and solid earth, is nothing less than enormous. Although we do not see these infinitesimal creatures at work, their proceedings are none the less real. It may be shown, 1. That, as *food*, they feed a greater number of beings than any other kind of organisms; 2. That, as *scavengers*, they eat more refuse than any other group of organisms; 3. That, despite their minuteness, their *fossil remains* are much greater in bulk and of far more consequence than those of larger quadrupeds; 4. That, as *builders*, they have produced immense structures, which far surpass in size all the colossal works of man!

Horse-hair versus Eels.—It is a fact, hardly credited by those who have even the slightest scientific knowledge, that the supposition that a horse-hair falling into water ultimately develops into an eel is still popularly held to be true. The animal which, no doubt, occasioned this absurd notion, is a worm, which never was a horse-hair, and never could become an eel, which looks like a vivified wire, and is called the *Gordius aquaticus*. These worms are occasionally found in herbage and puddles. It is also stated that they sometimes inhabit the intestines of some insects, especially the grasshopper.

The Days Growing Longer.—In a recent lecture on "Eclipse Problems," Professor Charles A. Young, of Princeton, said, with reference to the observed increase in the rapidity of the moon's motion, that the discovery led at first to the opinion that the moon's orbit was growing shorter, and that ultimately the moon was coming down upon us. More accurate calculation, however, shows that there is no danger of so disastrous a result. The moon is not coming nearer, but our day is growing longer, owing to the friction of the tides upon the earth's surface. The tides act like a brake, and slowly diminish the speed of the earth's rotation.

Fish Killed by Lightning.—A correspondent of *Land and Water* says: A curious incident of the destruction of all the fish in a pond by a flash of electricity is reported from Seck, Grand Duchy of Nassau. The *Nassauer Bote* states that, during a very heavy thunder and hail storm at night time, a flash of lightning struck a small pond, well stocked with various kinds of fish, the property of the pastor of the parish. The following morning the whole of the fish were discovered dead upon the surface of the water. They had all the appearance of having been half boiled, and crumbled to pieces at the least touch, just as in the case with fish after being boiled. Neither any external nor internal injury could be observed, the scales being intact, and the swimming-

bladder being filled and well preserved. The water in the pond was still muddy and dull the morning after the storm, as if the lightning had only then struck it.

UNINFLAMMABLE FABRICS.—Messrs. Martin and Tessier propose a mixture composed as follows for making uninflammable textile fabrics, paper, stage hangings, etc., namely: Pure sulphate of ammonia eight parts by weight; carbonate of ammonia, two and a half parts; boracic acid, three parts; pure borax, one and seven-tenth parts; starch, two parts; water, one hundred parts. The articles are to be steeped in the boiling mixture till they are thoroughly saturated; then they are dried and pressed.

USES OF PAPER.—A complete list of articles made of paper would be a very curious one, and almost every day it becomes more so, not only in this country, but also in Europe. For example, among the things exhibited at the late Berlin Exposition, were paper buckets, "bronzes," urns, asphalt roofing, water-cans, carpets, shirts, whole suits of clothes, jewelry, materials for garden walks, window-curtains, lanterns, and pocket-handkerchiefs. The most striking of the many objects exhibited in this material was, perhaps, a fire-stove, with a cheerful fire burning in it. We have from time to time noted the announcements of newly invented railway carriages and carriage-wheels, chimney-pots, flour-barrels, cottage-walls, roofing tiles, and bricks and dies for stamping, all made of paper. A material capable of so many uses, so very diversified in character, is obviously destined to play a very important part in our manufacturing future. Articles of this kind, which have just now, perhaps, the greatest interest in this way, are paper "blankets." Attention has frequently been called to the value of ordinary sheets of paper as a substitute for bed-clothes, or, at least, as an addition to bed-clothes. The idea seems to have suggested the fabrication of "blankets" from this cheap material, and if all that is said of them is true, they ought to be extensively used. For the extremely indigent they should be a great boon, and it is in their favor, perhaps, that they can not, of course, be so durable as ordinary woolen or cotton goods. The bedding of many of the poor can not but be productive of much sickness and disease, and a very cheap material that will last only a comparatively short time must be better than durable articles that are rarely, if ever washed.

RELIGIOUS.

ROMANISM IN 1880.—Cardinal Manning and his episcopal colleagues have just issued in London a Roman Catholic directory, from which we glean interesting statistics of the state of that Church. From the lists of the sacred college of cardinals, it appears that there are now six cardinal archbishops, fifty cardinal priests, and twelve cardinal deacons, one of the latter being John Henry Newman. There are only two survivors of the cardinals whom Gregory XVI, the predecessor of Pius IX, created; three vacancies exist, and already in the present pontificate nine cardinals have died. In Great Britain and Ireland, and the colonial dependencies of England, there are 14 archiepiscopal and 77 episcopal sees, besides 34 vicariates (sees held by vicars-apostolic), and 8 episcopal prefectures. Including 11 auxiliary bishops, there are now holding office within the limits of the British Empire 127 bishops and archbishops, with a few retired bishops, of whom four live permanently in England. Of Roman Catholic peers there are 38, being an increase of three; and of Catholic baronets, 48. The number of priests in England, Wales, and Scotland, is 2,211. They serve 1,438 churches and chapels, not including the domestic and private chapels in houses of gentlemen and noblemen.

DR. DEEMS GONE ABROAD.—Apropos Dr. Deems's departure for Europe and the East, an exchange remarks: "It is with great regret we learn that Dr. C. F. Deems has retired from the editorship of *Leslie's Sunday Magazine*. He has held the position for six years, during which he has filled it with great ability, and the success of this deservedly popular serial is

only a fitting tribute to his fitness for the post. For nineteen years he has borne the strain of pastoral and literary labor—more than thirteen of which he has spent in New York City. He now goes abroad for relaxation; and we part from him with much regret, and wish him God speed wherever his path may lie." In this fraternal sentiment every evangelical Christian in this land will, no doubt, cordially unite. Dr. Deems belongs to the Church Catholic, though he is pastor of the "Church of the Strangers." How many such in the great metropolis have been succored and comforted by him the last day only will reveal; by his able writings, his indefatigable labors, he has accomplished much in advancing the best interests of evangelical Christianity.

MISSIONARY SUCCESS IN THE SANDWICH ISLANDS.—From private letters written on board the missionary brig *Morning Star*, which is now in the Sandwich Islands, it is learned that at a revival in Tapatuma, under the charge of a native, fifty or sixty persons have been taken into the Church, and that the congregation numbered two thousand natives. A marked improvement is noticed in the people over last year. They now wish cloth for coats and trousers, instead of knives, which was all they would take from the visitors when the brig was last there. Some trouble has resulted from interference on the part of a Chinaman trader. He gave the natives powder and ball to fight the Christians with, and made a bird which he set up as an idol for them to worship. There were a few fights, but the natives soon gave up the business, and destroyed their idol.

SEMI-CENTENNIAL OF SCOTCH FREE CHURCH MISSIONS.—Although the Free Church of Scotland is only about thirty-six years old, it is celebrating the jubilee of its foreign missions, which were founded fifty years ago by Dr. Duff. The Free Church carried nearly all the foreign missions with it when it separated from the Church of Scotland, in 1843. The semi-centenary of the foreign missions is also the centenary of the birth of Dr. Chalmers, whom Dr. Duff, in 1847, declared to be the "leading missionary spirit of Christendom."

ITINERANT PREACHING INDORSED BY ANGLICANS.—The *Church Advocate*, organ of the Irish Episcopal Church, lamenting the lack of pulpit power of its Church, suggests that the plan of other Churches for making the gifts of the few available for the many might be adopted. Thus, the Methodists, it says, by their periodic changes of stations, and the Roman Catholics, by their preaching orders, have so contrived to circulate and distribute their preaching powers, that even the remotest extremities of the body corporate are brought under its influence.

CHINESE MISSION CONFERENCE.—At the recent session of this conference delegates to the General Conference were elected in due form by ballot, S. L. Baldwin being chosen delegate and N. J. Plumb reserve. The Lay Electoral Conference met in due form, Sia-Kai-Lwang, the venerable father of Sia-Sek-Ong, was chosen president, and Ting-Heng-mi, foreman of the printing-office, secretary. Wong-Sen-Ching was chosen delegate. He was formerly a soldier in the imperial army, but is now carrying on a Christian rice-shop and an anti-opium hospital in the city of Foochow. The reserve delegate is Ling-Sieng-Sen, the book agent at Hing-wha. The conference was a fine body of Methodist laymen. Let no one be anxious about the "great expense" and the "folly" and so forth, of transporting these Chinese delegates to America. They are not going. But our laymen are glad to be recognized as a part of the Church, and chose to elect their delegates, that they might have a *name* in our Israel, and, perhaps, as an intimation that they expect to have their delegates present some day in the General Conference of the Methodist Episcopal Church *in China*.

A NEW METHODIST CHURCH.—An effort to establish a new denomination is in progress in Philadelphia. It is styled "The Methodist Church," the leader of which, Rev. E. W. Kirby, thus describes it: "It is neither a secession nor an offshoot from any Methodist body, though many of its members have been members of the Methodist Episcopal Church, but its system is different. There is but one order in the ministry recognized, that of elder, to which women are eligible equally with men. There are no presiding elders and no bishops, though the president of the annual conference exercises the powers of a superintendent. There are, however, class-meetings, attendance on which is made a test of membership, quar-

terly-meetings, local preachers, exhorters, etc., as in the Methodist Episcopal Church. In plainness, opposition to display, and to fairs, etc., for raising money, the new sect resembles the Free Methodists. It has eleven appointments and nine churches, and claims to be a growing body. The promotion of holiness is a special feature of the meetings."

PROTESTANTS WISER THAN SOLOMON, SAY THE TURKS.—The Rev. Mr. Scott, of the mission of the American Board in Turkey, on his return to his field in Asia Minor from this country, put a small steamer on Lake Van, the first ever seen in that part of the world. The natives watched its motions with astonishment and delight, and expressed the belief that the Protestants were wiser than Solomon.

PRAYER FOR COLLEGES.—The concert of prayer for colleges was first observed in the year 1823. Until within a few years past these seasons of special prayer have been conducted on the last Thursday of February in each year. At the request of several college presidents and other educators, the time of this annual united supplication on behalf of the youth in our schools was changed, about a decade since, to the last Thursday of January. The day is more generally observed than formerly by all the religious denominations, though some of the larger communities of Christians seem inclined to return to the original date of its observance.

PAPAL INFALLIBILITY.—In defense of the Belgian bishops the Archbishop of Mechlin gives the following on papal infallibility: "Infallibility is not what is alleged by the editors of certain papers, the members of certain parliaments, the professors of certain universities, and sometimes, also, by lawyers and soldiers. No, for the pope is not infallible when he expresses only his own ideas; but he is infallible when, as head of the Church, he defines truths contained in the depository of revelation, the Scriptures, and tradition. The pope is not infallible when he judges purely personal questions; but he is so when he judges doctrinal questions affecting faith or morals—that is to say, revealed truth or revealed law, the pope being infallible only when he rests on the testimony of God or revelation. The pope is not infallible when he treats as a private doctor questions even of doctrine; but when he judges by virtue of his apostolic authority that a doctrine affecting revealed truth and revealed law ought to be held by the Universal Church."

THE BIBLE IN JAPANESE.—Superintendent Maclay, of Japan, writes: "You doubtless will be gratified to learn that the committee which has been engaged in translating the New Testament into the Japanese language, has at length completed its labors. A careful revision will now be given to the entire manuscript so as to prepare a clean copy from which to print the standard edition of the work. The work of translation and revision was formally commenced by the committee in 1874, and was completed, as indicated above, December 2, 1879. To those prepared to appreciate the momentous importance of the work on which the committee had been so long engaged, it will not appear strange that to the members of the committee, the completion of the work was an event of great interest. The reading of the last verse of the approved translation by Mr. Matsuyama, our faithful Japanese assistant, was finished at 11.39 A. M., December 2, 1879; after which, at the suggestion of the Rev. D. C. Greene, Dr. J. C. Hepburn, the senior member of the committee, and Mr. Matsuyama led the committee in devout thanksgiving to Almighty God for his distinguishing mercy in having brought the committee to the termination of its labors."

CHRISTIAN INCREASE IN INDIA.—It is shown that, if the rate of increase in the nominal Christian population in India which obtained during the last decade were kept up, and only kept up, during future decades, a majority of the population of India would be nominally Christian before the year 2000. That rate of increase has not only been maintained, but much exceeded, during the decade now in progress. The ratio, hereafter, is likely to be not arithmetical, but geometrical.

TEMPERANCE IN CHINA.—Gospel temperance meetings are held every Sabbath evening in Temperance Hall, Shanghai, China, after this good fashion: They are informal, conducted by a layman, short, interesting, and impressive. The religious meeting is preceded by a cup of tea provided gratuitously for those who attend. For there is no doubt that a man is in a more favorable condition to receive the Gospel when his stomach is comfortable than

when it is crying out for food. The hour of service is about half-past seven o'clock.

Religious Miscellany.—Where are your costly churches now? In Russia, at Moscow, a temple is to be dedicated next August which has been building since 1833, and will cost when completed a little over thirteen million dollars.

—Women do sometimes have a mind of their own. There is a sister in Waterloo, Iowa, Cornelia Nutter is her name, who, finding herself in the possession of abundant means, did not wait, as so many men do, until death had cut her off from the enjoyment of her money, but quietly took thirty thousand dollars out of her money chest, and the other day handed it over to Garrett Biblical Institute, for the endowment of the chair in Practical Theology.

—The Greeks are determined to reinstate the old Hellenic speech. In ordering the reading of the Bible in the public-schools, it was specified that the original and not the modern Greek should be used.

—Dr. Channing, the great American Unitarian, who was more of an orthodox than many who bear that name, is to be honored on his approaching hundredth birthday, April 7th, in this country, by the unveiling of a statue; and, in England, by the publication of one hundred thousand copies of his complete works, to be sold at the nominal price of a shilling each. There never was a greater divine outside of evangelical Christianity who pressed closer to the borders of New Testament Christianity, and who did better work for the Master and humanity. His essays against *slavery* alone will keep immortal the name of William Ellery Channing. Those who wish to know what Channing was should read Dr. Abel Stevens's article in the *Methodist Quarterly Review*, of January, 1849.

CURIOUS AND USEFUL.

Depopulation of the Esquimaux.—A shocking account of the sufferings of the Esquimaux living in the vicinity of Behring's Straits has reached San Francisco with the return of the Californian whalers. It appears that the constant chasing has driven the whales considerably farther north, and the American whalers have in consequence during recent years taken to killing the walrus at the rate of nearly one hundred thousand annually. As the seal is a necessary of life to the Esquimaux in Greenland, so is the walrus to those on the shores of the straits; and the gradual destruction of this animal is causing terrible sufferings among the people. On the shores of the Bay of St. Lawrence nearly one-half of the population has died from starvation, and it is stated that in one village containing two hundred inhabitants every one has succumbed. It is computed that for every one hundred walruses killed one Esquimaux family is starved to death. What seems to be wanted is a regulation to stop the wholesale destruction of the walrus in the same way as the seal is now protected, or the native game in our older States.

Household Dangers.—A member of Parliament suffered from a painful eruption of the feet, traced at last to some fashionable socks, which were laid aside, with the result of ending his complaint. Some Californian miners died from the effects of poisoning produced by wearing boots lined with bright green flannel, the color in this case being "Scheele's green," a well known arsenical compound. A tradesman suffered from wearing a bright maroon flannel shirt. Paper collars glazed and stiffened with sized white lead, and containing arsenic, have produced serious illness; and the same results have followed the wearing of hats lined with material containing arsenic, and from gloves and coat sleeves similarly treated. Five or six persons in a household were rendered suddenly ill by the matter exhaled from chintz window-curtains and bed-drapery, and green Venetian blinds have been known in hot Summer weather to give off particles of arsenic with deleterious effect. The green cloth lining of a perambulator has affected its young occupants, and the color from the green gas shades in a composing-room of a printing-office has produced illness among the compositors. In

the kitchen, arsenic has now and then been met with, when used to impart a green hue to dishes, such as blanc-mange. In one case a gentleman was poisoned by partaking of a dish innocently enough colored by an arsenical preparation which had been mistaken by the cook for an extract of spinach. And even in the exercise of the perfumer's art, it behooves us to be on our guard against using preparations for the hair colored green by some compound of this substance. We thus find that arsenic is most widely diffused around us, from the facility, and above all, from the cheapness with which a beautiful pigment and a favorite hue can be produced through its aid. It is undoubtedly in the form of color in wall-papers that arsenic most frequently meets us. In paper-staining, more than one compound of arsenic is used; and in the manufacture of the beautiful aniline dyes, so extensively used, arsenic is also largely employed. One notable feature of this substance, and one also which gives it a special power of affecting us to our detriment, is the remarkable ease with which it becomes volatile. It may be readily diffused in the form of gas, or minute solid particles, and is thus brought into close contact with us in our homes. Green is a very pretty color on walls, but we would say, take care of it.

A Story of De Foe's Shrewdness.—A too adventurous book-seller went to De Foe in great distress one day. He had published a large edition of a very dull and heavy book, called "Drelincourt on Death," with "several directions how to prepare ourselves to die well," and the public, not much relishing unauthorized direction of that sort, had stubbornly refused to buy it. De Foe quieted the man's fears. Nothing short of a ghost from the grave, he said, could recommend such a book with effect, and a ghost from the grave the worthy book-seller should have. De Foe set to work and called up "The True History of the Apparition of one Mrs. Veal the next day after her death, to one Mrs. Bargrave, at Canterbury, the 8th of September, 1705, which apparition recommends the perusal of Drelincourt's Book of Consolation against the Fears of Death." Nothing could possibly be more exquisitely real than the business-like, homely, earnest and commonplace air of truth which was thrown into this narrative. It purported to be drawn up by "a gentleman, a justice of the peace of Maidstone, Kent, a very intelligent person." The "discourse is attested by a very sober and understanding gentleman, who lives in Canterbury, within a few doors of the house in which Mrs. Bargrave lives."

The justice "believes his kinswoman to be of so discerning a spirit as not to be put upon by any fallacy," and the kinswoman positively assures the justice "that the whole matter, as it is related and laid down, is really true, and what she herself heard as near as may be, from Mrs. Bargrave's own mouth, who, she knows, had no reason to invent or publish such a story, or any desire to forge or tell a lie, being a woman of such honesty and virtue, and her whole life a course, as it were, of piety." And what said the ghost? The ghost said that Drelincourt's book on death was the best book ever written on the subject. Dr. Sherlock was not bad, two Dutch books had merit, several others were worth mention, but Drelincourt, she protested, had by far the clearest notions of death and the future state of any. The narrative was immediately appended to the book and a new edition advertised. It flew like wild-fire. Nay, the book has been popular ever since. Mrs. Veal's ghost is still believed by thousands in England.

Conversational Stop-gaps.—There is doubtless a psychological reason for even the most trivial expression. A man desires to place himself *en rapport* with his interlocutor, to please or conciliate him, and from such half-conscious motive he says "you know" or "of course," even when the words are irrelevant. Then comes habit, with her chains, and he says it still oftener and less appropriately. Habit! Yes, and convenience too; for with the cultivated as well as the uncultivated, it is found extremely convenient to have some facile word or phrase in the mind, which will come without thought to the lips, and round off a sentence in no time. Such pet phrases form many a character in novels and on the stage; and in real life, too, they often come to be parcel of a man's idiosyncrasy, or to seem so to his neighbors. Women, with their softer fiber and their sweeter natures, are generally content to use in common the airy nothings of the moment; to say (as they do just now), "Are you *intense*?" or to stand by the peren-

nial adjective "nice," and the immemorial "Oh." I know an able man, and of some mark, who always begins his assertions with the words, "really and truly." I know another man whose comparisons invariably start with "so to speak." I know a third man, who regularly informs us that so-and-so can not be done "in any shape or way."

THE BOOMERANG.—This curious weapon, peculiar to the native Australian, has often proved a puzzle to men of science. It is a piece of curved wood, nearly in the form of a crescent, from thirty to forty inches long, pointed at both ends, and the corner quite sharp. The mode of using it is quite as singular as the weapon. Ask a black to throw it so as to fall at his feet, and away it goes fully forty yards before him, skimming along the surface at three or four feet from the ground, when it will suddenly rise in the air forty or sixty feet, describing a curve and finally drop at the feet of the thrower. During its course it revolves with great rapidity, as on a pivot, with a whizzing noise. It is wonderful so barbarous a people should invent so singular a weapon, which sets laws of progression at defiance. It is very dangerous for a European to try to project it at any object, as it may return and strike himself. In a native's hand it is a formidable weapon, striking without the projector being seen; like the Irishman's gun, shooting around a corner equally as well as straight forward.

THE NIAGARA PARK.—So we are to have a natural park at last. Not so far away as the Yosemite Valley is it to lie, but right in the Empire State, near the center of our highest developments. And it is about time that nature's most generous gifts should be made available to the general public. Decisive action has been taken for the acquisition of the ground in the neighborhood of Niagara Falls as an international park, and so preserve visitors from the innumerable annoyances to which they are at present subject. Again and again as we have visited this grand spot we have wondered at the callous indifference of Americans. What other nation on the face of this earth would tolerate such extortions of private citizens on a spot which belongs to the nation and should be easy of access, not only to every American, but to the whole world? We are glad then to record that at last one national disgrace is to be wiped out, and we shall have one of the most attractive spots of this earth opened to all, and put in such condition as is befitting the place. The plan proposed is to take a strip along the bank varying from one hundred to six hundred feet in width, extending two miles from the new suspension bridge to the head of the rapids, and plant it with trees, to shut out from view the ugly bazaars, manufactories, booths, and hotels, which destroy the natural scenery of the banks. The plan also involves the purchase of Goat and Bath Islands. It is the unanimous opinion of the commission that New York should proceed to reclaim her side of Niagara without reference to what Canada may do. One may indicate that the recession of the Falls since 1842, when a trigonometrical survey was made, has been something over one hundred feet.

A PRIMITIVE NATION—OUR NEXT-DOOR NEIGHBOR.—The new Mexican inter-ocean railway across the Tehuantepec Isthmus is marked out to pass through the State of Chiapas, which probably contains the only population in the world which possesses no iron, nor any thing in the shape of an iron industry, even of the crudest form. For the distance of eighty miles around Palenque, the capital, not a single blacksmith can be found, and the only articles in the shape of iron are axes and machetes imported from the United States. Nails are unknown, all the wood work being held together by cord or the tendrils of the vines, and even the tortilla is prepared by grinding the maize between stones. The new railway which will run through this territory has clearly a well-defined educational as well as commercial development to undertake.

PAPYRUS is the Greek name for paper. It was first introduced into European countries by Samarcand from China. Historians place its introduction in the year 651. Its discovery rapidly spread over Europe, and at Mecca, in 707, it was manufactured from a pulp prepared from vegetable fiber and cellular tissue. In the eighth and ninth centuries the bulls of the pope of Rome were written on paper made from cotton, Germany and France following in the year 1314. The first paper made in Egypt was from the pulp of the species of the reed called papyrus. It is wonderful what

progress has been made in the adapting of paper to the wants of our growing nation in the last twenty-five years. To-day America makes the best paper and begins to supply all countries east of it.

SECULARIZATION OF THE PARIS SCHOOLS.—M. Herold, prefect of the Seine, recently gave at a meeting of the Paris municipal council, the facts concerning the late secularization of the common schools. Altogether, he stated, he had secularized in Paris thirty-two congregational establishments, and there remained one hundred and ten to be secularized. In the rest of the department he had secularized fifteen schools. The chief difficulty he had found was in procuring competent teachers. He said that many of the Christian brothers had applied for masterships in the lay schools, and had been accepted. The lay teachers cost more than the congregationalists, because the authorities paid them higher wages in order to get more qualified teachers. He stated that in almost every quarter freed congregationalist schools had been started by the side of the secularized schools; but in spite of this fact, the number of pupils in the lay establishments continued to increase. Out of eleven thousand pupils belonging to the schools that had been secularized, seven thousand had remained there, and four thousand had joined the free congregationalist schools. In conclusion, M. Herold declared that the government was firmly resolved to carry out the programme of secular education, but at the same time to be prudent and not ruffle the sentiments of the people by too hasty and too sweeping transformations in the public-schools.

LISZT AND PRINCESS METTERNICH.—Liszt, the great pianist and composer, is one of the most independent of men, and never acknowledges any control but that of friendship and respect. "I have seen him at imperial courts," says a friend, "when he walked through the salons with the fine, grand air of a perfect gentleman, gracious to all, treated with reverential respect by all, but never deigning to touch the piano, and royalty, even, not daring to ask him." Liszt has always been remarkable for this social independence. When he was a young man, in the very brilliant period of his early popularity, some thirty or forty years ago, he visited Vienna. The celebrated Princess Metternich, wife of the great diplomatist Metternich, was the chief of society. Her salon was the great one of the day. She was a brilliant, captivating woman; clever, full of fine society wisdom; one of the last of the race of grand dames. The bluest of blood ran in her veins, and she was as haughty as Lucifer at times. At one of her receptions, her husband, who had invited Liszt, took the young artist, about whose musical and private life all the gay people of Europe were talking, up to the princess, and introduced him. She was in one of her most haughty moods, as it happened.

"Your first visit to Vienna?" she said, looking full in the handsome, stately young man's face; "I hope you are doing well in your business."

"Ah, madame la princesse," replied Liszt, "I have no business. That vexation belongs to diplomâts and bankers."

For one instant, the whole social high world of Vienna looked on, breathless at this passage of arms between the queen of society and the celebrated artist whose social successes equaled his public ones. The princess and Liszt gazed steadily at each other; neither flinched; then she yielded graciously and, taking his arm, walked through the salons with him, and was as charming to him as if he had been a prince of the imperial blood. From that time forward Liszt had no better and truer friend than the spoiled child of society.

WHAT OF THE WORLD'S REMEMBRANCE?—One of the most striking examples of the world's indifference the present fortune of a great Philadelphian furnishes. The financial disasters which have overtaken Mr. George H. Stuart, one should suppose, are good cause for public sorrow. He was one of those rare men who use large means as a trust for the benefit of their fellows. His fortune, which had grown to be very large, was a public fund to which suffering and want found ready access, he being only the laborious steward whose duty it was to watch for opportunities to spend what the Lord had given him in the Lord's work. His private charities have been so numerous that, for very number his right hand has probably forgotten the gifts of the left; but they are known by the multitude to whom they gave new chances of life. Mr. Stuart's greatest charity was his work as the head of the United

States Christian Commission during the civil war. His tireless activity laid the whole country under contribution for the comfort and happiness of the camps in the South. In money alone, over six million dollars was disbursed. To such services, and to a character which has been more than equal to the demands of these great opportunities, the country owes a debt which can be only partially discharged by the most sincere sympathy with the troubles which have come upon Mr. Stuart, and which have been caused by his own kindness of heart in endeavoring to assist his friends. And yet, if the city in which Mr. Stuart lives is an index of the whole country, men forget soon the good done them, and heed not the misfortunes of the very one who put balsam on their wounds in the hour of suffering. When all had been taken from Mr. Stuart, he being unwilling to retain any property whatsoever while in debt, there remained to him a portion as president of a banking institution. The other day the stockholders of the bank held an election. The issue made was whether a bankrupt should manage important financial interests. Stuart had lost his fortune. He could add nothing to the strength of the bank. So a board of directors was elected opposing the retention of the man who had once enriched the bank, and had helped to bring into life the commerce which Philadelphia boasts of. What next?

A Remarkable Ivy.—The property ivy has of adapting itself to circumstances is most strikingly illustrated by an incident related by Miss Strickland. The body of Catherine Parr, buried at Sudley, was disinterred, through curiosity, on several occasions. The last time the coffin was opened, it was discovered that a wreath of ivy had entwined itself around the temples of the royal corpse. A berry had fallen there at the time of the previous exhumation, taken root, and then silently, from day to day, woven itself into this green sepulchral coronal.

Typographical Errors.—As specimens of typographical errors, there are, among others, the following: By the insertion of one letter in place of another, a newspaper, not long since, reporting the danger that an express train had run, in consequence of a cow getting upon the line, said: "As the safest way, the engineer put on full steam, dashed up against the cow, and literally cut it into *calves!*" A Scotch newspaper, reporting the speeches at a Scotch centenary meeting, made one of the orators exclaim, with more truth than accuracy,

> "O Caledonia, stern and wild,
> *Wet*-nurse for a poetic child."

LITERATURE.

The cause of civil service reform may be said to have scored a point in the publication of a rather opulent octavo volume, giving the history and the present status of civil service in Great Britain, from so competent a hand as Mr. Dorman B. Eaton, who was chairman of President Grant's Commission on Civil Service, which Congress is trying to starve to death, by refusing it any funds with which to operate, but which still refuses to die on any such terms. In June, 1877, Mr. Eaton went abroad to study the system of civil service of Great Britain, with a letter of commendation from the secretary, in which he was also informed that he would "not be authorized to incur any expense for which the United States is to be held responsible." He went, nevertheless, and remained more than a year, carefully examining the subject of his studies, the result of all which he has embodied in a book just issued by the Harpers.*

As simply a case of literary labor, this work is a decidedly creditable affair. It is a real history, but of a subject that probably has waited till now to receive any thing approaching to such thorough and adequate treatment. It is, indeed, a novel theme for the pen of the historian, but under the hand of this writer it is by no means a barren one. It is, indeed, a history of "abuses"—such, however, may find parallels in most countries, our own not excepted—and it tells of reform, too, which, un-

* Civil Service in Great Britain.—A History of Abuses and Reforms, and their Bearings on American Politics. By Dorman B. Eaton. New York: Harper & Brothers. 8vo. Pp. 469.

happily with us, is still to be realized. But it is something to have the truth proclaimed, and especially so when done so ably, and even elegantly. Perhaps, at length, the country will awake to a just appreciation of those things, and sweep away at a stroke the festering abuses of our civil service.

DIVINE-RIGHT Episcopalians, other than Romanists, have a difficult task in hand in guiding their nondescript craft between the Scylla of Rome and the Charybdis of Protestant Free Church; and yet to this they are shut up by the facts of their positions. Some of their writers occasionally find time to leave off, for a time, their sneers and objurgations against the "sects," long enough to pay their passing respects to their older sister, in the way of a defense of some of the doctrines of the Reformation; but often they seem to be in mortal fear that their arguments will prove too much, and leave no room for their own lofty pretensions. We have a case in point in a volume,* issued under the auspices of the "Assistant Bishop of Maryland," in the form of an appeal from the "Fathers" to the "Forefathers," from the fifth to the first century. It is a good book, and though probably it will have but little influence among Romanists, it may tend to abate the Romeward tendencies of some who are still nominally Protestants, but seem to be more than half ashamed to confess it.

WE like the enthusiasm of a specialist, without much concern as to what may be the subject, provided always he will not make his mania over-aggressive. We have before us a specimen work of one of this class, in a neat little book, from the office of the *American Agriculturist*, on *Practical Tuxidermy*,† by which latter hard word is meant the art of preserving the stuffed skins of birds and animals. The author is a veteran in that kind of service, having acted in that capacity with Hayden's expedition in the Rocky Mountains, and of other parties engaged in government surveys. The publishers claim for the work that it is quite unique in its character,—indeed, that "there is no similar work in existence." Not being an expert in the art, we are not prepared to give any opinion respecting the value of the work, but can speak well of it as a specimen of book-making. The appended chapters on "Household Decoration," with natural objects—ferns, leaves, grasses, etc.—will be appreciated by ladies with rural tastes.

IT is often said, perhaps correctly, that history can not be written during the continuance of the epoch to which it refers; but Mr. Justin M'Carthy has come very near to producing an exception to this rule in his *History of our own Times*,* covering the period of the reign of Victoria. He tells his story with great clearness and directness of narrative,—passing from point to point of matters of temporary political interest, or whatever else for the time became the ruling topic in the public mind, with good judgment and with quite as much judicial fairness as could be expected of an Englishman writing of his own country's affairs, in matters that are entirely incapable of justification by the laws of public or private morality. Only the first of the two volumes is received,—which brings the record down to the end of the Crimean War—that monstrous mixture of crime and blunder. On the whole, the story of the Victorian era, in British affairs, is not of a character to assure us that modern civilization, though nominally Christian, is any nearer the morality of the New Testament than that of wilder and ruder peoples. Mr. M'Carthy treats his subjects with dispassionate fairness, and yet does not hesitate to censure freely the palpable iniquities of the foreign policy of the several governments. We know of no better book for a young person to use, in order to understand the living questions of the present time. The style is spirited, and the whole book very readable; the second volume will be awaited with lively interest.

MR. JAMES DE RUYTER BLACKWELL, of Fauquier County, Va., is a prolific writer of

* THE FAITH OF OUR FOREFATHERS: An Examination of Archbishop Gibbons's "Faith of our Fathers." By Edwin J. Stearns, D. D. Second edition revised. New York. Thomas Whittaker, 2 and 3 Bible House. 12mo. Pp. 380.

† PRACTICAL TAXIDERMY, and Home Decoration, together with general information for Sportsmen. By Joseph H. Batty. 125 illustrations. New York. Orange Judd Company. 12mo. Pp. 203.

* A HISTORY OF OUR OWN TIMES: From the Accession of Queen Victoria to the Berlin Congress. By Justin M'Carthy. In Two Volumes. Volume I. New York: Harper & Brothers. 12mo. Pp. 559.

verses. In poetical qualities they are not wholly without merit, being much better than the average of the productions of ordinary verse-makers. The language is usually pure and sufficiently elevated, the versification good, though not entirely faultless, and a slight poetic flavor may be detected in many of the pieces, which, in a few cases becomes decided and pronounced. We have in hand a square demi-octavo volume of two hundred and twenty-four pages (the title-page says there are three volumes, of which this is the first), a beautiful specimen of book-making, filled with about a hundred and fifty poetical pieces. The subjects are mostly religious, sentimental, amatory, patriotic (of the "Confederate" variety), and pastoral. The author will never rank among the great poets, and yet he is something better than merely a verse-wright; though three volumes filled with so much respectable mediocrity would seem to be rather too much of a good thing.

MR. JOHN MORLEY, who edits the *English Men of Letters*, must certainly be an Irishman, for he gives us, as the thirteenth subject, our own Mr. Hawthorne;* who, though he used the English language, was both by birth and character, and by residence, too, for most of his life-time, an American. But, since Burns and Scott and Burke and Goldsmith are classed as Englishmen by him, to include an American in the same category, is only to stretch an elastic rule a little further. And Mr. Henry James, Jr., the writer, has given us a really valuable sketch of one of our very ablest writers of fictions, with decidedly clear criticisms upon his various productions, and appreciative estimates of his character and place in English literature. This number will add largely to the value of the completed series, and raise, rather than depress, its average quality.

BESIDES its own proper and legitimate use, the Bible has been made to serve a variety of others, quite frequently very foreign to its real intent. Like other sacred things, it has been made into a fetich, by which to work wonders, and both bibliolatry and bibliomancy have come into use, of late; and, in connection with our Sunday-schools, it has sometimes been treated as a book of puzzles, and even as a jest-book. We would not, however, place the work,* lately issued by a New York house, in either of these classes, though it has some of the features of each one. This, however, contains a large share of valuable Biblical information; and, in the absence of more complete works on the same subjects, it may be used to profit.

IF all were true that is promised in the titles of books on hygiene, and kindred subjects, the medical profession would cease to be, and the inhabitants of the land would no more say, "I am sick." And yet people will continue to be sick, and books will continue to be published, telling them "how to be well." One of this kind, from the publishing house of S. R. Wells & Co.,† like many others of the same class, contains some good suggestions, and gives some desirable information respecting their avoidance and their cure. Such books may be used to profit, if only used intelligently and discreetly. But with not a few they are like edge tools in the hands of children.

NATURAL Philosophy, when it attempts to penetrate beneath the surface of things, and to find out the original sources of the forces of nature and their directing agencies, becomes little better than a series of not especially probable guesses. And even within the range of real phenomena it is often the case that only trained experts can know any thing of the matters discussed; and, judging from the disagreements and sharp conflicts among these, one may suspect that they are not always infallible in their determinations. An apparently truly learned discussion‡ of some of the

* ENGLISH MEN OF LETTERS. Edited by John Morley. *Hawthorne.* By Henry James, Jr. New York: Harper & Brothers. 12mo. Pp 177.

* BIBLICAL THINGS NOT GENERALLY KNOWN. A Collection of Facts, Notes, and Information concerning much that is Rare, Quaint, Curious, Obscure, and Little Known in Relation to Biblical Subjects. New York: Dick and Fitzgerald. Cincinnati: Robert Clarke & Co. 12mo. Pp. 379. Price, $1.50.

† HOW TO BE WELL: Or, Common-sense Medical Hygiene. A Book for the People. Giving directions for the Treatment and Cure of Acute Diseases without the use of Drug Medicines. By M. Augusta Fairchild, M. D. New York: S. R. Wells & Co. Cincinnati: Robert Clarke & Co. 12mo. Pp. 180. $1.00.

‡ SOLAR LIGHT AND HEAT. The Source and the Supply—*Gravitation*: With Explanations of Planetary and Molecular Forces. By Zechariah Allen, LL. D. New York: D. Appleton & Co. Cincinnati: Robert Clarke & Co. 8vo. Pp. 241. $1.50.

more occult laws of physics in relation to solar light and heat and gravitation and the part played by electricity in both inorganic and organic matter, is given in the work named below. We commend it to any who delight in that kind of studies, but do not indorse in advance any of its conclusions.

SOME books, designed especially for the holidays, failed to reach us till our holiday number (January) had gone to press; but, as they are not altogether unsuited for other seasons, we give them a passing notice.

Fords, Howard, and Hulbert, New York, give to their young readers "*The Merry-go-Round: Stories for Boys and Girls*," by R. W. Raymond (large 16mo, pp. 217), finely printed, neatly, but not profusely illustrated, with pleasant and good reading-matter. $1.50.

J. B. Lippincott & Co. publish "*The Boys' and Girls' Treasury*, a Picture and Story Book for Young People," edited by Uncle Herbert, who will be remembered as the editor of several former publications of the same description. It is a very good book of its class, the pieces are short and sharp, and such as children delight in, and the abundant illustrations are fairly good. 12mo, pp. 320.

From the same house we have, also, "*The Picture Alphabet.*" 4to, pp. 56. Printed on Bristol boards, with large and small letters, easy spelling and reading lessons, and pictures to match.

All of these come to us from Robert Clarke & Co., 65 West Fourth Street, Cincinnati.

THE National Temperance Society, 58 Reade Street, New York, has just published, in a pamphlet of twenty-four pages, Canon Farrar's able and convincing address recently delivered at Sheldonian Theater, Oxford, England. It is a powerful argument in favor of restrictive and compulsory legislation against the liquor-traffic, and should have the widest circulation. By mail, ten cents; one dollar per dozen.

"APPLETONS' Library of American Fiction" has among its later issues: *A Gentle Belle*, a novel. By Christian Reid. 8vo, pp. 152. Paper covers, 50 cents. *Di Cary*, a novel. By M. Jacqueline Thornton. 8vo, pp. 231. Paper, 75 cents.

THE last issued, making twelve in all, of Professor John Morley's "English Men of Letters" is Milton, by Mark Pattison, B. D. It may seem to be a very absurd thing to attempt to condense a biography into two hundred pages, which another author has just completed in six huge volumes; and yet it is quite possible that this work will find as many readers as that. It is simply a sketch, both biographical and critical—appreciative, but not especially eulogistical—but quite free from the personal depreciations with which some have liked to belittle a great name.

AMONG the later publications of the National Temperance Society and Publication House, whose catalogue is becoming a long one, is a thick octodecimo of over 400 pages, by the well-known temperance story-writer, Mrs. Mary Dwinell Chellis, author of half a score of volumes, besides stories and side-pieces beyond count. This one, "From Father to Son," is the story of an English squire whose drinking habits become the inheritance of his sons, by both blood and example; the whole, in its results, teaching and emphasizing the doctrines of total abstinence.

COOKERY books are the vogue of the times, and all sorts of people, from learned divines and dignified Church officials, all the way down to housemaids and scullery-cooks, are making them. A good one of its class, all the better because it is of moderate size, is "The Art of Cooking, a series of Practical Lessons," by Matilda Lees Dods, of South Kensington School of Cookery. Edited by Henrietta de Conda Sherman. G. P. Putnam's Sons.

A WILD French story is that entitled "An Involuntary Voyage," which, done into English, has lately been published in a book,* by the Harpers. It is full of any amount of odd and quaint things, improbable and extravagant, and yet it contains a great amount of agreeable and valuable information about sea voyaging, and the various countries visited. It is vivacious, and very *Frenchy*.

THE same house has just issued "Readings and Recitations, No. 3," edited by Miss L. Penny, the compiler of sundry other books of similar character, including Nos. 1 and 2

*AN INVOLUNTARY VOYAGE: By Lucien Biart Translated by Mrs. Cashel Hoey and Mr. John Lillie Illustrated. New York. Harper & Brothers. 12mo. Pp. 200.

of this series. It is a paper-covered duodecimo of about 100 pages.

VICK'S FLORAL GUIDE for 1880 (Rochester, N. Y.) combines the properties of a business annual with those of an illustrated magazine, and a guide-book and instructor for the lawn and garden. Its utility for every one who has a square rod of ground that may be cultivated, is seen by a simple look upon it. Its hundred pages fairly flame with pictures, each of which is an object lesson, and though sold for five cents, it is fine enough for a gift book. It is doubtless doing a good work in developing and shaping the public taste for flower culture and home gardening.

Harper's Franklin Square Library. Latest issues, 100. *The Munster Circuit,* by J. R. O'Flanagan. 101. *Sir John,* by the author of "Anne Dysart." 102. *The Greatest Heiress in England,* by Mrs. Oliphant. 103. *Queen of the Meadow,* by Charles Gibbon. 104. *Friend and Lover,* by Iza Duffus Hardy. Fifteen cents each. 105. *Cousin Simon,* a Novel, by Hon. Mrs. Robert Marsham, ten cents. Sent by mail, postage prepaid, to any part of the United States on receipt of the price.

EX CATHEDRA.

RE-WRITING HISTORY.

THOSE who are aware of some of the rivalries of two of our great publishing houses — each having a Cyclopædia to care for — must have been a little surprised at the remarks of Mr. Joseph Cook, in one of his recent lectures, respecting Appleton's Cyclopædia. Probably he was himself quite unaware of the bearing of the words he used, as well as of the inspiring *animus* of some of the criticisms that have been directed against that work; and which quite likely prepossessed his own mind. There is another Cyclopædia published in this country, a rival to Appleton's, whose proprietors very naturally have not been indifferent to this matter of discrediting the larger and more voluminous and costly work. It is also well known that in such cases words of praise, and equally so of depreciation, whether from press, or platform, or pulpit, do not always lose their reward. It is well-known that a great outcry has been raised against the American Cyclopædia on account of its supposed tenderness towards Romanism and the Church of Rome; and the persistency with which that charge has been kept before the public, by means that publishers know very well how to use, makes it probable that something else than disinterested zeal for the truth and the right has had something to do with the matter. The suspicion that has been uttered, that probably Mr. Cook wanted a Cyclopædia, we are confident does him injustice, for certainly he is quite incapable of acting from such a motive as that remark suggests. It may be doubted, however, whether he spoke advisedly, as he probably has only a very partial acquaintance with the subject; and it may be regretted that, without intending any thing of the kind, he should have brought aid and comfort to one side of a contest which is largely a scramble for profits.

Appleton's Cyclopædia was at first prepared, and has now been thoroughly revised by two native-born scholars and men of letters, who have never been suspected of leanings towards Romanism. In the preparation of that work it was a rule adopted from the beginning, and steadily maintained to the end, to have all articles on Church history and ecclesiastical affairs submitted to some one who might be selected as well-informed respecting, and favorably disposed toward, the sect or denomination specially treated of, so as to keep out any thing objectionable, as it was much desired for a variety of reasons (not excluding prospective sales) to have the work as widely acceptable as possible. Methodism was thus represented, both in the original preparation of the work and also in its recent revisal, by men who were accounted worthy of the work assigned them; and the same course has been pursued toward other denominations, including the Roman Catholics. The tendency of all this is obviously highly prejudicial to the truth of history,— and, indeed, it is for that reason that it is favored. It seeks not to set forth the whole truth, but to obscure or cover

up whatever facts, though most certainly true, that, if told, may hurt somebody, and to blame or praise faintly, not as may be deserved, but as private interests or popular prejudices may demand. And yet it is as undeniable as it is lamentable that a very large share of the books prepared for general use are "doctored" after that fashion. The compilers and publishers of our school histories and readers are usually very careful not to print any thing that might offend any considerable classes of prospective purchasers and readers. For a quarter of a century before the rebellion such books either entirely ignored the subject of slavery, or else treated it with remarkable tenderness, both in the statements of the histories, and more especially in the selections of pieces for reading and declamation. That something of this nature may be found in Appleton's Cyclopædia is not improbable, though, after more than twenty years' use of it, we have not detected that tendency in any universal degree. We see, too, a like charge brought against M'Clintock & Strong's Cyclopædia, in which a Protestant Episcopalian is allowed to speak of his own sect as "that portion of the Church of Christ which has its local habitation in the United States of America."

It is no doubt true that history, as written down in the books and accepted as correct,—whether military, civil, or ecclesiastical,—is a very imperfect statement of the things pretended to be delivered. The story is told of an old author, who, when it was proposed to read to him from a book of history, protested against it, saying, "Read me fiction; that may be true,—but as to the history, I know that to be false." Personal knowledge respecting the facts pretended to be set forth in some popular history is not apt to enhance one's estimate of either the ability or the fidelity of the author.

Most persons are partisans in respect to some one or more living questions, and they require that their partisan views shall be put into the books, or, at least, that nothing opposed to them shall find place; and they who make books for all parties must be careful to offend nobody. And so we have, on the one hand, partisan histories and statements, and one-sided constructions of admitted facts, on almost every subject, prepared by those in interest; and, on the other, non-committal, garbled and euphemized records, that though not specifically untrue, are, as a whole, sadly untruthful. These evils are patent and not to be denied, and to the extent of their influence they pervert the truth and turn it into a lie; but how to correct them is not so obvious. And yet there is reason to believe that both the leading facts of history and the great principles and doctrines that they teach are substantially agreeable to the truth.

There is no doubt that the Church of Rome is at this time actively engaged in falsifying its own history, and that of Europe, through all the past career of that Church. The stories of the unblushing corruption, both public and private, of the Church during the Middle Ages; the bloody records of the Inquisition in Spain; the worse than fiendish wholesale murders of St. Bartholomew's day in France, and the relentless persecutions of the Albigenses and Waldenses, the Bohemian reformers, and the Lollards in England, are not what the children of that Church may be allowed to read; and since entire prohibition may not be possible, the whole record must be re-written; and in doing this Catholic authorities, not less than Protestant, if they relate any thing undesirable, must be discredited. And yet the lie will not stay told.

Coming much nearer to ourselves, we may find a case of making history to order, in the systematic efforts that are being put forth to put on record a South-side history of the late Civil War. A renowned Southern civilian began this work by preparing an elaborate history, in two great volumes, of "The War *between* States" (so he designated the "Great Rebellion"), putting the fundamental falsehood that permeated that whole movement into a single concise phrase, which he made the title of his work. And already there may be found, in the treatment of this and related subjects, in the discussions of the press and the forum, a disposition to smooth over its harsh features, to ignore its most important elements, and, above all else, to eliminate all the elements of morality from the cause that conquered — saving the nation at once from political disorganization, and from the horrid cancer of slavery, that was destroying it. But we are quite sure that all such efforts will fail of their purpose, and that as the great men and the great deeds of that era recede from

the present, as with lofty mountains in a wide landscape, distance will only demonstrate their greatness.

THE CIVIL SERVICE.

FEW proposed measures in the political affairs of the country have a more vital connection with the public welfare than that known as the Civil Service Reform, and scarcely any other is so beset with difficulties in the way of its practical consummation; and this is not because of any special difficulties in the work itself, but because of the vast and complicated though corrupt interests that stand opposed to it. It would seem to be the simplest thing possible for the government, like any other parties having work to be done, and being ready to pay for it, to find out good and competent men to do the work; and having gotten together an adequate force, it would seem to be a condition essential to success to continue them in their places so long as they render satisfactory service. And as some special training is necessary in most cases, it would seem to be wise to admit new-comers only to the subordinate places, and to fill the higher ones by promotions from the lower. This would be administration in favor of good and economical government; but this is not the kind of administration that is chiefly favored by the "politicians," who run the government.

It is a little remarkable that some of the worst abuses of the old feudal system, and the corrupt administrations of the restored Stuarts in England, have become thoroughly interwoven into our governmental affairs. Under the former the barons gave the offices to their retainers; and under the latter the hangers-on of the court and of the court party had to be provided for, nominally as public employés but really as parasites on the body politic. In this country the same bad principle of action became a recognized policy of the administration when it was shamelessly announced that the "spoils" of patronage belonged to the ruling party. The practical enthronement of the "spoils" system dates from the administration of General Jackson, which is also the date of the beginning of not a few other abuses.

But though the evils of this system are obvious and frequent, how to remove them is a very difficult question. Scarcely any abuses, no matter how great and obvious, will fail to find advocates so long as they bring gains to the few, though at the much greater costs of the many; and accordingly the "spoils" system in the public service has the practical favor of the great body of the professional politicians who rule and rifle the nation, and for manifest, though very unpatriotic and dishonorable, motives. It is by this craft that they have their wealth. Under its influence the public employment, or rather its emoluments, are made a stock in trade, with which the larger politicians govern the smaller ones, compensating them for their partisan services by places in the public employ. It thus comes about that the political parties exist and are maintained not to promote certain political or governmental principles, but as combinations for the maintenance in places of power and profit of certain political leaders, at the public expense. Places are disposed of, not in the interests of the public service, but as compensation for political services rendered to some party-leader, the fitness of the appointee being but little considered; and as the place was paid for before it was received, it is often considered chiefly a sinecure, of which the incumbent is secure, however idle or faithless, by reason of the power of his patron. It is plain that, under such a system of manning the public service, inefficiency and corruption will be the rule rather than the exception. Only a decidedly undesirable class of men will consent to occupy such positions which always have the odor of dishonorable associations, and are held by so precarious a tenure as to render them undesirable.

The viciousness of the system is sufficiently manifest, but the way to get out of it is not so easily told. The men by whom the reform must be effected—if it is to be done—are those who are using it for their own selfish purposes. Members of Congress, of either house, desire the patronage of the government with which to meet the obligations incurred for the partisan or personal services of their minions, by which they secured their elections, and by which in time to come they hope to be re-elected or raised to higher places. By such influences there has grown up a class of professional politicians, who are simply parasites feeding upon the public. They are the active members of political associations; they keep themselves well informed about all the politi-

cal maneuverings of their localities, or of the great parties; they run the "primaries," and manage the conventions, dictate the nominations, and occasionally make exchanges with the leaders of the other side. From such men not much can be hoped in favor of reforming the civil service.

The record of President Hayes on this subject, in the way of promises, has been all that could be desired. He was elected on a platform pledged to the reform, which he himself emphasized in accepting the nomination, and again in his inaugural address; and as he had declared in advance that he would not be a candidate for re-election, he was in a position to do right at but little expense. But, in practice, he has both positively and negatively disappointed the hopes of friends of the reform. And yet something has been done, and in such a case small favors must not be despised. Very much is gained by having the subject brought to the public attention; for if there is any public virtue remaining among the people, they will not long tolerate so flagrant an abuse after it has been exposed to notice.

BISHOP HAVEN'S DEATH.

WE have had great bishops and remarkable divines who never even got as far as the episcopal honor. Indeed, a Church which can boast of counting within one single century such names as Asbury, Janes, Fisk, M'Clintock, Dempster, Durbin, and a hundred like them, has reason to be proud of its great achievements and of the men who did the work. But none of the men who have been identified with American Methodism combined in themselves greater powers, nobler sentiments, better purposes, wiser judgments, greater efficiency, than the one whose name we have just entered among the annals of the dead. The friend of the black man, the lover of his country, the devotee of his God and Church, the advocate of all that is good and true and beautiful, Gilbert Haven died too soon for the happiness of his fellows and the prosperity of the Church militant. His place will never be filled again by one man. So many different characteristics were blended in him that it will take half a dozen men, and great men at that, to supply Gilbert Haven's place. His career of greatness began as editor of *Zion's Herald*. What work he did on that paper remains to testify for him. The editorial and the review pages while he was in control at Boston mark a brilliant epoch in the history of the *Herald*. We had read the paper regularly for years after we came to be interested in American Methodism. Never did we enjoy greater feast of intellect and imagination and heart than in our contact with Haven's writings. It was a very feast of reason and of soul. A few years ago, when the mantle of the episcopacy was first laid upon him, not a few wondered at the choice of a man so outspoken, so positive in a place where silence and discretion are considered the best commendations. But the work he did proved how well New England had known Gilbert Haven. When, a short time after, at a Boston prayer-meeting, he had dared to praise the man who had saved our nation, and in the heat of displeasure against a section of our country where the law of the land is mocked, cried out, "Brethren, pray for General Grant!" it was our pleasure to meet the bishop just as he came from the hub to lecture in an inland town of the Empire State. It was our first meeting. For hours we sat together and talked about literature, art, ecclesiastical history, archæology, politics, home and foreign—a thousand and one things we talked about. I said we talked about—no, we listened, spell-bound; he talked. There was an unfolding of a master-mind, and we felt the Church had not many men like Gilbert Haven. It was his greatness that impressed us then. It is his goodness that impresses us to-day. What a record he has left us of piety and devotion! His last record is the most precious one we possess as a Church. Although Bishop Haven did not die until six o'clock in the evening, it became evident already in the morning that his end was near, and his physican so said to him. His reply was this: "When that agony was upon me at the beginning of this illness I feared it was the grip of death." He expressed a wish to see as many of his friends as possible, and during the day many called upon him, to each of whom he had something to say. To one caller his remark was: "Good night, doctor; when we meet again it will be good morning." An hour before he passed away he fell asleep. On awakening, he looked up and said: "There is no river here; it is all beautiful." He did not speak again. J. H. W.

NATIONAL REPOSITORY.

APRIL, 1880.

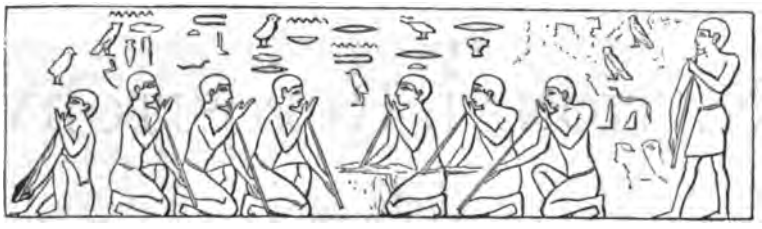
MUSICAL INSTRUMENTS OF ALL AGES.

GREEK INSTRUMENTS OF MUSIC.

A LOVE of music seems to be inborn with mankind, though the discordant sounds that satisfy the barbaric ear would painfully agitate the the tympan accustomed to what we call melody; and while the prehistoric swain blowing through a hollow bone may have produced a tender feeling in the heart of some antediluvian maiden, the same "music" to-day would be regarded with dismay.

The making of musical instruments began almost with the human race, and we have relics of antiquity that show us how instruments were made to produce musical sounds at a period prior to the existence of any language of which we have record. The forms of many of the most ancient instruments are preserved to us in the sculptures and paintings of antiquity, and the tombs and temples of Egypt tell unerringly of the musical practices as well as other details of the domestic life of the builders of the pyramids. One of the tombs in the pyramid of Gizeh bears a representation of a flute concert, and, according to Lepsius, it dates from a period as early as 2000 B. C. The eight musicians are arranged in peculiar form. Three of them, one behind the other, are kneeling and holding their flutes in exactly the same position, and facing them are three others also kneeling and holding their pipes like the others. A seventh sits with his back turned toward them, but like the rest he is also blowing his flute, while an eighth, who may be the leader of this primitive orchestra, holds his instrument in his hands, as if in the act of raising it to his lips. The division of the band suggests that they may be classed as *primo* and *secondo*, somewhat like the first and second violins in our modern orchestras.

An ancient Egyptian painting of about



CONCERT OF EGYPTIAN FLUTE-PLAYERS.

the same period as this quaint illustration of an antique band of flute-players represents a lyre performed upon by a man who walks in procession with others and with some animals unknown to the fauna of to-day. This interesting picture was discovered in a tomb on the eastern bank of the Nile; and, writing on this subject, in his "Manners and Customs of the Ancient Egyptians," Sir Gardner Wilkinson observes:

"If, when we become better acquainted with the interpretation of hieroglyphics, the 'Strangers at Beni Hassan' (the name of the place where the painting was found) should prove to be the arrival of Jacob's family in Egypt, we may examine the Jewish lyre drawn by an Egyptian artist. That this event took place about the period when the inmate of the tomb lived is highly probable—at least, if I am correct in considering Osirtasen I to be Pharaoh, the patron of Joseph; and it remains for us to decide whether the disagreement in the number of persons here introduced—thirty-seven being written over them in hieroglyphics—is a sufficient objection to their identity. It will not be

STRANGERS AT BENI HASSAN.

foreign to the present subject to introduce those figures which are curious, if only considered as illustrative of ancient customs at that early period, and which will be looked upon with unbounded interest should they ever be found to refer to the Jews.

"The first figure is an Egyptian scribe, who presents an account of their arrival to a person seated, the owner of the tomb, and one of the principal officers of the reigning Pharaoh. The next, also an Egyptian, ushers them into his presence; and two advance bringing presents, the wild goat, or ibex, and the gazelle, the productions of their country. Four men carrying bows and clubs follow, leading an ass,

ASSYRIAN HARP.

on which two children are placed in panniers, accompanied by a boy and four women; and last of all another ass, laden, and two men, one holding a bow and club, the other a lyre, which he plays with a plectrum. All the men have beards, contrary to the custom of the Egyptians, but very general in the East at that period, and noticed as a peculiarity of foreign uncivilized nations throughout their sculptures. The men have sandals, the women a sort of boot reaching to the ankle—both of which were worn by many Asiatic people. The lyre is rude, and differs in form from those generally used in Egypt."

In our engraving only the part of the painting where the lyre is introduced is

shown as illustrating the subject of this writing, but the description of the whole which we have quoted lends it additional interest.

GREEK HARP AND LYRES.

There are various opinions in regard to the musical instruments of the Greeks, some claiming that they derived their system of music from the Egyptians, and others that it had its origin in Asia. The balance of opinion and testimony favors the latter argument, and particularly as regards stringed instruments, their Asiatic origin seems doubtless. A superb Greek vase in the museum at Munich bears an admirable representation of a harp which, in general construction, resembles the Assyrian harps; the number of strings and location of the tuning-pegs on the upper part of the sounding-board exactly correspond to those. If the harp shown on this vase is indeed a veritable Greek harp, as there is no reason to doubt, then it is more probably of Asiatic parentage than of Egyptian. The complete design on this vase, of which we give only three figures, represents the nine muses. Those shown in the illustration are Polyhymnia, with her harp, which she touches with both hands, using the right for the treble and the left for the bass, and Kalliope and Erato, with lyres.

GREEK LYRE.

The lyres of the Greeks were various and tasteful, and properly belonged to a highly cultivated people. Their love of beauty is shown in the design of these lyres, and the same feeling no doubt induced their artists to introduce that more graceful instrument into their pictorial art, where we might more naturally expect to find illustrations of the harp, which is rarely represented in the paintings and sculptures of Greece. There is a dilapidated fragment of a Greek lyre in the British Museum. It is a part of the wooden frame, and about eighteen inches in length, but unfortunately too much decayed and broken to be of much value or interest.

The flutes of the Greeks were almost as numerous as their lyres. The single pipes were called monaulos, and the double ones diaulos; an example of the latter, found in

a tomb at Athens, is in the British Museum. It appears to be made of cedar wood, and the tubes are fifteen inches long with six

THE KING.

finger-holes to each, five on the upper side and one on the under side. Each tube has a separate mouth-piece. Some of the Grecian pipes were more elaborate, having in some instances as many as nine tubes, seven being a common number. A beautiful Roman mosaic of a girl playing upon a pipe was exhumed on the Via Appia in 1823, and is now in the British Museum. The form is the same as some of the Greek pipes, but the *holmos*, or mouth-piece, is somewhat like that of the oboe of modern times. Persons who have heard the wild, discordant sounds which the Chinese call music, will not be surprised to see the strange instruments which they sometimes use to produce them. There are numerous legends connected with the music, as well as with every thing else of the Asiatics, and one of them is that their scale was obtained from a marvelous bird—a kind of Chinese phœnix—called foung-hoang; and another that when Confucius first heard Chinese music, he was so enraptured that he could eat nothing for three months—an effect that would seriously interfere with the success of popular concerts were it caused by our music to day. It was said, too, that Kouei, the Orpheus of the Chinese, could draw wild animals about him and hold them spell-bound by his performances on the *king*, a kind of rude harmonicon constructed of slabs of sonorous stone suspended from a bamboo stand, and struck with a wooden mallet.

Another instrument with which the Chinese produce favorite sounds is their drum, which is usually held upon a pedestal or laid upon a cushioned stand; these are sometimes of great magnificence and cost, and one or two very elaborate specimens have been seen in the great art repositories in New York, the b dies formed of metal, richly adorned with *cloisonné* enamel, and the parchment heads decorated with various devices in color and gold. Another curious instrument is the *poongi*, consisting of a hollow pipe, at either end of which is placed a large gourd, or hollowed cuddos nut, which act as sound-

CHINESE DRUM.

ing-boards, and increase the volume of sound emitted by the four strings.

The love of music was strong among the Persians, and many of their instruments

were elaborate and beautiful, though the development and outgrowth of rude beginnings. Carved upon a mighty rock called Tackt-i-Bostan, in the vicinity of the town of Kermanshah, is a representation of such an instrument as was used by the Persians in the sixth century, and it presents a striking contrast to the magnificent harp of later days. When the Arabs conquered Persia in the seventh century they found the musical cultivation and the development of musical instruments far more advanced than in their own land, and readily adopted the Persian system and instruments, and there is little doubt that the earliest record we have of Arabic music is really based on the more ancient music of the Persians. Another favorite instrument was the *kanoon*, somewhat like the modern dulcimer, which was strung with lamb's-gut strings, and played upon with small sticks held in the hand, or little plectra fastened to the fingers.

The engraving which we present is taken from an antique Persian painting, and represents an old *santie*, another instrument of the same character played upon with curved sticks. With the Arabs as with the Chinese great power is ascribed to their musical performances, and there are many legends illustrating it, one of which tells us that a celebrated performer, Al-Farabi, acquired in Spain such wonderful proficiency that his fame extended to Asia. The caliph heard of the celebrated musician, and sent messengers to Spain with costly gifts to tempt Al-Farabi to the court of Bagdad. But the player feared that if he once reached the luxurious court of the caliph he would be restrained from returning to the home he loved so much, and hesitated. At last, however, he resolved upon an expedient which might enable him to fascinate the caliph without recognition.

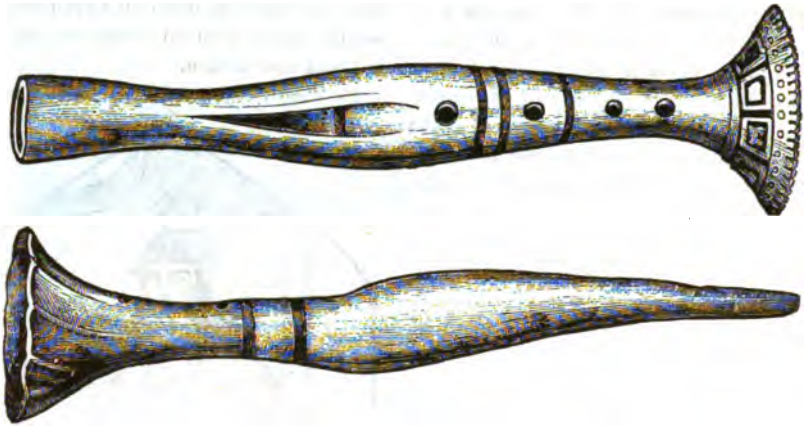
INDIAN WHISTLE.

He disguised himself in a mean dress, and

THE SANTIE.

appeared at court on foot just as the caliph was being entertained with his daily concert. Al-Farabi, though unknown to every one, was permitted to exhibit his skill upon the lute and had scarcely begun playing when the courtiers and all present were seized with violent laughter, which only subsided when the player changed his theme. Then all became sedate, some began to sigh, and in a short time all eyes were suffused with tears of sadness. Again the theme was changed, and the audience were excited to such a pitch of rage that there was danger of a tumult, which Al-Farabi seeing changed his mood to a more appeasing one. After this wonderful exhibition of his skill he performed in a somnolent vein and putting his hearers all fast asleep took his departure.

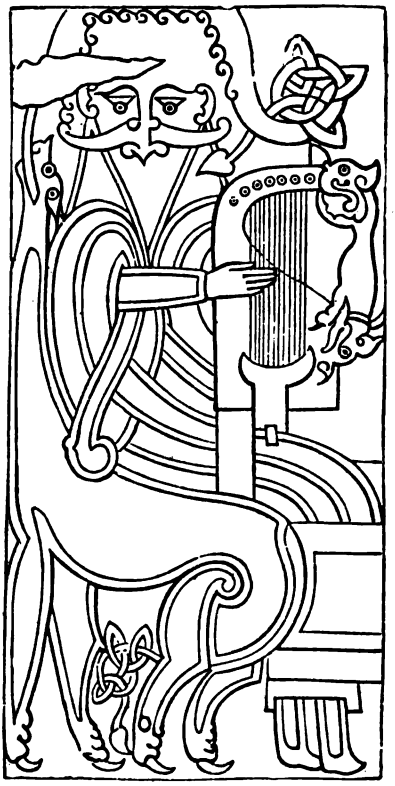
This legend may have suggested to the



FORMS OF AZTEC PIPES.

poet Dryden the theme for his "Alexander's Feast," wherein the wonderful flutist Timotheus is described as animating and subduing various passions at will.

The American Indians have left us many records of their life and manners, not the least interesting of which are the rude musical instruments that were used by the aborigines before this continent was revealed to European civilization. The Aztecs in Mexico and the Peruvians have also left many evidences of their love of music, and many of the pipes and flutes found in the antique tombs are in a nearly perfect state of preservation. The Aztec's pipe, called by the Spaniards *pito*, is not unlike our flageolet. The well preserved specimens which we present in the engraving are in the British Museum. Some ruder instruments, possessing only the means for producing a single tone, have been found in the graves of Chiniqui Indians in Central America; and others again have four and five tones, but are not set to any recognized scale. Some of these instruments, which are little more than whistles, have a little ball of baked clay in the interior, which is blown about by the wind of the player, producing a shrill bird-like sound like the common "bird whistles" of the present day. The ancient European musical instruments were much more like the Asiatic than those now in use, for where a nation has not attained to a high degree of civilization the growth of an art like music is, of course, slow. While Europe has advanced so rapidly and attained such a high degree of proficiency in musical culture it is a fact that among some of the nations of the East the music and the instruments are nearly like those in use three thousand years ago.

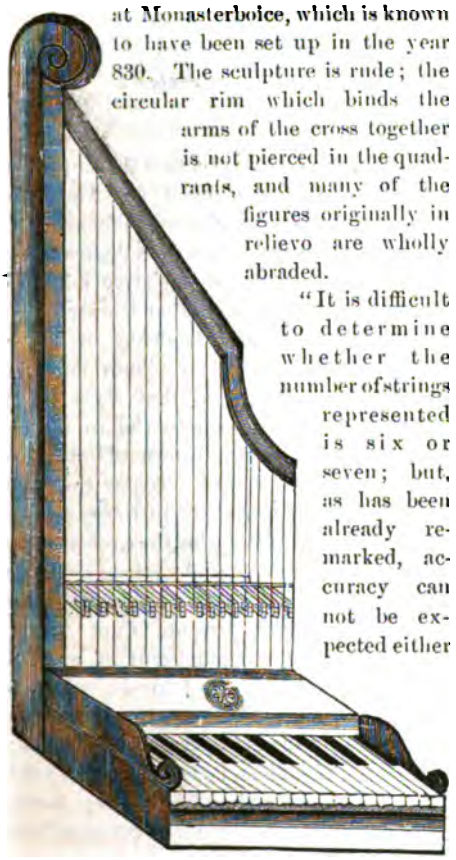


HARP.

Among the Anglo-Saxons the harp was a favorite instrument, and Bunting, in his "Ancient Music of Ireland," gives an illustration of a sculptured figure of an old harp from the Church of Ullard in the County of Kilkenny. This curious relic is said to antedate the year 800, and Bunting says of it:

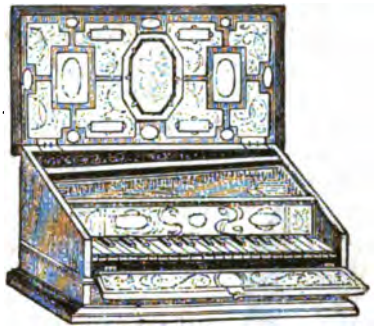
"The drawing is taken from one of the ornamental compartments of a sculptured cross at the old Church of Ullard. From the style of the workmanship, as well as from the worn condition of the cross, it seems older than the similar monument at Monasterboice, which is known to have been set up in the year 830. The sculpture is rude; the circular rim which binds the arms of the cross together is not pierced in the quadrants, and many of the figures originally in relievo are wholly abraded.

"It is difficult to determine whether the number of strings represented is six or seven; but, as has been already remarked, accuracy can not be expected either in sculptures or in many of the picturesque drawings."



THE VIRGINAL.

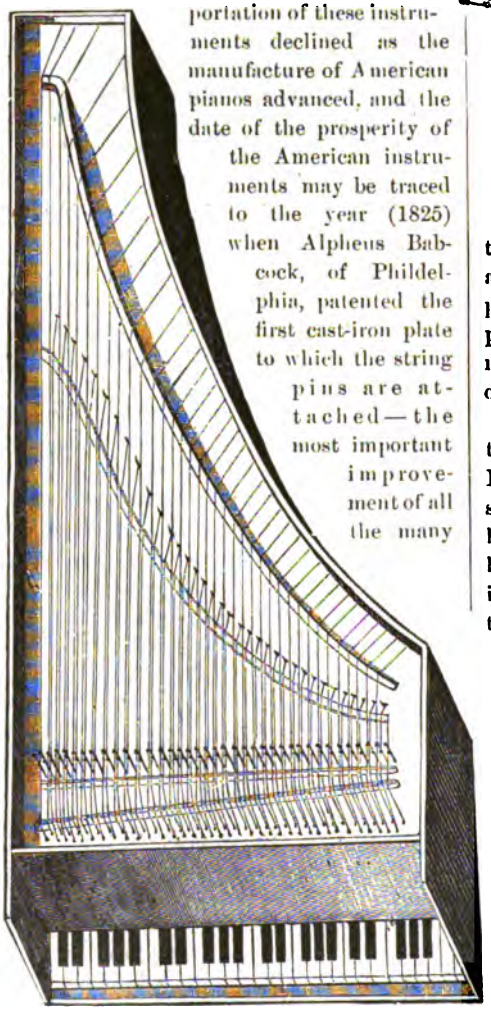
All through the Middle Ages we find the occurrence of stringed instruments, in the illuminated manuscripts of that period, and even earlier the harp is frequently introduced, and the quaint illustration which we engrave of the Psalmist occurs in one of these, which is preserved in the British Museum. As in our modern society the piano-forte is almost exclusively the instrument



CLAVICITHERUM.

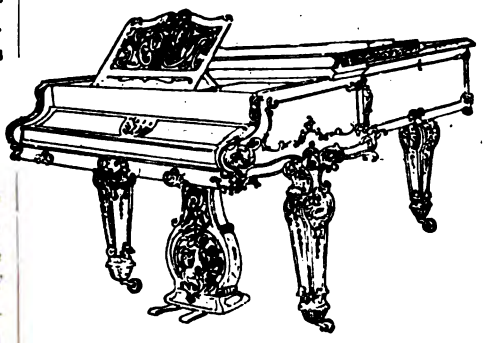
of the domestic circle it is interesting to note the advent of the first stringed instrument played upon by means of a key-board, and we find that it occurred about the year 1300, and was called the "Clavicitherum," a very primitive contrivance, consisting only of a covered box strung with catgut strings of different lengths, and struck by hammers on one end of movable rods which terminate at the key-board and act as levers. The spinet, virginal, and harpsichord are other forerunners of our present piano-forte, which did not appear until early in the last century. Since its advent the popularity of the piano-forte has steadily progressed, until at this day it is a part of almost every refined home throughout the civilized world. Although the "piano-forte" has become a household word, there are probably few among the thousands who enjoy its music who ever gave a thought to the real meaning of the name, which signifies in Italian *piano*, soft, and *forte*, strong; and it is stated that the name was suggested by one Schroter (who claimed to have invented the arrangement of keys, springs, and hammers) by his writing to a friend that with his new instrument one could play at pleasure either forte or piano. Another claimant for the honor of having made the first piano-forte was a French musical instrument maker named Marius; and still another, who antedates the others, was Christofali, of Padua, who, it is claimed, made the first piano-forte in 1711.

Messrs. Broadwood, of London, have in their possession a piano-forte that was used at a concert at the Covent Garden Theater in 1767, and announced as a "new instrument," so the extent of piano making was not vast in the first fifty years of its practice. Early in the present century piano-fortes were imported to this country from England where great attention was given to their manufacture; but about 1825 the importation of these instruments declined as the manufacture of American pianos advanced, and the date of the prosperity of the American instruments may be traced to the year (1825) when Alpheus Babcock, of Phildelphia, patented the first cast-iron plate to which the string pins are attached—the most important improvement of all the many



THE HARPSICHORD.

that have marked the growth of this æsthetic industry in the United States. The development of this as well as so many other American manufactures has been marvelous, and American pianos are now sent to every part of the civilized world. I have the authority of Mr. Napoleon J. Haines, Jr., of New York, who is one of the prominent American piano makers, for saying that



GRAND PIANO.

there is imminent prospect that the European and other foreign demand for American pianos will increase the manufacture of pianos in this country to such a degree as almost to revolutionize the relative relations of the United States and other countries.

In 1851 there was a tendency to revive the more ornate cases for pianos made in England, an example of that style being shown in the piano made by Collard & Collard, of London, for the International Exhibition of the year named. To-day the taste is altogether for simplicity in the construction of cases, although the remarkable beauty of some of our American woods is seen to the highest advantage in the large surfaces which they present. Capt. Annesley, of London, a connoisseur of musical instruments as well as of music, writes to Messrs. Haines Brothers, the American piano-forte makers, under a recent date: "The upright piano-forte selected at your ware-rooms arrived safely at my home. Since then several of our great men here have played upon it, and they indorse in each case my own conscientious opinion, namely, that it is a magnificent specimen of work, grand tone and exquisite touch, that can not be surpassed by any English specimen at any price."

This is strong praise coming from an English pen; but it is only what we hear of very many American manufactures that have de-

UPRIGHT PIANO.

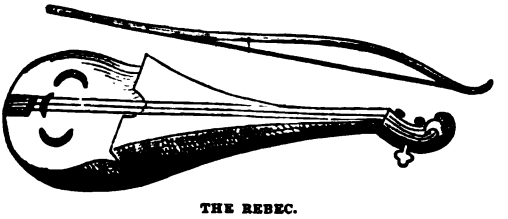
veloped so wonderfully within the last decade of years. The amount of money expended in the manufacture of pianos during the current year will probably exceed twelve millions of dollars, and the industry employs many thousands of skilled workmen. That the public taste is vastly improved by this means of diffusing music can not be doubted, and the refining influence which the mighty cabinet of pent-up sound exercises is felt in every home where "piano" is a familiar word. It is a credit to our people that so much time and money is devoted to the cultivation of music and the vast sums annually spent in the manufacture of musical sounds indicates something of the spirit of devotion that builds temples and places shrines, an enthusiastic regard for music that is felt by artists and amateurs alike.

WOMAN PLAYING THE HARP.

The most noticeable change in piano making in New York is the change in "fashion" from square to upright pianos, a change largely due to the many improvements made in the construction of the latter form by Mr. Haines. The illustration which we give of a Haines upright piano shows that the style is far plainer than most of the pianos made ten or fifteen years ago, marking an improved taste in that regard; but within, the unseen beauties which pianos of that day lacked, the power to produce the rare volume of sound and wonderful *singing*

THE ASSYRIAN DULCIMER.

quality that belongs to these instruments, entitle them without question to represent the culmination of musical instrument-making of civilized man.



THE REBEC.

WEST POINT MILITARY ACADEMY.

SECOND PAPER.

THE SUMMER ENCAMPMENT.

IN a former article we gave some account of the history of the military academy at West Point. In the present number we propose to speak of its internal economy and arrangement. We shall first mention the

ACADEMIC STAFF.

Several members of the academic staff are of national and even international reputation. Major-general John M. Schofield, the superintendent, is the son of a Baptist and the grandson of a Methodist minister. Born November 29, 1831, in Chautauqua County, New York, he graduated at the Military Academy July 1, 1853, in the same class with M'Pherson and Sheridan; was assigned to duty as assistant professor of philosophy November, 1855; elected to the chair of physics in Washington University, St. Louis, August, 1860; entered on active duty at the outbreak of the rebellion, April 20, 1861; fought and won the battle of Fredericktown, October 21st; organized the Army of the Frontier September, 1862; appointed major-general of volunteers November 29, 1862; commanded the Department of Missouri, and after January 1, 1864, the Department and Army of the Ohio; was associated with General Sherman in the campaign that closed at Atlanta; worsted his rebel class-mate, Hood, at Franklin; captured Fort Anderson, Wilmington, in February, 1865; executed the military convention of capitulation between Generals Sherman and Joseph Johnston; acted as secretary of war in President Johnson's cabinet after June 1, 1868; appointed major-general of the United States army on President Grant's inauguration, and on September 1, 1876, was elevated to his present position. His career has been remarkably brilliant, and is the sturdy outgoing of symmetrical moral and physical forces under exceptionally favoring conditions. His military staff includes Captain Wherry and Lieutenants Wood and Schofield, besides the officers before named.

Of the academic staff Professor H. L. Kendrick, LL. D., was born in New Hampshire, graduated at West Point in 1835, served as assistant professor of chemistry, brevetted major for gallant services in Mexico, appointed to the chair of chemistry, mineralogy, and geology, March 3, 1857. His instructions cultivate the observant and reasoning, as well as the mnemonic powers, of his classes, and that in style so winning and paternal as to command the reverent love of all the members. Lieutenants Tillman, Wisser, Oyster, and Springett are his assistants, and impress visitors—Lieutenant Tillman particularly, by the clear, compact, patient, and helpful manner in which their educational work is done. Professor Patrice de Janon is the head of the department of Spanish, is a native of South America, was sword-master from 1846 to 1857, professor of the Spanish language from 1857 to 1863, and again from 1863 to the present. None of the cadets study Spanish now, but some expect to do so next year. The Board of Visitors last year seemed to doubt the necessity of reviving this special study, and inclined to substitute that of German in its stead. Colonel H. M. Lazelle, commandant of cadets and instructor of artillery, cavalry, and infantry tactics, was born in Massachusetts, graduated at West Point in 1855, served against the Gila and Muscalero Apaches, did excellent service against the rebellion as agent for the exchange of prisoners in the West, and as colonel of the 10th New York Cavalry. He was appointed to his present position July 1, 1879, and is assisted by Major A. Piper, Captain E. S. Godfrey, and Lieutenants L. H. Walker, W. H. Coffin, and E. J. M'Clernand.

Department of Natural and Experimental Philosophy: Professor Peter S. Michie, Ph. D. Born in Scotland, graduated at West Point, 1863, served as engineer in the civil war, and was chief engineer of the Army of the James and Department of Virginia when General R. E. Lee capitulated at Appomattox Court House. From April 1866 to April 1867 he was engaged in inspecting the ordnance and fortifications of the leading military nations of Europe, and entered upon his present duties February 14, 1871. Lieutenants C. B. Sears, G. S. Anderson, and G. H. Bacon are his assistants. To the comprehension of the many difficult and abstruse problems in this department students

MAJOR-GENERAL JOHN M. SCHOFIELD.

are assisted by luminous explanations given at their own request.

Department of the French Language and English Studies: Professor George L. Andrews. Born in Massachusetts, graduated from the State Normal School in 1846, and from West Point at the head of his class. Assistant professor of civil and military engineering at the Military Academy from August, 1854, to September, 1855, when he entered civil life. Commissioned lieutenant-colonel of the 2d Massachusetts Volunteers in May, 1861, Brigadier-general on November 9, 1862, and rendered invaluable service in the Department of the Gulf as chief of staff to General Banks, whose enterprises were all prosperous while General Andrews retained that position. After the capture of Port Hudson he organized and commanded the Corps d'Afrique. Brevetted major-general March 20, 1865, and appointed professor February 28, 1871. His assistants are Lieutenants O. B. Mitcham, J. Bigelow, J. H. Philbrick, T. H. Bliss, and J. R. Williams.

Department of History, Geography, and

Ethics: Professor John Forsyth, D. D., LL. D. Lieutenant R. A. Ives is assistant professor of ethics.

Department of Civil and Military Engineering: Professor Junius B. Wheeler. As-

MAJOR-GENERAL GEORGE L. ANDREWS.

sistants, Lieutenants Rossell, Kingman, and Young — the latter a son of Brigham Young. Dry and technical as the science of geometry is to minds naturally averse to it, they yet acquire familiar acquaintance therewith under the suggestive and thorough teaching here given. The explanation of the principles of construction of such a work as the Niagara Suspension Bridge, when given by an intelligent cadet is interesting as a popular lecture. Professor Wheeler was born in North Carolina, graduated in 1855, served in the academy and in the field throughout the rebellion; was brevetted lieutenant-colonel for gallant and meritorious conduct, and succeeded Professor Mahan in his present post in September, 1871.

Department of Drawing: Professor C. W. Larned. He is the successor of Professor Robert W. Weir, whose "Embarkation of the Pilgrims" in the rotunda of the capitol at Washington is the finest of the eight pictures that adorn it. Professor Larned was born in New York, graduated (West Point) in 1870, served on the Yellowstone River and other parts of the frontier, and received his present appointment July 25, 1876. Lieutenants A. Reed, C. A. Worden, and T. G. Townsend, assistants. Utility rather than beauty is the end desiderated and compassed in this department.

Department of Mathematics: Professor E. W. Bass. Born in Wisconsin, graduated at West Point in 1868, assistant professor of philosophy from 1869 to 1874, assistant astronomer of the United States expedition to New Zealand to observe the transit of Venus in 1874–5, assistant professor of philosophy from September, 1876, to April, 1878, when he was appointed to the chair formerly filled by Professor Church. Lieutenants Knight, Bergland, Blunt, Bailey, Steever, Honeycutt, Crozier, and Ludlow, assistants.

Department of Law: Professor G. N. Lieber, son of Dr. Francis Lieber, the erudite author of "Civil Liberty," and other profoundly able treatises. Born in South Carolina, educated for the bar, commissioned first lieutenant of 11th infantry in 1861, major November 13, 1862—from which date until February 25, 1867, he performed onerous and effective labor as judge-advocate; appointed professor of law August 28, 1878. Lieutenant R. A. Ives, assistant. The history, principles, and characteristics of the three branches of legal jurisprudence here studied are fully outlined and explained, and ample references furnished to aid in pursuance of further studies. Whatever Kent and Story do not supply in order to a full understanding of the American system of civil polity is provided by dictation of Professor Lieber. Whether he is ever called upon to act as judge-advocate at West Point does not appear. Professor Church, when assistant in the mathematical department, was often detailed as judge-advocate in courts-martial, and on such occasions officiated in the interests both of the government and the prisoner. A lawyer who has charge of complaint and defense too is sure to win his case. One of Church's celebrated suits was for and against a German soldier, accused of stealing one of Mr. Cozzens's pigs. The evidence was circumstantial. A fellow-

soldier swore that he had seen half a dressed pig in the prisoner's quarters. The prisoner was then asked if he had any questions for the witness. "Yes, sir," he replied. "I want to ask him one question. He is de very man who helped me take de pig out of de pen." There the judge-advocate rested his case. The prisoner was found guilty and punished.

Department of Ordnance and Gunnery: Major A. Mordecai, instructor, assisted by Lieutenants Blunt and Rockwell. Major Mordecai was born in Pennsylvania, graduated in 1861 at West Point; entered the corps of topographical engineers, 1861; assistant professor of mathematics from September, 1861, to June, 1862; chief of ordnance from September, 1863, to April, 1864; brevetted lieutenant-colonel March, 1865, for distinguished services during the rebellion; appointed instructor at the Military Academy in 1865, and served until 1869; reappointed to his present position in September, 1874. He is a thorough educator, and will doubtless publish in due time the best text-b ok on ordnance and gunnery.

Department of Practical Military Engineering: Captain C. W. Raymond, Ph. D., instructor, assisted by Lieutenants Reed and Taber. Captain Raymond was born in Connecticut, graduated in 1865, commissioned 1st lieutenant corps of engineers in 1865, captain in 1867, and did admirable work on the fortifications in the vicinity of Boston and San Francisco.

None of the academic staff, except the professors, hold office permanently. They are relieved from duty and ordered to rejoin their respective regiments after about four years' service. The modern idea of rotation in office dictates these constant changes, and the best interests of the institution suffer thereby. Efficiency and good behavior, as in ordinary colleges, should determine the tenure of office. Lieutenants ought to remain until promoted to captaincies. Greater enthusiasm and devotion to educational work would be the probable result. As it is they are tempted to regard residence at West Point as desirable chiefly because it affords opportunities for purely professional improvement, and maintain a vigorous association for that purpose.

The cadets are divided into four classes, corresponding to the four years of pupilage. The classes are subdivided into sections, and the best scholars put into the first section. Those in the lower sections are dubbed "Immortals" by more able or industrious students, and often fail to graduate. The sections are regularly visited by the professors and heads of departments to ascertain the scholastic merits of the members and the educational abilities of the teachers. The more difficult subjects and investigations are ordinarily confined to the higher sections, regard being had to the capacity of the students. Some are naturally qualified to excel in one department of study while naturally deficient in aptitude for others. Only men of the highest grades of intellect achieve masterly proficiency in all. Transfers from section to section are made on recorded merits or demerits, and consolidated reports of progress are forwarded monthly to the War Department, and extracts from the same to the parent or guardian of each cadet.

Instruction in infantry tactics begins during the Summer encampment. The fourth class is then introduced to the school of the soldier, and progresses as far into the schools of the company and battalion as time will permit. The manner of making out quartermaster's, subsistence, and company papers is also taught. Practical instruction in artillery and cavalry tactics then follows; also in the use of the sword, bayonet, military gymnastics, etc., as the superintendent may direct. Instruction in ordnance, gunnery, and laboratory duty, in practical military engineering, military reconnaisance, bridge exercise, signaling and telegraphy, civil engineering, and science of war is mainly deferred until the closing half of the course. An annual examination is held in June in presence of the Board of Visitors; and also a semi-annual examination in January, after which the standing of each student is decided by vote, and the names of those found deficient in studies or discipline reported to the War Department for discharge. Merit rolls, indicating the rank of each cadet in

the several studies and in discipline, are drawn up in January and June, and are accessible to the entire corps. Offenses against discipline are divided into seven classes, and are punished by demerits ranging from one to ten. Provision is made in case of good conduct for reduction of the number recorded; but if it exceed one hundred in six months the subject is declared deficient in discipline. No man can make a good commander who has not first learned how to obey. Implicit and thorough obedience is a cardinal military virtue.

How any of the cadets pass through a whole year, much more the entire course, without demerits is a perfect marvel in view of the daily report of delinquencies. Here are sundry excerpts therefrom, as exhibited in the guard-house: "Wash-basin on lower shelf of wash-stand dirty, 8.30 and 9 A. M." "Explanation wrongly dated." "Cap on side of head." "Gazing about in ranks." "Talking in ranks." "Spilling water on table-cloth at dinner." "Using profane expression 7.50 and 8 A. M." "Upper lip not properly shaved." "Late at parade." "Coat unbuttoned in hall of barracks." "Submitting argumentative explanation." A bad fault, the last. West Point is a school for soldiers, not for lawyers; for doers, not for talkers.

Next day one is reported for "Odor of tobacco smoke in quarters, 8.40 and 9 P. M." Others for "dress-coat on bed;" "sitting on railing around firing-stand;" "bedding not all piled at inspection of barracks, 6.15 A. M.;" "shoes not properly blacked;" "chair out of place;" "late at breakfast;" "facing detachment in wrong direction at artillery drill;" "not executing right-wheel properly;" "shoes untied;" "strings of drawers protruding beneath pants;" "buttons off;" "wash-bowl not inverted at police inspection," and so on *ad infinitum*.

Among the academical delinquencies, one mischievous wight is reported for "unquietness and making unnecessary noise by rattling buttons against back of seat in mathematical section-room;" others for "attempting to obtain assistance; to give assistance; failing to resume seat promptly; abruptly interrupting another cadet's recitation." Grievous

EVENING GUN.

affront was offered by an impertinent fellow who, when asked by his preceptor for a definition of nonsense, replied, "Put your finger in a bucket of water and then look for the hole." He was deemed too wise and witty for West Point, and went home after the ensuing examination.

Explanation of the circumstances of an offense may be submitted with a view to excuse from punishment; but such explanation must be brief and pertinent. It is frequently amusingly laconic. One youthful warrior was reported for laughing in ranks at dress parade. It had so happened that he had seen a young lady jump in terror when the evening gun was fired. His explanation ran as follows: "Gun fired; gal jumped; I laughed because I could n't help it." Another was accused of making frightful facial contortions on parade. His excuse was "Fly on phiz." He was excused; and so was the comrade who shook his head as wildly as though he had St. Vitus's dance, and who explained his uncouth wriggling by the words, "Bug in ear." Verbosity is at a discount in the Military Academy.

The pay of a cadet is five hundred and forty dollars a year—quite enough to support him if economically used. Four dollars a month are reserved by the treasurer for the purchase of uniform and equipments at the time of promotion. No cadet is supposed to have any spending money, but may purchase articles on credit, which articles are charged in a book that each keeps for that purpose, and which is the treasurer's voucher for sums paid by him in liquidation of debt.

Cadets, in attendance at the Academy, are permitted at the end of the second year to pass the period of the Summer encampment on furlough; and in case their homes are not too distant are occasionally allowed leave of absence for the Christmas holidays. Their uniform is of gray cloth, coat single-breasted, pants of gray cloth, with a black stripe one inch wide down the outer seam, cap of ordinary military pattern, overcoat of gray kersey, and fatigue dress of white drilling; the latter is always spotless. One gay young fellow rejoiced in the ownership of sixty-four pairs of white pants; his room-mate pined in possession of only thirty-six. Whiskers and mustache are prohibited. "Bearded like the pard," does not apply for months after graduation. When absent on leave they may don citizen's clothing if so disposed. Professors may wear the uniform of their rank in the army, or a citizen's blue cloth coat with buttons of the general staff,

DREAM OF FURLOUGH.

black dress hat, pantaloons and dress plain, white or dark-blue in color, at their option.

The discipline of the Military Academy is that of the army. Punishments include privation of recreation, extra duty, reprimand, arrest, reduction in rank, and confinement to the room, tent, light prison, and dark prison. Both prisons are ordinary rooms—the latter unlighted. Stories are in circulation of adventurous scapegraces who nocturnally liberated themselves from incarceration, and then roamed around the neighborhood until day-dawn warned them to return, like Hamlet's ghost, to their irksome prison. One famous general, whose name is a "household word," is said to have been confined for three months, and at the end of that term to have seriously thanked the superintendent for his judicious severity, inasmuch as it had severed the culprit from his evil associates, compelled him to reflect on his ways, and enabled him to mature most virtuous resolutions as to the future. Still he feared that reformation was not quite perfected, and begged, as a personal favor, that the superintendent would remit him to durance vile until he should be confirmed. The petition was granted, but the wise official caused the prisoner's quarters to be inspected some two or three nights thereafter. The cage was there, but the bird was not. He was singing, but not in nightingale strains, at "Benny Havens, O!" whither he had been wont to resort nightly during the whole of his previous detention. It is needless to add that that was his last song in Benny's luxurious bower. Thenceforward he was kept out of prison hard at work, and in due course graduated with honor. Suspension and dismission are other forms of penalty.

BENNY HAVENS.

Cadets are not allowed to drink intoxicating liquors, nor to have them in possession under pain of dismissal. Neither are they permitted to play cards or games of chance, nor to have the instruments of gambling in their possession within cadet limits. Falsehood, fraud, challenging to or fighting a duel, are punished by dismission from the service. Crimes of the latter class are exceedingly rare. James H. Perry, afterwards an accomplished clergyman, was stabbed by a bellicose Southerner with whom he refused to fight, and retaliated by striking him over the head and face with a musket so severely that the challenger never fully recovered from the effects of the blow. Major Fowle, when commandant of cadets, is said to have received a challenge from a Southern cadet, who fancied himself to be aggrieved, and who sent the hostile missive by the hand of a fellow fire-eater. Both were liable to arrest, court martial, and punishment. But the commandant did not pursue military routine on that momentous occasion. He read the message, threw it into the

fire, coolly wrapped up a piece of loaf-sugar in paper, and sent it by bearer to the wrathful Achilles, with the remark that "petulant children were often soothed by candy." Secession was squelched on the spot.

Attempted redress of official wrongs, defamation of character, insult, oppression, combinations against authority, profanation of the Lord's day, and all conduct unbecoming an officer and a gentleman are prohibited and severely punished. The barbarous practice of bazing has received its death blow from the judicious action and forceful hand of General Schofield. Offenses of course occur. Human nature is hot-blooded and often reckless of consequences at the cadet age; but in no college in the land is there more of subordination, sobriety, and good order than in the United States Military Academy at West Point.

Officers are recommended—but do not always act on the recommendation—to attend "divine service" on Sundays. Cadets are required to attend, unless insuperable religious scruples stand in the way. The great majority worship in the chapel; a small minority attend the Roman Catholic, Episcopalian, Presbyterian, and Methodist Churches. Every rule that collated experiences in educational institutions suggest for the formation of manly character is incorporated with the governing regulations.

Reveillé in camp is at 5 A. M., and at 6 A. M. in barracks; breakfast at 6 A. M. in camp, and in barracks at 6.30; dinner at 1 P. M.; supper after evening parade, and never earlier than 5.30 P. M. Tattoo is at 9.30, and taps, the signal to extinguish lights, at 10 P. M. The intervals between these hours are filled up with study, recitation, military exercise, and recreation—the latter bearing the relation to the former of Falstaff's piece of bread to his "enormous deal of sack."

The most commanding and impressive structure at West Point is the cadets' barracks. It cost one hundred and eighty-six thousand dollars, is castellated, and corniced with red sandstone in the Elizabethan style, and is three hundred and sixty by sixty feet in size, with a wing one hundred by sixty feet in the rear of the west tower. Built of granite, it contains one hundred and seventy-six rooms, of which one hundred and thirty-six, each fourteen by twenty-two feet, are tenanted by cadets—two or three in a room. Those in the west tower, with others, are used as officers' quarters. In the basement are several bath-rooms, hot-water apparatus for heating the building, and quarters for employés. The large hall over the sally-port is appropriated to the Dialectic Society. Every room contains iron bedsteads, one for each occupant, furnished with mattress, blankets, sheets, quilt, pillow, etc.; also with mantel-piece, shelves, and other fixtures; table, chairs, washstand, pails, broom, looking-glass, and other conveniences. Maps and pictures are forbidden. In the morning, after reveillé roll-call, the cadet must sweep the dirt from his room into the hall, and dust his furniture. Noise, scuffling, and unseemly exhibitions are prohibited, and effective means adopted to enforce the regulations.

Near the center of the barracks, on the lower floor, is the dentist's office. Wellington is said to have given his soldiers time to consume the best dinner he could supply before leading them into battle. Uncle Sam approves of that policy, and, like John Bull, always fights best with a full stomach. But he also believes in good teeth, and if his boys at the Military Academy are faulty in that respect, is careful to provide them with the best incisors and masticators possible, under the hand of Dr. Saunders, one of his jolliest and most skillful operators.

Near the west wing of the barracks is the commissary building, in which the shoes and uniforms of the cadets are manufactured, in whole or in part, and where sundry supplies are dispensed. Thence, walking northwardly along the sidewalk, or under the verdant canopy of beautiful trees, the visitor passes the residences of officers, professors, and superintendent, until he reaches the cemetery, where rest the mortal remains of Scott, Hartsuff, Custer, and many a soldier of humbler fame, until the archangel's trumpet shall sound the reveillé to the general resurrection.

"The boast of heraldry, the pomp of power,
And all that beauty, all that wealth e'er gave,
Await alike the inevitable hour;
The paths of glory lead but to the grave.

"Hark! how the sacred calm that breathes around,
Bids every fierce, tumultuous passion cease,
In still small accents whispering from the ground,
A grateful earnest of eternal peace."

Retracing the path already trodden, the group of cottages on the left, near the margin of the river, arrest the eye. They constitute what is locally known as Logtown, and are the quarters of the married soldiers. Rugertown, another group of cottages, is

SEA-COAST BATTERY.

beyond the iron gates to the west. Still farther to the east is Camptown, which includes the cavalry, the artillery, the engineer, and the band barracks; the powder magazine, hospital for soldiers, guard-houses, store-houses, workshops, residence of civil service employés, and the soldiers' church, which is utilized by the Roman Catholics in the morning and by the Methodist Episcopalians in the afternoon. The services of the latter are held in connection with the Sunday-school, in which the most indefatigable and influential teacher is "Mother Stewart," the *alumni* of whose Bible-class are scattered over every part of the Union, and who cherish many pleasant reminiscences of "The little Brown House just under the hill."

Next comes the post-office, kept by Miss Blanche Berard, daughter of a former professor of French, and a gifted lady, widely known to the folk of the literary guild. A few yards to the north-east of the post-office is the restaurant, whose tenants, the Dentons, well know how to sustain their fairly won reputation as the Delmonicos of West Point, and the purveyors of luxurious supplies to residents and visitors. Behind the restaurant are the livery stables, of which other Dentons are proprietors, and which provide transportation to any part of the grounds, or of the unsurpassably picturesque region round about. Quite as near is the Ordnance Laboratory, where the cadets are initiated into all the mysteries proper to the manufacture of explosives, projectiles, etc. The road between the two leads down to the Sea Coast Battery and the North Landing. Near its terminus is one entrance to Flirtation Walk, which, on the way to Gee's Point, receives another division of the same promenade that begins near the West Point hotel, and continues thence to the light-house on Gee's Point, to Battery Knox, Kosciuszko's Garden, and the Summer encampment of the cadets.

Flirtation Walk enjoys unique renown. Under the umbrageous archway formed by trees, through whose branches the sun sifts in bewitching playfulness, the romantic Neophyte of Mars is wont to saunter in company with his "Four o'clock," or, in other words, the young lady who may have captured his vagrant fancy at hops in the West Hall, or at interviews on the plain. Acquaintances formed at West Point not unfrequently culminate in matrimony. In such cases the following verses, said to have been written in 1879 and to have been committed to memory by many cadets, are faithfully descriptive of both parties:

"O mon cadet, mon joli cadet!
With his pretty gold buttons and rollicking way,
With his smiles for the ladies, his stories for beaux,
The pet of the ladies wherever he goes,
Swaggering, swinging, hurrying fast,
No thought of the future, no thought of the past,
Carelessly happy—mon beau debonair;
O, que je l'aime, mon beau militaire!

O, mon cadet, mon joli cadet!
Straight as an arrow, lithe as a fay,
Fickle as fortune, inconstant as chance,
Light as a fairy when leading the dance,

Sliding, gliding, whirling we go,
Murm'ring sweet nothings so softly and low,
Carelessly graceful—mon beau debonair;
O, que je t'aime, mon beau militaire!

O mon cadet, mon joli cadet!
Now silent and thoughtful, now joyous and gay,
Never dull, never harsh, never stupidly good,
With his laughing eyes saying, 'I would if I could.'
Whispering, caressing, kissing me, too,
In spite of my anger; for what can I do?
He's so strong and so earnest, and then—I do n't care;
O, que je t'aime, my beau militaire!

O, mon cadet, mon joli cadet!
How I will weep when he goes far away
Out on the plains, 'midst danger and strife,
When all I can do is to pray for his life,
Watching, weeping, waiting the day
That shall bring him again, no more mon cadet,
But my soldier, my lover, my joy, and my care,
Que je t'adore, my brave militaire!"

The Summer encampment of the cadets lasts from the June examination to the end of August, and is the season of fashion and gayety at West Point. Thither flock the relatives and friends of the students, and thither troop the multitudes who pay such willing devotion at the shrine of Terpsichore. This, too, is the season when the wit and humor of the cadet, less burdened by science and *technique* than at other times, is apt to effloresce. It seldom reaches flavorous fruitage. Mars has little in common with Apollo and the Muses. The cadet, however, when questioned why the cannon at the corners of the different streets are planted muzzle down and trunnion deep, is likely to return the seriocomic reply: "That is in case of war with China." Or, he will exercise his punning genius on a raw young "plebe" of spindling extremities by insisting that he ought to be arrested for vagrancy because he has no visible means of support, and then consoling the mortified greenhorn by bidding him "take courage, and by and by, you will be able to cast a shadow." Badinage of the latter kind may well pass unrebuked; but the grossly insulting language often used to new-comers is as much in discord with the best traditions of the institution as it is with true manliness and Christian chivalry. The West Point Scrap Book* is a curious repertory of the fun and frolic and jokes of the Academy.

Near the end of Flirtation Walk is Dade's Monument. Close by the Summer encampment is Fort Clinton, once Fort Arnold, now in perfect repair, and enriched interiorly by the burst and fractured remnants of many

FLIRTATION WALK.

pieces of ordnance, and by the monument to Kosciuszko, the patriot hero of Poland, at its north-east angle. Thence, returning westwardly, the West Point hotel is reached or passed, and the walk continued to the Siege and Mortar Battery and to Trophy Point, where are collected sundry Mexican guns bearing the significant inscription

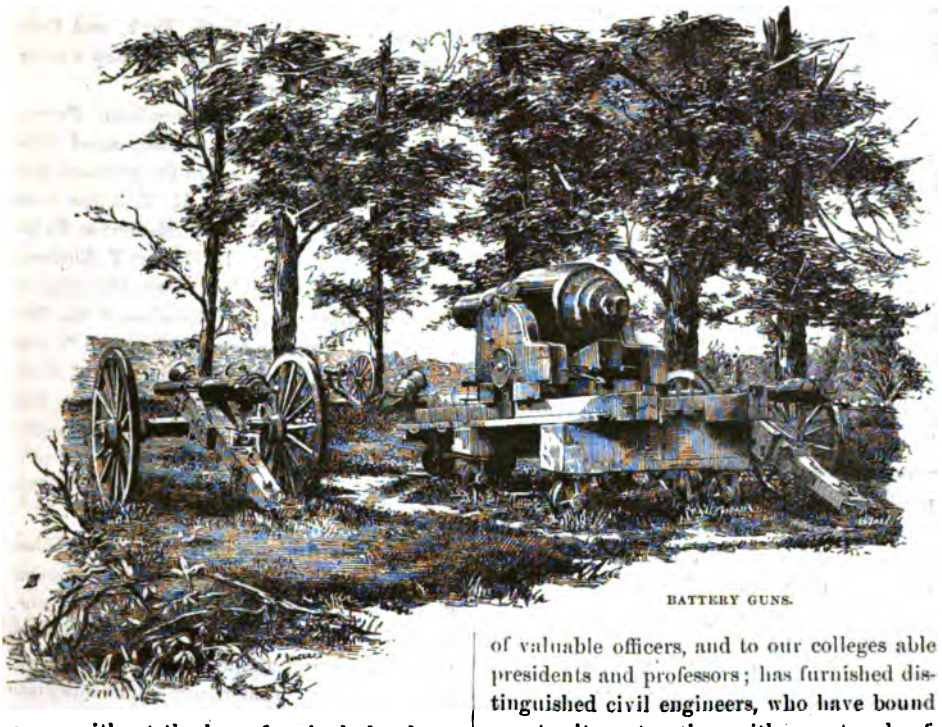
*Van Nostrand: New York.

"*Ultima Ratio Regum*," and also a monster cannon presented by Sir William Armstrong & Co. to the Confederate Government, and captured by the Union forces. A few yards farther on is the monument of General Sedgwick, who, with head uncovered, stands permanently at "parade-rest," as if reviewing the battalion evolutions or evening dress parade in progress upon the plain. The plain itself is about a mile in circumference. Excellent photographs of West Point, its buildings, scenes, and monuments, together with portraits of the officers, are multiplied at the studio of the Messrs. Pach, behind the south end of the Academy Building.

NATIONAL VALUE OF THE MILITARY ACADEMY.

Cui bono? To what good is the whole—the teaching, the drilling, the pomp, and circumstance of mimic war? We answer. The production of a body of thoroughly educated and disciplined officers, who shall be prepared to organize and command the regular army, and also the national militia, and volunteer forces, in case of domestic insurrection or foreign war; and who, if in civil life, will be invaluably efficient in developing the resources of the nation, and assisting its progress to the highest attainable point of prosperity and power. West Point has repeatedly rendered this service to the republic. General Schofield, at the beginning of the rebellion, drilled the officers of loyal voluntary regiments, who in turn drilled their men, and thus helped to create the excellent and soldierly "Army of the Frontier" in an incredibly short space of time. General Andrews did the same thing in Massachusetts. The organizing and disciplinary power of each of these distinguished officers was invaluable to the nation at the crisis of its troubles. While sin remains in the hearts and lives of men, "wars and fightings" are sure to arise among them. One party, if not both, may be in the wrong. Again, one party, as in the late civil war, may be wholly in the right. But that right may have might, and that might may conquer, and through conquest win peace, it is essentially necessary that the forces of law and equity should have competent commanders. "Heaven-born generals" are scarce as Jeannes d' Arc. "It is mind, disciplined, and instructed, which leads armies and builds up empires; mind, not stultified with pedantry, but developed by thought and inward will, conferring the power of discerning, analyzing, and combining means essential to an end," that should come to the front in all national emergencies. "The knowledge of grand tactics," said Napoleon, "is acquired only by experience and the study of the history of the campaigns of all the great captains. Gustavus Adolphus, Turenne, Frederick, like Alexander, Hannibal, and Cæsar, have all acted on the same principles of holding their forces united, being nowhere invulnerable, and throwing their masses upon important points; such are the principles which assure victory." In the historical and military studies of General Grant, while a citizen of Galena, Illinois, studies into which he had been initiated at West Point, lie some of the principal secrets of his marvelous success. The Emperor Napoleon, at Chiselhurst, affirmed that the French were defeated because they fought under an obsolescent system of military tactics and precedents; while the German commanders rightfully accepted modern war rather as a system of engineering, the ultimate end of which was to concentrate on territory, previously studied with the utmost care, all the resources of the railroad and the telegraph, equally with those of the breech-loading rifle and improved ordnance.

Genius, knowledge, and experience make great generals. Alexander, Cæsar, and Napoleon were students and great scholars. "To Steuben, the disciple of the great Frederick, the Continental army was mainly indebted for its discipline." "I give it as my fixed opinion," wrote General Scott, "that but for our graduated cadets, the war between the United States and Mexico might and probably would have lasted some four and five years, with, in its first half, more defeats than victories falling to our share; whereas, in less than two campaigns, we have conquered a great country and a



BATTERY GUNS.

peace without the loss of a single battle or skirmish."

The Army Register of 1866 shows that of the seventeen general officers of the regular army at the close of the rebellion, all except General Terry were graduates of West Point, and his fame was chiefly due to one splendid victory, achieved by the headlong but disciplined valor of his troops.

"'This admirable institution," say General Cullum, "has supplied the nation with over two thousand two hundred accomplished officers, of which any army might well be proud; has filled every arm of the service with talent, efficiency, and integrity; has materially aided in successfully conducting three great wars, extending our national domain, and preserving the union; has perpetually pushed the wild savage from our borders, and been the pioneer of advancing civilization; has constructed and armed our fortifications, improved our harbors, lakes, and rivers, defined our boundaries, surveyed and lighted our coasts, and explored the length and breadth of our land; has given to our militia and volunteers large numbers of valuable officers, and to our colleges able presidents and professors; has furnished distinguished civil engineers, who have bound our territory together with a network of railways and canals; has supplied valuable city, State, and government functionaries; has improved our workshops and the culture of the soil; has added its mite to the counting-house, the bar, and the pulpit, and, through the contributions and text-books of its graduates, has greatly elevated the scientific standard of most of the educational institutions throughout our country, and even extended its influence abroad."

Prior to 1868 over one thousand three hundred graduates had entered civil life. One hundred and twenty-nine had become lawyers, ten of them judges, fifteen clergymen, nine physicians, fifteen editors, twenty-six presidents of colleges, twenty-three principals of academies and teachers, eighty-five professors, thirty-five presidents of railroads, one hundred and fifty-five civil engineers, seventy-eight merchants, thirty manufacturers, one hundred and sixty-one planters and farmers, etc. One became President of the United States, twelve members of the national Senate and House of Representatives, seven ministers to foreign

courts, sixty-six members of State legislatures, and thirty-four State officers of various grades.

Of the graduates known to have been ordained to the Christian ministry eleven were Protestant Episcopalians, five Methodist Episcopalians, three Roman Catholics, and one Presbyterian. The latter was one of the most heroic evangelists and useful missionaries of the nineteenth century. Dedicated to the work of foreign missions by his saintly mother, he was physically fitted for it by the superb development obtained under West Point discipline. He graduated in 1839 in the same class with Generals Halleck, Thomas, Picketts, Ord, and Canby, and was subsequently assistant professor of mathematics in the Academy. In 1844 he went out as one of the first ordained missionaries of his Church to China, and was stationed at Ningpo. The crowning work of his life was the translation of the Bible into Chinese, which necessitated removal to Shanghai, where he was living when it was besieged by Taeping rebels. Their proximity to the isolated American settlement impelled him to assume the duties of military commander, which he discharged in such masterly manner as to draw from the Hon. Anson Burlingame, the American minister to China, the remark: "If you were at home, you might be a major-general."

"No doubt," he replied, "I might. Men I drilled are in that position. Among these are Generals Sherman, Van Vliet, Tower, Thomas, Newton, and Rosecrans. But," he added earnestly, "I would not change places with one of them. I consider that there is no post of influence on earth equal to that of the man who is permitted to preach the Gospel to four hundred millions of his fellow men."

He died of Asiatic cholera, August 25, 1862, universally beloved and lamented.

Of the Roman Catholics, one only became eminent. He, the Rev. James Clark, was President of Gonzaga College, Washington, D. C., in 1873.

Of the Protestant Episcopalians, one, the Rev. Leonidas Polk, was elevated to the episcopate, and was killed while major-general in the rebel army. Of Drs. Woodbridge, Vinton, Pendleton, Park, and Parsons, the memory is precious to many within and without their communion.

Of the Methodist Episcopalians, Perry, although he did not graduate, stood like Saul among his brethren in the ranks of the itinerant ministry. Dr. R. T. Allen was an eminent educator in the Methodist Episcopal Church South. Dr. Albert T. Bledsoe, the able metaphysician and erudite author of "A Theodicy; or, Vindication of the Divine Glory," was an honored member of the same body. Watson and Sing united with the parent Church. None who knew the latter will forget the meekness and strength, the modesty and ability, the piety and culture, so harmoniously blended in his godly life.

Nor is the religious and moral condition of the Military Academy one whit inferior at the present epoch to any preceding one. There is probably less of drinking, gambling, profane swearing, and lewdness among the pupils than in any numerically equal collegiate collection of young men in the land. They must be gentlemen externally, or they can not remain there. The average week-night attendance at the prayer-meeting in Dialectic Hall is not less than forty, and has been as high as seventy-five. The average attendance on the Sunday evening prayer-meeting is much higher. Sound conversions to Christ occasionally occur. As manly Christians graduate from this as from any secular institution.

The name of Bledsoe, who was an active adherent of secessionist schemes, suggests the value of the Military Academy in the unequivocal production of a "glorious national spirit . . . with its extensive train of political consequences." Graduates were less infected by the spirit of treason than the members of any other department of the public service. For ten years before the rebellion, the cadets took sides in current political disputes and afterward fought as they argued. When the actual struggle came, out of four ex-presidents of the United States, the only Southerner joined the insurgents. Out of four Southern judges on the

bench of the United States Supreme Court, two remained loyal, one strongly sympathized with the rebels, and the other joined them. The Southern judges of the United States District Courts all sided with the enemies of the Union. Of the Southern United States Senators only one was loyal, and of the members of the House of Representatives only three. Nearly all the agents of the State, Treasury, Interior, and Post-office Departments, in or from the seceding States, espoused their cause. Of those appointed to the army from civil life, nearly one-half, but of West Point officers only a fraction over one-fifth, left the service and joined the rebellion. Taken as a whole, nearly four-fifths of the West Point graduates remained faithful. Half the Southern graduates stood firm by the Stars and Stripes, notwithstanding the political convictions, self-sacrificing enthusiasm, and fervid entreaties of their male and female secessionist friends.

In the battles for the Union, one-fifth of the West Point alumni engaged laid down their lives, more than one-third, probably one-half, were wounded, and the survivors can point with manly pride to the services then valiantly rendered. In his "Biographical Register of the Officers and Graduates of the United States Military Academy," General Cullum simply records of the disloyal that they "joined in the rebellion of 1861–66 against the United States," and gives date and place of death where known. In other particulars the record of each is like Arnold's tablet in the Chapel, or the vacant place on the wall once occupied by the portrait of Marino Faliero among the Doges of Venice. While one hundred and sixty-two Southern graduates, including soldiers like the gallant George H. Thomas, were faithful to the Union, sixteen of Northern belongings were guilty of treason and rebellion.

In view of all these unquestionable historic facts, it is not matter of public congratulation that the West Point graduates are not in the majority of those who hold commissions in the army of the United States. In January, 1878, out of the two thousand one hundred and sixty-three officers whose names were inscribed on the Army Register, but 42.1 per cent were *elves* of the Military Academy. Vacancies are more numerous than graduates to fill them. Only 1.7 of every million of the population are annually graduated from West Point. The number ought to be doubled. If it were, still greater advantages would accrue to the country. Competitive examinations yield the best intellectual supply, but afford no guarantee of good moral character. The two, mental and moral excellence, should combine in every candidate.

Such applicants, with the training they are certain to receive, would not only be polished gentlemen, but true patriots whom no sophistry or temptation could beguile into violation of the oath which each is obliged to take upon his admission, nor to break the engagement he voluntarily subscribes before receiving his warrant, and which is in the following form:

"United States Military Academy.

I, —— ——, of the State of ——, aged —— years —— months, having been selected for appointment as a Cadet in the Military Academy of the United States, do hereby engage, with the consent of my (parent or guardian) in the event of my receiving such appointment, that I will serve in the Army of the United States for eight years, unless sooner discharged by competent authority. And I, —— ——, do *solemnly swear* that I will support the Constitution of the United States, and bear true allegiance to the National Government: that I will maintain and defend the sovereignty of the United States, paramount to any and all allegiance, or sovereignty, or fealty I may owe to any State, county, or country whatsoever, and that I will at all times obey the legal orders of my superior officers, and the rules and articles governing the Armies of the United States.

Sworn and subscribed to at —— this —— day of ——, eighteen hundred and ——, before ——."

Repeated references have been made by demagogues to the cost of maintaining the Military Academy. How little force there is in this objection to our grandest national institution is apparent in the light of the

fact that the entire first cost of the grounds and buildings at West Point does not reach the sum of one million three hundred thousand dollars. This is less than the cost of any single first-class brick or granite fortress at the entrance to our numerous rivers, less than the cost of any principal navy-yard, less than the cost of a first-class iron-clad vessel in the navy. The fortress has cost vastly more than its present intrinsic worth; the man-of-war is very uncertain property, which may capsize from collision like the *Grosser Kurfürst*, or founder in a storm like the *Captain*; but the national property at West Point, if thrown upon the market to-day, would sell for more than its original cost. Since the rebellion the average annual cost of educating each cadet has been about one thousand dollars. Thus the annual expenditure in the maintenance of this beneficient institution is not more than three hundred thousand dollars, which is less than the yearly cost of maintaining a first-class iron-clad. This sum, however, includes the pay of the superintendent, professors, and instructors, which can not be equitably included in the estimate, for the reason that, if not stationed at the Academy, they would be on duty elsewhere, and drawing nearly the same salaries. Deducting the aggregate of their pay, the annual cost of the Academy proper is not more than two hundred and fifty thousand dollars, which is about one-fourth the annual cost of a regiment of infantry, and for which a larger proportional number of soldiers, and those of incomparably better character are secured to the country. The total cost of the Military Academy is a little over eleven and a half millions of dollars, not more than twice as much as the city of New York has illegally given to the Roman Catholics within the past eleven years.

In view of the multifold advantages accruing to the nation, this is an exceedingly insignificant amount, even when the cost of educating seceding graduates is embraced. The entire expense of their instruction was more than saved by the military knowledge of the loyal graduates in every day of the rebellion. Losses far exceeding this paltry expenditure in amount would have been inflicted by the blunders of ignorance in ordnance and engineering construction, and in corrupt contracts. The country did not escape all loss from bumptious pretension and fraudulent conspiracy; but it is safe to affirm that the harm was not done by the graduates of the Military Academy. Their integrity is proverbial. Not more than two per cent of the entire number have been cashiered or dismissed from the army, and nearly all of these were guilty only of dissipation and purely military offenses.

The Board of Visitors sent annually to West Point, under national authority and "made up in the main of persons whose professions are not military or naval, and whose tastes, pursuits, and training are altogether civil, and antagonistic to the use of arms," has repeatedly and warmly commended the organization, management, and working of the school, and concluded: "That there is at least one public institution in the United States of which it can be truly affirmed, that the more it is investigated the better it appears, and for the direct administration and control of which no person is believed to have been selected for any other reason than fitness to discharge the trust confided in him." Pure-principled and powerful, the United States Military Academy at West Point is one of the most precious of our national possessions and one of the proudest boasts of our indivisible and immortal Union.

THE WISE MEN OF NORTHUMBRIA.

WITH brooding brow and thoughtful mien they stood
Around their King; silent as Solitude,
Longing for light, yet fearing to admit
Too strong a sun, lest it should quench the torch
Their fathers gave them flaming, and bring down
The gods from their carved shrines to grovel low
With humbled front before the mystic Ark;
And ever and anon Paulinus felt
Their keen but furtive glances search his face
As if to find the Testimony there.
In truth, their rude strength quailed before the might
Of newly proven thews of mind that strove
Aided by weapons that they wot not of.
His deep-sunk eye turned inward upon scenes
Which they divined were visions of a seer;
His stooping form and pale Thought-shadowed face,
Uplifted from a mass of raven hair,
Like the moon peering from the shades of night,
Inspired a reverence they were shy to speak,
And doubted cherishing. An angel, he,
Holding within his hand a little book,
Wherein they could not read. Yet they had heard
From his fine lips the echoes of a Voice
That spake from the blue waves of Galilee,
And 'neath the cool, green plumes of Olivet,
And near the gray keep of the sepulcher,
Witnessing to a life beyond the grave.
And as the night sweeps her dark robe, star-gemmed,
Through the wide halls and circuit of the Heavens,
So did the dark, dark Past, and Future, that
Seemed even more dark and more filled with dread,
Grow glorious and beautiful with joys
Their yearning hearts had not ev'n dimly guessed,
In grove of oak or temple of the gods.
And herein was the lure. It was this Hope
To know the soul's weal in the great Beyond
That drew them to Paulinus' feet, and gave
Them willing ear for the new faith he bore
Triumphant to them as an open scroll,
A flag unfurled, or trumpet, brazen-lipped.
"Speak, little book! strange scroll! speak of the Light
Which can disperse the darkness of men's lives,
And if it flees, then we will welcome thee!
Wave, crimson flag, that tells a victory won
Over the thrall of sin and chain of lusts
That bind man's nobler nature 'neath the base—
Wave in the four pure winds of Heav'n, and if

They do not rend and tear thee in their strength,
Then we will hail thee, and will be content
To take thee for our banner! And blow long
And loud, thou brazen trumpet, and the fall
Of Tyranny from its high throne, the quake
Of sinful consciences, shall be a sign
Whereto we will, for evermore, submit."

On this wise had they spoken, but the sign
From Heav'n had not yet fallen. Now their thoughts
Grew eloquent in silence, till outspoke
An Ealdorman of snowy hair and beard,
The burden of them all, and on this wise:

"O King, how fugitive the Life of Man
Upon this Earth, if nothing may be known
But what our bards can tell us! 'T is as when,
In Winter time, a sparrow to the warmth
Of the hearth-fire lighted in your halls
Flies from the icy rain-storm. By one door
The poor bird enters, but it scarcely lights
Upon such plaisance ere it spreads its wing
To pass out by another, once again,
Into the storm and darkness whence it came,
The blinding rain, the pitiless driving wind,
The pinion-binding, wing-enfolding cold.
Such is the Life of Man! So tarries it
A moment in our sight, but passes away.
Who knows its Hither journey, or its Whence?
Who seeks to know looks out into the night
To find it dark and chill and filled with all
The discords of the raging elements."

"This Gospel is the Harbinger of *Day!*
A beautiful new day!" Paulinus cried,
"'The Night shall pass, the shadows flee away,'
But an immortal Day, eternal noon
Shall be the pure soul's Future. God rolls back
Its curtain to all eyes that yearn to know."

That Day they welcomed, and its light soon broke
On King and court, and even on idol priests,
Who trampled on the false and chose the true,
Making allegiance to the God of Heaven.

And shall not these arise in the white light
Of the great Judgment Throne, there to condemn
Us, who have bat's wings to avoid the Sun,
But love to wanton in the dusk of Doubt?

LIFE AT HIGH PRESSURE.

HOW comes it that so many great men, men that have been great benefactors of their kind, and have left great works behind them, have had to live under pressure, with strained energies, and the sense of having too much to do? It seems as if men could hardly become great under the conditions of a calm, leisurely life. A man can not run at his fastest, or swim his farthest, in ordinary circumstances; he must be running in an exciting race, or swimming for dear life, to do his best. It rarely appears what a man is capable of till he is put to his mettle. Necessity is a wonderful educator, a wonderful enlarger and quickener of men's faculties. We lately read an account of a printing machine which from eight cylinders can print and fold about a hundred thousand newspapers in an hour. What but the pressure of necessity could ever have made machinery accomplish such wonders? It needs something of the same sort to take the most out of human faculties. Under the pressure, the faculties become enlarged and quickened, and are thus capable of producing results that calm leisure never attains.

Still it is true that overwork is an evil. It is more—it is often a murderer. Sir Walter Scott, Sir James Simpson, Dr. Norman Macleod, and many others certainly did not live to the end of their days, and it was overwork that robbed them of the residue. No doubt, as is often said, it is not work but worry that does the mischief. But worry is the daughter of overwork, it is having too little time to be patient that gives the feeling of worry, it is having the nerves so stretched that the slightest opposition frets them. When a celebrated editor complained of being

> "Overworked, overworried,
> Over-Croker'd, over-Murray'd,"

the first word of his lamentation explained all the rest. Undoubtedly, then, overwork, while a means to good, is itself an evil. A distinguished man of our acquaintance used to say that the most desirable condition of life was to have just somewhat more to do than you could possibly accomplish. Not far too much, for that would crush you; but enough to check the tendency to laziness, enough to supply a perpetual spur. The evil is, that it is so difficult to realize this happy condition. Men who are able to do much are usually pressed to do far too much; and the warning which so often comes in the form of paralysis or of heart-disease, comes too late to admit of a remedy.

It must be accepted, we apprehend, as the true state of things that while there are evils inseparable from high pressure and overwork, the best that a strong man is capable of can not be done without them. Let us observe, for example, how careful an overworked man is to make the most of his time. What an early riser he becomes! Can any thing make a man start from the luxury of a half-waking, half-sleeping state in bed like the conviction that, if he is not at work at a given minute, the whole business of the day will be thrown into arrear and inevitable confusion? Dickens has a character somewhere who says he always goes to bed with regret and rises with disgust. The pressure of work removes both the regret and the disgust, for at bed-time bed is welcome to the busy worker, while in the morning it is a thief and a robber. How much more rapidly one runs through the newspaper when there are but ten minutes for it; or how much more quickly one transacts business, or makes inquiries, or goes through friendly greetings, when dozens are waiting in the anteroom, let doctors and lawyers say. "Do n't go to men of leisure when you want any thing done—go to busy men," was a saying of the late George Moore's, of Bow Churchyard, himself a busy man, the architect of a colossal business, and yet able to carry on his shoulders the interests of innumerable charities. In the United States they have a rule in some of their conventions that speakers shall not

occupy more than two minutes. It seems to many as if a speaker would need that time to clear his throat; and yet it is wonderful what can be said in two minutes when neither love nor money can eke out the allowance.

Besides saving time, the pressure of work makes the mental machinery go faster. The mind comes under an excitement which quickens all its processes. The steam gets up, and the piston flies through the cylinder like lightning. Pieces of work have been done in these moods that would not, or could not have been done under more still and quiet conditions. If St. Paul had not led so busy a life, his Epistles would have borne a different character. They would not have the stimulating power they have. The rush and rapidity of the apostle's mind communicates itself to his readers. The same thing is true, in a sense, of the speeches of most great orators. Such things could not be produced in cold blood. Men must be on wings to do them. If the rocket were not discharged in a sort of frantic excitement, it would not describe the beautiful curve which it traces. It is certain that the leisure which busy men so naturally crave would greatly restrict and impair many of their greatest efforts. Their work might, indeed, be done with more finish and beauty of detail, but it would have far less of the living and quickening power to which, very probably, its chief value is due. No doubt, if sober thought be the chief thing needed in a piece of work, the slower it is done the better; a judge must be deliberate and solemn and slow; but if the purpose be to illuminate, to quicken, to impel, the mind will be all the better of the excitement that comes from the pressure of too much to do.

When able men are urged on in this way, it is wonderful what they can do even in their *horæ subsecivæ*. Sometimes it seems as if they could never stop. They go on like the Flying Dutchman, as if they were embodiments of the perpetual motion. There is Mr. Gladstone, for example. No sooner is he relieved of the burden of the premiership than he is up to the neck in Homer. When people are wondering how he gets time to keep up his Greek, he is out with an elaborate pamphlet on Ultramontanism. Hardly is the ink dry when a publication is announced on the Turkish massacres. And when people are thinking him fairly exhausted, he goes through an electioneering campaign like a meteor, and delivers a succession of speeches, that for every quality of powerful and brilliant oratory fill the whole world with astonishment. We suppose that in his best days a similar activity must have characterized Lord Brougham. When could he have written his papers for the Useful Knowledge Society, or studied and written his chapters on Paley's "Natural Theology?" The sparks from such men's anvils are equal to the chief products of ordinary craftsmen. But even these men would probably have been eclipsed by the activity of the Spanish poet, Lope de Vega. It was calculated that twenty-one million three hundred thousand of his lines were actually printed, and no less than one thousand eight hundred plays of his composition acted upon the stage. "Were we to give credit to such accounts," says Lord Holland, "allowing him to begin his compositions at the age of thirteen, we must believe that on an average he wrote more than nine hundred lines a day; a fertility of imagination and a celerity of pen which, when we consider the occupations of his life as a soldier, a secretary, a master of a family, and a priest, his acquirements in Latin, Italian, and Portuguese, and his reputation for erudition, become not only improbable, but absolutely, and one may say physically, impossible."

With such cases before us, we come more readily to understand the paradox that the busiest men are those who have most time, or at least most capacity, for extra work. The medical profession is full of instances. It is remarkable that the late Sir James Simpson, for instance, in the midst of an unprecedented professional practice should have been a keen antiquary, and should have found time to write so many antiquarian memoirs. It is said of the late Dr. Abercrombie, that his works on the "Intellectual and Moral Powers of Man" were composed

in his carriage as he was driving to see his patients. The instances of medical men in the height of practice writing papers for the medical journals, or preparing professional works for the press, are very numerous. The faculties of such men are so ready that in their moments of leisure they can do more than many another man who has no stated work at all. Even ordinary men understand quite well how irksome a very small bit of work, like the writing of letters, is in a holiday time, when one is idle in the country; whereas in the height of one's activity a dozen letters could be dashed off in an hour, and not even counted in the hard work of the day. An able man in the full swing of his manifold work is like a machine that by belts and wheels can do all kinds of by-jobs, besides what engages the chief share of its activity.

Nor is such a life necessarily so oppressive as is often thought. Our Maker has so ordered it that one of our chief pleasures is derived from work successfully done. *Labor ipse voluptas.* There is always a gratification in "something accomplished, something done." Lope de Vega, writing his play in a single day, as he often did, had, no doubt, sufficient enjoyment in it to compensate him for all the confinement and toil. Rapid workers have not time to get disgusted with their work, as those are apt to do who brood over it. Disgust is usually the product of leisure and reflection, and comes at a second stage. If the work be somewhat varied the pleasure in connection with its completion is varied too. Hence, perhaps, is the reason why the total and sudden giving up of work is often attended with evil results. The transition from a life full of activity and rich in the enjoyment of successful labor to a life of absolute idleness with no such vivid enjoyment, has often proved fatal. There is too little activity in the new life, and too little of the pleasure of activity. Idleness without the excitement and pleasure of work becomes depressing. The vital forces droop and decay. On the other hand, to the busy worker, rest and recreation have a double relish. No holiday is so refreshing as that in which he runs away from his labors, and enjoys himself in quite a different scene. Swiss mountains and Swiss air have then a double charm. The interval is too short to produce the *ennui* that attends permanent separation from active pursuits. Few things live in the memory more vividly than the first month in Switzerland in the heart of a too busy life.

Too much to do, besides its direct effect on the busy worker, exposes him to certain inconveniences apt to escape the notice of others. One of these is the effect produced on his memory. One who leads a rushing life, who has to hurry from one thing to another and from one person to another, without a moment's interval, can not have a vivid remembrance of many things that happen in his experience. He is necessarily liable to forget, in a way that another can not understand. Many a busy physician has found himself at times in serious trouble from this cause. He has made a promise to a patient, but before the promise had hardened in his memory some exciting case has hurried him away, obliterated the impression, and the promise has been forgotten. Authors' memories have been known from a similar cause to play them strange tricks. We know an author who was engaged in writing a book amid many other absorbing occupations. For some weeks the book had to be laid aside. When leisure came he resumed it, as he thought, at the point where he had broken it off, and got through a considerable chapter when, to his mingled amazement and amusement, he found in his drawer another manuscript almost precisely similar, the existence of which he had quite forgotten. So strange and incredible are these tricks of memory that sometimes the most honest of men, if examined in a court of justice, would hardly be believed. The *non mi ricordo* would hardly be accepted by those who have had little experience of the difficulty of carrying in the memory impressions which have not had time to photograph themselves on its tablets, or have been blurred by other impressions following too quickly.

If a busy man is guilty of some neglect leisurely people are apt to fancy an inten-

tional slight where nothing of the kind was dreamed of. In the case of such a man there is a twofold reason for applying the rule which Elizabeth Barrett, in one of her letters to Mr. Horne, thus gracefully acknowledged: "In one letter was something about neglect; you told me never to fancy a silence into a neglect. Was I likely to do it? Was there any room for even fancy to try? That would be still more surprising than the fact of your making room for a thought of me in the multitude of your occupations."

In the "Life of Charlotte Brontë," if we remember rightly, it is told how once, at the beginning of her literary life, she took it into her head that an eminent publisher was dissatisfied because he did not at once acknowledge and answer a letter accompanying a manuscript. At Haworth it was not easy to understand the ways of Cornhill or Paternoster Row. We can fancy the grim smile on the face of the publisher, overwhelmed in all likelihood with letters, manuscripts, proofs, books, bills, and business of every sort, at the gentle impatience of the lady. Most publishers and editors, too, have doubtless had rather amusing experiences of the innocent impatience of correspondents. Letters to the editor often run as if the poor man had nothing whatever to do from morn to dewy eve but attend to their papers. He may be struggling like a dray-horse in an overloaded wagon to overtake the piles of crabbed handwriting in prose and verse that burden his table, ranging from essays in Chinese metaphysics to lines on a snowdrop, and possibly, in regard to a given paper, thinking of inserting it in the course of the season, when down comes a thundering epistle demanding why it did not appear in the last number. Well, the impatience of correspondents is not always innocent. Some have a spiteful pleasure in stinging the editor for "rejecting" what the unhappy man never asked. If he had only time, he might explain things, and perhaps pacify them; but perhaps not. Editors, we suppose, must submit to be counted tyrants, and probably fools to boot, by a large proportion of the ill fated volunteers to whose surpassing merits they are so often inveterately blind.

More amusing are the strange fancies that some persons have as to what overworked men may be asked to do for them. In the very thick of the American war, there came to President Lincoln an Illinois farmer, in a great state of excitement about a pair of horses that one of Lincoln's generals had requisitioned for the war. The owner was, of course, entitled to compensation; but somehow it had not come. Going to the President, he told him his story, and was rather chagrined to be told that it did not lie with him to pay the money. "Then," says the farmer, "will you undertake to write to the general, and see that the matter is settled properly?" Poor Lincoln, who never wanted a story to help him in an emergency, was ready for his visitor. "When I was a rail-splitter," he said, "there lived near us a smart young fellow, the captain of a Mississippi boat, who could steer a vessel over the rapids with wonderful skill, as hardly any one else could. One day, when he was grasping the wheel with his utmost strength, at the most critical point of the rapids, a little boy came running up to him in great excitement, and said, 'Cap'n, stop your ship; my apple has fallen overboard!'" In the "Life of Sir James Simpson," there are some curious notices of the extraordinary things that patients in the country would sometimes ask him to do. Once a gentleman wrote to him asking him to send him a copy of the prescription which he had given him some years before, when the doctor could hardly recall the man, much less the prescription Others would ask him to go to Duncan & Flockhart's and get them some particular medicine. A very busy clergyman of our acquaintance, when over head and ears with many things, once got a letter from a stranger in the United States, explaining that more than a century ago, some one of the name of G —— owned a property near Edinburgh which was believed to have been destined by will in a particular way, so that the relatives in America thought they had some claim to it. He was requested to in-

quire into the matter, find out about the will, communicate with the present owners of the property, and put every thing in train for a just settlement of the claim. It would have been reasonable for the writer to inclose a bill for five hundred dollars; but that, unfortunately, he omitted to do.

Unreasonable though it be to plague overworked men in this way, it is very interesting to find such men volunteering, in the midst of a hundred other things, to do some useful service to the friendless or the poor. Nothing could have been kinder, for example, than the act of Sir Walter Scott, writing out sermons for a young aspirant to the Scottish ministry, whose state of nerves made him unable to grapple with the task, and satisfy his presbytery. Similar, though in a quite different sphere, was the kindness shown by Vinet, at Lausanne, to a peasant woman who invaded his solitude one Sunday morning. Overcome by toil and illness, Vinet had been obliged to forbid the visits of strangers, and his family were guarding him with all possible care. The woman was an intelligent, God-fearing peasant, who had never succeeded in getting rest for her spirit; but, having fallen in with one of Vinet's books, she was persuaded that if she could only see him, he would be able to give her the needed guidance. With much difficulty, she got admission to his room. We can fancy the anxious relatives enjoining her to detain him as short a time as possible. But Vinet, when he heard her story, was profoundly interested, and spent the whole day with her, up to the hour of the last stage-coach. The account which the woman gave to her own pastor, on returning home, was interesting. "Well," said the pastor, "have you been able to see him?" "Yes," she replied, "and at last I have found one who has humbled me." "Humbled you! M. Vinet is not the man to humble any one." "Yes, humbled me, and humbled me profoundly. In contact with his humility and goodness, I felt all my pride give way." Then she told how thoroughly he comprehended her case, how patiently he spent the whole day with her, and all in such a homely way that she felt as if he was her brother. A few days after, Vinet sent her a book newly published, as if she had been one of his chosen friends.

The anxiety of busy men to make up for any little want of attention to persons whom they ought to have known, illustrates the same spirit of Christian chivalry. In the correspondence of Dr. Chalmers there is a characteristic letter to the daughter of the late Sir David Brewster, in the following terms: "19 York Place, 28th May, 1845. *My dear Miss Brewster*,—I can imagine nothing more monstrous than the stupidity into which I fear I must have fallen, if it was really you who sat near the moderator's chair this evening, and on whom I speculated in my own mind for hours as one I ought to have known. It is far the most mortifying instance, though many such have occurred, of my utter want of the organ of individuality; but I never could have fancied it possible that it ever could have happened in the case of one in whom (forgive me for saying it) I feel so much interest. It would comfort me effectually if you would have the goodness to let me know where and when it is that I may have the pleasure of waiting upon you. Ever believe me, my dear madam, yours most affectionately and truly,

"THOMAS CHALMERS."

Of all the instructive instances of busy lives we have, that of our Lord is far the most remarkable. It is only when we pay minute attention to the notices of his labors that we can understand what a crowded life he led. Galilee alone, through the whole of which he made several circuits, embraced, according to Josephus, two hundred and four towns and villages; and, besides Galilee, we read of his visiting the remote north, at Cæsarea Philippi, the remote north-west, in the coasts of Tyre and Sidon; we know of his passing through Samaria, of his being on the east side of Jordan, and of his being often in and near Jerusalem. Throughout every part of this wide district, he not only preached, taught, and healed, but he had numberless collisions with opponents; he lived under a constant apprehension of attack; he carried on the training of the apostles, and in their slowness of heart, forget-

fulness, want of faith, and personal strifes, he encountered a serious addition to his burdens, although it would be harsh to suppose that on the whole their company did not cheer and refresh him. The strain on the bodily energies in a life involving so much physical movement and labor must have been very great; the strain on the nervous system where there was so much excitement, and where such vital interests were at stake, must have been even greater. And yet he appears to have gone through all his labor with marvelous calmness and self-possession. From the narrative of his life, nothing is more remote than the air of bustle or hurry; it has, indeed, quite a wonderful aspect as of Oriental calm and leisure. Owing to his systematic way of working, he was always beforehand, always ready. His discourses have a marvelously finished air, as if they had been all matured before they were spoken. His very answers to casual objectors were marvelously clean-cut and finished. He never found himself in a situation in which he was disconcerted, or at a loss how to act. And in his mind one thing was never allowed to jostle another, however full it might be of projects, or however burdened with responsibility. The last scenes of his life exemplify this orderliness and business-like composure of mind in a wonderful way. And what we have already adverted to as so chivalrous in busy men, when turning aside to care for others,

> "The mind at leisure from itself,
> To soothe and sympathize,"

was singularly beautiful in him. The farewell discourse, the intercessory prayer, the healing of Malchus, the look turned on Peter, the word to the daughters of Jerusalem, the prayer for his murderers, the promise to the thief, the commending of his mother to the beloved disciple—what wonderful consideration for others did all these imply, in the midst of his own great agony? How well he knew how to conquer the snares of overwork, and turn every thing to the highest ends of life! How wonderfully the divine shines through the human, without overlaying it in that unexampled career!

We have glanced at some of the phenomena of that busy mode of life which seems to be more common in this age than in most that have gone before. It has its drawbacks and its dangers, but is not without compensations, and even blessings.

THE MORNING STAR.

SOLDIER of Christ, why thus cast down?
Why drops thy nerveless hand?
Have faith and hope and courage gone?
Fear'st though the alien band?
Take heart, 't will not be always night;
Thro' riven clouds afar
Gleams down in rays of diamond light
The bright and Morning Star.

Seek not the ground in weak despair,
Nor break 'neath suffering's rod:
The fight thou wagest is the care
Of the all-loving God.
Joy comes through sorrow; death brings life;
Peace rides on battle's car;
And beams, on darkest night of strife,
The bright and Morning Star.

Press on the foe! God rules the years,
Wrong shall not triumph long;
Expectant faith already hears
Truth's glad, victorious song.
The nations soon shall own their King,
The wise, from near and far,
Once more to him their offerings bring—
The bright and Morning Star.

Then fear not, Christian, for the right!
Nor falter 'mid the fray;
For truth is victor; error's night
Flies from the coming day.
Thine eye, through dust and tears, may see,
On heavens broad scroll afar,
The promise sure: "I 'll give to thee
The bright and Morning Star."

PETER CARTWRIGHT, THE WESTERN PIONEER.

AT a certain ministers' meeting in the Connecticut valley some months ago it was determined to have a series of papers prepared and read, in which the different Christian denominations should be shown up, each in the character and career of one of its representative men. One of the topics suggested was "Peter Cartwright and Methodism," and the person to whom it was assigned having large ignorance of his theme, made application for assistance to an eminent doctor of divinity whose experience had been more fortunate, and who, out of brotherly commiseration for his hapless neighbor, undertook the task himself and presented an essay on John Wesley, Francis Asbury, and the Methodist Reformation in England and America, to the no small delight and surprise of his clerical auditors whose education had been almost wholly neglected in this chief department of modern Church history.

It is not surprising that the sturdy vigor and quaint manners of this Illinois Methodist campaigner should have given him a prominence outside of his own Church quite disproportionate to his actual achievements and his real character. Those of our own people also whose studies in the annals of their own communion have been chiefly with a view to amusement have doubtless set him down as a fine specimen of pioneer Methodist preachers, a conclusion which is the very reverse of the truth; for instead of being a specimen he was notably an exception among the Methodists, and it would be far more historic, as well as more complimentary to the splendid force of mounted men which Methodism sent out to overrun the western wilderness in the name of the Lord, to give as examples of their characters and manners such men as the devoted martyr, Richmond Nolley, or the courteous and majestic Hooper Crews.

The divine wisdom in adapting means to ends appears in the choice of such men as Edward T. Taylor at the East and Peter Cartwright at the West, whose brilliant

genius or mother wit adapted them especially to reach the storm-swept natures of the seamen or the wild, uncouth spirits of the mountains and prairies. There has, however, been but one Edward Taylor, and the Cartwright type of preachers might almost be numbered on the fingers of one hand. The freshness and force of Cartwright's nature has endeared him to the Church in all its longitude, and incidents in his life, both shocking and amusing, will continue to sparkle on the pages of Methodist books and newspapers until the wildness of that frontier ministry to which he was so wonderfully adapted shall have been forgotten, and a broader culture, a more perfect civilization, and a better understanding and use of the powers of the Gospel shall have caused men to forget the vagaries and only remember the divine election and endowment of this sincere but erratic man.

Peter Cartwright was the only son of a soldier of the Revolution. He was born in Amherst County, on the James River, in the State of Virginia, on the 1st of September, 1785. While he was yet a child his parents emigrated to Kentucky, where they kept up a hand-to-hand fight with hostile Indians, hewed down the primeval forests, and lived on the noble game which ranged in great numbers through the woods. Kentucky, at this time, was claimed by no particular tribe of Indians, but was regarded as a common hunting-ground by the various tribes, east, west, north, and south. It abounded in buffalo, elk, deer, bear, turkeys, and other smaller game, and because it was their choicest hunting-ground the Indians made common cause against the whites to prevent their taking possession of it. Many bloody battles were fought, in which hundreds of white men and red men were killed, until "Old Kaintuck," as it is sometimes affectionately called by its admiring children, received the name of the "Land of Blood." Thus it appears that Cartwright came of Indian-fighting, pioneering stock, and throughout all his long and eventful life he illustrated that well-worn adage, "Blood is thicker than water."

In 1793 the Cartwright family settled in Logan County, in the southern part of Kentucky, which was then known as "Rogues' Harbor," a section of country where murderers, horse-thieves, highway-robbers, and counterfeiters, who were fugitives from justice, had assembled in such numbers as actually to form a majority of the citizens; and it was only after the friends of law and order had organized themselves into a band of regulators, and driven off or exterminated these outlaws, that Logan County became habitable for decent people.

Peter was a wild lad, given to dancing, card-playing, and horse-racing. In his autobiography he mentions the fact that his father bought him a pack of cards and also presented him with a young race-horse, which animal, he says, came near being his everlasting ruin. His conversion was one of those striking and radical experiences of grace which well accorded with his impetuous nature. From childhood he had been the subject of frequent religious impressions, which, however, he had either played, raced, or danced away; but in his sixteenth year, after returning from a Kentucky wedding, where he had enjoyed a particularly good time, he was overwhelmed with a sense of the folly and danger of the life he was leading, and in great agony he fell upon his knees and began to ask God to have mercy upon him. His next step was to give up the race-horse to his father and hand over the cards to his Methodist mother, who threw them into the fire, and after days and nights of anxiety and horror in which he almost felt the fingers of the devil clutching him to carry him away, he emerged from darkness into light and from blank despair to unspeakable joy. This transition occured at the memorable Cane Ridge Camp-meeting, which was the commencement of that great revival that in 1800, and the two or three years following, swept over the country from the wilderness to the sea.

"In this revival," says Cartwright, "originated our camp-meetings, and in both denominations (Presbyterians and Methodists) they were held every year, and, indeed, have been ever since more or less. They would erect their camps with logs or frame them

and cover them with clapboards or shingles. They would also erect a shed sufficiently large to protect five thousand people from wind and rain and cover it with boards or shingles, build a large stand, seat the shed, and here they would collect together from forty to fifty miles around and sometimes further than that. Ten, twenty, and sometimes thirty ministers of different denominatoins would come together and preach, night and day, four or five days together, and I have seen more than a hundred sinners fall like dead men under one powerful sermon, and heard more than five hundred Christians all shouting aloud the high praises of God at once. Some sinners mocked. Some of the old dry professors opposed. Some of the old starched Presbyterian preachers preached against these exercises; but still the work went on and spread in almost every direction, gathering additional force, until our country seemed all coming home to God."

During this revival, as, indeed, has been a well-known feature of almost all revivals since, the Calvinistic Confession of Faith was quietly ignored, and the Presbyterian ministers preached free grace and individual responsibility as heartily as their brethren, the Methodists; but when the revival wave had passed the Kentucky Presbytery bethought them that it was time to dress their line and restore their ancient creed. Against this the men who had been foremost in the revival rebelled and still kept on preaching free salvation in spite of the Westminister Confession, for which contumacy and "heresy" some of them were suspended, others surrendered their credentials of ordination, and the rest were summarily cut off from the Kentucky Presbytery. While in this "amputated condition" a general meeting of all licensed Presbyterian preachers who had become Arminian in their sentiments was called, at which it was agreed that they should offer themselves in a body as members of the Methodist Episcopal Church; but the Methodists declined the overture, since there were still lingering in their minds such remains of their Presbyterian education as would doubtless require too long a novitiate to remove; or, perhaps, the presence of such a foreign body in the Methodist ranks might result in a division therein. They were, therefore, advised to embody themselves into a fellowship of their own, which advice they reluctantly followed, and in due time established the Cumberland Presbyterian Church, which is largely Presbyterian in order and largely Methodist in theology.

After his conversion young Cartwright was at once pre-empted for the Lord, and in May, 1802, being then only nineteen years old, he received his license as exhorter from that noble hero Jesse Walker, the Daniel Boone of Western Methodism, and was received in 1804 as a member of the "Western Conference," which, at that time, included all the Methodism west of the Alleghany Mountains. He was first sent out as junior preacher along with Benjamin Lakin, one of the giants of those days, to travel the Salt River and Shelbyville Circuit in a district that comprised the whole of Kentucky.

At that time there was not, as at present, a course of study marked out for candidates for the itinerant ministry, but William M'Kendree, his presiding elder, afterwards bishop, directed his course of reading, and at every quarterly visit examined him as to his progress. Thus his preparation for the ministry went on along with the ministry itself; and in his case this was undoubtedly the best if not the only method possible.

"The Kentucky Boy," as young Cartwright was now called, soon became a favorite in all that region of country. Especially was he in request at camp-meetings, where his preaching was often accompanied by wonderful displays of spiritual power. The multitudes who crowded about his rude pulpit in the woods were swept by heavenly hurricanes as manifestly as were the tree-tops above their heads, and sinners by scores, sometimes even those who had come for the avowed purpose of breaking up the meeting broke out into irrepressible cries for mercy, or fell as dead men to the earth. His sermons consisted of shrewd arguments against predestination, antinomianism, exclusive immersion, and such like errors, of bold and scathing reproofs of dissipation, dishonesty, idleness, and all the other vices prevalent in

a new country, the whole plentifully interspersed with well put quotations from the Scriptures, and admirable and well told incidents from his experience or observation. There was, of course, in all this nothing to set strong men trembling from head to foot, to bring a cursing, drunken ruffian from his saddle to his knees, or to prostrate whole companies of people as by a discharge of grape shot. These were doubtless the visible demonstrations which God in his wisdom and mercy gave to the dull minds of the backwoods populace of the truth of the Gospel as preached by his servants.

The dense ignorance which prevailed among the people of the great frontier circuits is illustrated by the following incident from the experience of Wilson Lee, another of the Kentucky pioneers. On one occasion Lee had been preaching from the words, "Except a man deny himself and take up his cross, he can not be my disciple." In the congregation were a Dutchman and his wife, the latter of whom was a notorious scold. Both of them were profoundly impressed under the sermon and wept aloud in view of their sins. On his way to his next appointment Lee observed, some distance ahead, a man trudging along carrying a woman on his back, at which he was greatly surprised, presuming that the woman was either sick or dead. But his surprise was increased to amazement when on riding up he discovered it to be the Dutchman, who was transporting his wife in this peculiar fashion.

"Why do you carry your wife? Is n't she able to walk?" said Lee.

"Vell," replied the Dutchman, "zhoost now you dell us dot ve dakes up our gross if ve vish to be safed; und dis vrow, she be so gross as never vas. She scold und scold all de time, so I dakes her up and bears her, for I feels me so bad I must somehow or oder git myself safed."

Before Lee came around his circuit again the Dutchman and his cross wife were happily converted, and he received them both into the Church. The vrow became sweet and gentle, and the two lived long and happily together, giving ample evidence that the grace of God was able to reach even the most desperate cases. Among such a people in times of great religious excitement and under the down-lighting of the powers of the world to come, no wonder that the sermons of the backwoods preachers should have been attended with marvels, the like of which, in what this great man would call "these degenerate days," are happily not to be found.

Cartwright quotes Brother Axley, one of his rude but efficient comrades in the ministry, to the effect that "a preacher who is good and true has a trinity of devils to fight; namely, superfluous dress, whisky, and slavery." Against these three enemies Cartwright, in his volume as well as in his sermons, has borne earnest and faithful testimony. On the subject of superfluity in dress he is also very plain, denouncing without stint the ruffles and flounces, the broidered hair, the rings, the bracelets, and other fashionable follies, all of which he regarded as enemies of righteousness, and he gives instance after instance of fine ladies who, being struck under conviction in his congregations, first gave their jewelry into his hands to be disposed of for religious purposes, and then, having parted with their last idol, they were joyfully and soundly converted. Like Finley, who worked the Methodist Discipline as a most efficient temperance society, Cartwright made use of the General Rules as a temperance pledge, and insisted that those who came into the Methodist Church should leave this devil outside. On the subject of slavery, Cartwright had clear and distinct opinions of his own. He believed it to be a sin to buy and sell human beings, and a misfortune to have the responsibility of their ownership and management, but especially did he regard it as a sin for ministers or laymen to agitate this question in such a manner as to imperil the peace and unity of the Methodist Episcopal Church. In harmony with the views of President Lincoln concerning his duty of preserving the Union, Cartwright would save the Church if he could with slavery, and if not, he would save the Church without slavery.

In 1812 Cartwright was appointed by Bishop Asbury presiding elder on the Wabash District, comprising portions of the States of Indiana and Illinois. "I told Bishop Asbury," says Cartwright, "that I deliberately believed I ought not be appointed presiding elder, for I was not qualified for the office. But he told me there was no appeal from his judgment."

From this time forward Cartwright served the Church in this important capacity first on those great frontier districts, and afterward on the smaller ones into which they were divided, until 1869, when he took a superannuated relation. He traveled the Cumberland District in 1821; in 1823 he removed to Illinois and two years afterward was presiding elder of the Illinois District, which, in 1824, had become the Illinois Conference, comprising also portions of the State of Indiana.

The Illinois Conference, as bounded at present, comprises only the central portion of that State; three other conferences, namely, the Rock River, the Central Illinois, and the Southern Illinois Conferences, having been set off therefrom. Cartwright was present at forty-six sessions of the Illinois Conference, from 1824 to 1871. During much of this time he wielded almost episcopal powers, becoming at length a chronic case of presiding eldership, and having districts organized for his special convenience out of the territory over which his term of supervision had expired. In his autobiography he says, "I have often wondered at the aspiration of many, very many Methodist preachers, for the office of presiding elder, and have frequently said, if I were a bishop that such aspirants should always go without office under my administration. I look upon this disposition as the outcropping of fallen and unsanctified human nature, and whenever this spirit in a large degree gets into a preacher, he seldom ever does much good afterwards." This is the critic whose continuous incumbency of this very office at length became an embarrassment to the bishops in their administration of Illinois Methodism.

During a visit to the former range of this veteran presiding elder, one of his old comrades gave the writer the following characteristic anecdote. Bishop Waugh, at one time, determined to beard this official lion in his den, with the view to remove him from his office as elder and to give him once more an opportunity to preach the Gospel in a private capacity, as his four years' term of service on his district had just expired. But Cartwright was of a different mind, and in order that he might not be reduced to the ranks, he brought in a new arrangement of districts for the conference, including a new grouping of stations within easy reach of his residence at Pleasant Plains, to which he nominated himself as presiding elder.

At this the bishop demurred, saying: "I think it is time, brother Cartwright, that you had a change in your official relation." Upon which the old man rousing all the force that was in him, exclaimed:

"Beverly Waugh, Beverly Waugh, if you appoint another man to this district, I will travel it myself and collect all the quarterage in spite of him." And Bishop Waugh, being anxious to preserve the peace, permitted this infringement upon the spirit of the Discipline, and appointed Cartwright to the district which he had thus carved out for himself.

"When I consider the insurmountable disadvantages and difficulties that the earlier pioneer Methodist preachers labored under in spreading the Gospel in these western wilds, in the great valley of the Mississippi," he remarks in his autobiography, "and contrast the disabilities which surrounded them on every hand with the glorious human advantages that are enjoyed by their present successors, it is miraculous to me that our modern preachers can not preach better and do more good than they do. It is true, we could not, many of us, conjugate a verb or parse a sentence, and frequently murdered the king's English; but there was a divine unction attended the Word preached, and thousands fell under the mighty power of God."

In his later life it does not appear that Cartwright's own preaching was attended by any such wonderful demonstrations;

therefore, his implied charge of degeneracy in the Methodist ministry, in view of the want of these marvelous scenes, might more properly take the form of confession of his own backsliding, if the basis of his conclusion be true. During the early years of Cartwright's ministry there was a wonderful revival of religion enjoyed by the whole country, and during a little more than ten years the Methodist body was tripled. This, however, is not to be credited to any superiority of the men or the methods of early Methodism over those of recent date, since the statistics for the next decade, from 1810 to 1820, show an increase of less than fifty per cent, and of the decade before the great revival period, that is, from 1790 to 1800, of only 12.6 per cent, while the decade from 1860 to 1870 shows an increase of 37.47 per cent.

The supreme contempt of Peter Cartwright for the scholarship of the modern Methodist pulpit is forcibly expressed in his autobiography. "I do not wish to undervalue education," he remarks, "but really I have seen so many of these educated preachers who forcibly reminded me of lettuce growing under the shade of a peach-tree, or a gosling that had got the straddles by wading in the dew, that I turn away sick and faint. Verily, we have fallen on evil times. Is it possible that now, when we abound in education, we need Biblical instruction more than when we had no education or very little? I awfully fear for our beloved Methodism."

And yet with all his poor opinion of colleges, and those who received their instructions, he had at least one weakness in that direction. During the later portion of his life, when he had become a sort of pet amongst his brethren, one of those despised colleges, half in sarcasm and half in flattery, conferred upon the old pioneer the degree of doctor of divinity, and this advocate of Methodist plainness, this vehement opposer of modern learning, was pleased to accept the absurd compliment. Thereafter he made good use of the two capital letters which he was entitled to write after his name, and the omission of them by any of his brethren, when writing or pronouncing his name, he regarded almost as a personal affront.

In sentiment Cartwright was an intense Methodist; his love for and loyalty to the Church having been greatly strengthened in early life by frequent conflicts and controversies with ministers of other faiths or unbeliefs who sought to entrap his converts or oppose the progress of his work. One of his chief afflictions was the Baptists, and if one may credit the statements of his autobiography, which was written near the close of his life, and almost wholly from memory, the Baptists had very little reason for being fond of him.

On the Waynesville Circuit, which comprised the whole country between the Green and Cumberland rivers in Kentucky, besides quite a large section of Tennessee, Cartwright was once invited to preach a funeral sermon in an old, dilapidated, deserted Baptist meeting-house, on which occasion there was "an awful shaking among the dry bones." The people begged him to preach again, and so great was the interest that the meeting was kept up night and day for some time, and resulted in the clear and sound conversion of twenty-three souls. At the close of the long service the young Boanerges informed the converts that on his next round of his circuit he would explain the rules of the Methodist Church to them and open the door to such as desired to join it. But in the mean time the Baptist preachers returned to this forsaken field, and soon had every thing well under way for capturing the converts in a body.

When Cartwright next appeared on the scene there was what the Baptist preachers called "a Union meeting" in progress, at which the young converts as well as several other persons were invited to relate their experience, were pronounced good cases of conversion, and accepted as candidates for baptism. "This," says Cartwright, "was death in the pot to me. I thought I could not bear up under it. I am bereft of my children, and what have I left?" While meditating on the situation he suddenly bethought him of a possible plan for saving the day to the Methodists, and while the

converts one after another were giving in their experience, he also, under the general invitation, rose and gave an account of his own conversion, much to the consternation of his few faithful brethren and sisters who were present, and equally to the delight of the Baptists, who saw in this act an indication that the famous Kentucky boy preacher was going to follow the converts of his ministry into the faith and order of their Church. The next morning a great multitude assembled on the bank of a fine creek in the neighborhood to witness the baptism of Cartwright, the twenty-three young converts, and two other persons who had been added to the number of candidates on the strength of some remarkable dreams they had had some years before. Three Baptist ministers were present, who, after singing and prayer, gave such exhortations to the candidates as the occasion seemed to require, and then called them to come down to the water.

The first to present himself was Peter Cartwright, who astonished the administrator of the ordinance with these words:

"Brother M——, I wish to join the Baptist Church if I can come in with a good conscience. I have been baptized, and my conscience is perfectly satisfied with it, and I can not submit to be rebaptized. Can I come into your Church on these terms?"

The startled minister inquired into the case, learned that Cartwright had been baptized by sprinkling, and of course refused to receive him into the Baptist Church unless he would be immersed. The young preacher then began to expostulate with him. "What am I to do?" said he. "The Church has heard my experience, and pronounced it good; and you believe that I am a Christian and can not fall away so as to be finally lost. Are you going to keep me out of the Church bleating round the walls like a lost sheep in a gang by myself?" This was too much for the patience of the celebrant, who sharply bade the troublesome candidate to "stand aside and not detain others."

The next to present themselves were a married couple who had been converted at the long service.

"Brother M——," said the husband, "are you going to reject brother Cartwright?"

"I can not receive him," was the reply.

"Well, if brother Cartwright, who has been the means, under God, of my conversion and the saving of so many precious souls, can not come into the Church I can not."

"Nor I," said his wife. "Nor I," "nor I," said all the others; and the twenty-three young converts filed off with their baptismal suits as dry as when they came; only "the two old dreamers" submitting to be immersed into the Baptist Church.

From the creek the congregation repaired to the church, where the young Methodist preacher was unmercifully denounced. Then followed the Baptist Supper, at which Cartwright sat down with the twenty-three young converts about him, but the deacons passed them by in distributing the bread and the wine, upon which Cartwright arose and asked that the sacred emblems might be given to himself and his company. This was refused by the ministers. Again the young preacher opened his mouth by way of urging the claims of himself and his friends to the Supper of the Lord, as they had all been pronounced good Christians by that very body of believers. But he was ordered to be silent, and the congregation was dismissed.

In a few minutes Cartwright, mounted on a log outside the church, made his defense to the people who crowded round him. "I showed them," says he, "the inconsistency of the Baptist preachers, and laid it to them as well as my experience would permit." Doubtless he felt no lack of "liberty" on the occasion, which wound up with the organization of a Methodist Church of twenty-seven members, which, before the end of the year, had increased to seventy-seven.

The wild life of that wild region doubtless called for a few Gospel pioneers of the Cartwright stamp, but only for a few. He could head a determined fight on the part of the friends of religion against the rabble who raised a disturbance at a camp-meeting, actually knock men down right and left, and when the victory had been won against

the "sons of Belial," he would mount the rough pulpit at once and preach a tremendous sermon, which would be followed by marvelous displays of convicting and converting power.

During the early part of his career Cartwright was spiritual and devoted, and his labors were blessed to the salvation of many souls; but during the last half of his life his relations to the kingdom of God appear to have been chiefly disciplinary and official, and his memory is oftenest recalled in connection with some controversial witticism or some crude exhibition of pugnacious piety, which, if not edifying, is certainly amusing. There is a charm about first things; thus it is that the sayings and doings of the Methodist pioneers who planted the standard of the cross in the western wilderness are held in peculiar honor. They were the men well adapted to their times, and in view of their sturdy piety, their knowledge of the Bible and hymn-book, their genius for overcoming obstacles, and their power of muscle, lungs, and heart, there will doubtless often arise a longing, especially in the souls of the fathers and mothers of our Church, for the appearance of another similar class of men.

After a ministry of nearly seventy years, fifty of which were passed in the office of presiding elder, and during which time he represented his annual conference at ten sessions of the General Conference, this remarkable, and, in some particulars, admirable, man died at Pleasant Plains, Illinois, on the 25th of September, 1872, in the eighty-seventh year of his age. He served his day and generation with fidelity, and his God with devotion. And with all his eccentricities, many of which were sufficiently objectionable, he did good work, and earned the veneration of those who have entered into his labors.

THE ETERNAL YEARS.

HOW shalt thou bear the cross that now
So dread a weight appears?
Keep quietly to God, and think
Upon the eternal years.

Austerity is little help,
Although it somewhat cheers;
Thine oil of gladness is the thought
Of the eternal years.

Set hours and written rule are good,
Long prayer can lay our fears;
But it is better calm for thee
To count the eternal years.

O many things are good for souls
In proper times and spheres;
Thy present good is in the thought
Of the eternal years.

Thy self-upbraiding is a snare,
Though meekness it appears;
More humbling is it far for thee
To face the eternal years.

Brave quiet is the thing for thee,
Chiding thy scrupulous fears;
Learn to be real from the thought
Of the eternal years.

Bear gently, suffer like a child,
Nor be ashamed of tears;
Kiss the sweet cross, and in thy heart
Sing of the eternal years.

Thy cross is quite enough for thee,
Though little it appears;
For there is hid in it the weight
Of the eternal years.

And knowest thou not how bitterness
An ailing spirit cheers?
Thy medicine is the strengthening thought
Of the eternal years.

One cross can sanctify a soul;
Late saints and ancient seers
Were what they were because they mused
Upon the eternal years.

Death will have rainbows round it seen
Through calm contrition's tears,
If tranquil hope but trim her lamp
At the eternal years.

MAROUSSIA: A RUSSIAN LEGEND.

FROM THE FRENCH OF P. J. STAHL.

CHAPTER X.

AS the shadows of evening deepened into twilight they came in sight of a Russian encampment. A sentinel signaled to the old musician to approach and give them music. The soldiers were scattered about their tents in various attitudes; the wounded and the dying seeking rest and solace, and the more fortunate glad to be relieved from the fatigues and dangers of the recent conflict. From the first touch of his instrument all understood that he was master of his profession, and, as he proceeded, more than one ferocious countenance was softened, more than one fierce eye dimmed with tears. When he ceased many hands had drawn money from their pockets, and a formidable-looking officer called to Maroussia:

"Come here, little sorceress. Take this to thy father."

The child could not move until Tchetchevik bade her go forward and thank the brave men for their kindness. Then, tremblingly afraid as she was, she still obeyed.

They called for one song after another. The musician yielded, giving them every variety of the heroic, the pathetic, and the tender, until their hearts were touched with recollections of their own firesides. After a little entreaty he again chose his own subject, and like the Homeric minstrels, improvised as he sang to them of a brave people who loved their own small territory, the land inherited from their fathers, tilled into fruitfulness by their ancestors, adorned and beautified by mothers, sisters, and dear ones, until it was to them an earthly paradise. Here they only asked to live unmolested, with no desire for conquest or encroachment upon their neighbors. But, alas! this could not be; the beautiful little spot was certainly invaded; their fruitful fields were overrun and destroyed by reckless soldiers, and the white hairs of age with the golden tresses of youth were made to bow in submission to the will of their conquerors. Their valiant and intrepid boys must yield to overpowering numbers and perish in the fray. In vain did the young and beautiful girl pray for the life of brother, father, and beloved one. Their homes, their towns, their country were fast disappearing from their view, and what crime were they thus to expiate? None. 'T is only because this charming country, lovely and rich in all that makes life desirable, would be as a beautiful ring upon the hand of its possessor.

In listening to these simple facts conveyed by the old man's minstrelsy many were startled into reflection upon their own surroundings, and naturally made the application. They conversed freely upon the present state of the country in which they were fighting, recurring again and again to the battle of the day before, commending their enemies for their valor and the tenacity with which they clung to their liberty, honor, and independence; acknowledging that they fought with more valor than their own men because they were fighting in defense of their homes, their wives, and their children.

The old musician lost nothing of what they were saying, and having learned enough to know how best to proceed in laying his own plans for the next day, he suddenly struck into an air so joyous, so gay, that in spite of themselves the soldiers began to dance, the older ones keeping time to the measure while the younger joined in the chorus with great glee. The old man had explained to them that he was singing the praises of a faithful young girl who sold her best petticoat to buy a pipe for her betrothed, which she lighted and carried across the battle-field in the midst of a shower of balls, placing it safely in his hands. They voted him a famous singer, and declared that he had

relieved the monotony of their evening, making it very joyous instead. They entreated him to remain with them, promising him a good supper and a bed. He thanked them gratefully, and replied with a smile, "One can not be a wandering musician without wandering," and very soon he and the little girl had disappeared in the darkness of the night.

"Do you know," he said, "Maroussia, I have heard from more than one officer to-night an acknowledgment that the late combat was so severe that it must be at least fifteen days before they will venture an attack upon Tchiguirine?"

CHAPTER XI.

THE hours flew swiftly for the little Maroussia, because her heart was full of enthusiasm and she saw that her "great friend" was satisfied. The musical evening had taught them many things, especially that the victorious were not proud of their victory, and that the conquered need not regret their efforts. All depended upon what Tchetchevik should find at Tchiguirine. O, if he could but reconcile all jealousies and produce a unity of sentiment and effort!

Before it was yet day they approached the city, resting in obscurity and apparently unguarded. No one stopped them as they pushed aside the little entrance gate, and of a young Cossack who was resting upon his arms Tchetchevik demanded the way to the house of the ataman. The soldier raised his hat slightly as a sign of respectful salute, and pointed out the way to the house of the grand ataman, which was not unlike all the rest, only more brilliantly lighted. A sentinel on guard in the anteroom opened the door at his summons, and Tchetchevik announced that he was the bearer of messages from friends at a distance to the grand ataman, to which the Cossack replied with the utmost indifference. "May I be presented at once to the grand ataman?" At the same instant the door of an inner room was pushed open, and the grand ataman himself appeared upon the threshold. His lips did not move, but his whole attitude and countenance plainly expressed "Whence and from whom do you come? what news do you bring?"

By the uncertain light his features were not easily distinguished, except his piercing eyes, which seemed like glowing coals.

"I prostrate myself before the grand ataman," said Tchetchevik, making a profound obeisance, in which the little Maroussia gracefully joined.

"You are welcome," replied the grand ataman. "What song would you sing us, my brave minstrel?"

"I have more than one for your ear," replied the minstrel, "if you will but deign to listen."

"Whence do you come?" said the ataman.

"From Zaporogue," replied Tchetchevik. "Zaporogue's brave men present their compliments to the grand ataman."

"This is no time for compliments. Come with me into my own chamber."

Tchetchevik followed, still holding Maroussia by the hand. The apartment into which they were ushered was perfectly simple and free from all ostentation, excepting a handsome display of richly ornamented arms and accouterments. Upon a table covered with books and papers, lay the baton of command, a part of the insignia of the office of the ataman—these, with some handsomely embroidered vestments upon which sparkled ornaments of gold and precious stones, were the only indications of rank and power.

The ataman treated his visitor with the utmost respect, but pointed with questioning concern to his little companion, which Tchetchevik hastened to relieve by saying, "She is deaf and dumb."

Maroussia understood at once what her great friend would have her be, and presently he added with a kindly caress, "This little head is but a tender bud drooping with fatigue upon its stem and needs rest."

The grand ataman drew forth a magnificent cloak, and pointing to a bench covered with an elegant Persian rug, Tchetchevik at once prepared a couch for the little one. She obeyed every order implicitly, and even while she watched her "great friend" with

pride and pleasure and wondered at the grand ataman, whose noble bearing and sparkling eyes repelled and yet fascinated, the sound of their voices became a confused murmur in her ears and she was in truth deaf and dumb.

The object of this visit of Tchetchevik was to induce the ataman to resign his position, which he believed to be a means of healing strife and allaying discord arising from the fact of there being two heads rather than one to the government. Voluntary abdication is not effected without a struggle even in the minds of the noblest and most unselfish. A long and earnest argument between these two men showed each to be actuated by high principle and patriotism. Finally his resolution was taken. The ataman wrote, weighing well each word. When the letter was finished he handed it to the envoy, saying, "There, art thou content?"

Tchetchevik, after reading, replied, "Contented? No, certainly, for I would give my own life to put thee in the place of him who retains the power. But I am more than content and proud that my country, our poor Ukrainia, possesses so brave a son, and should we at last be overcome in the struggle our history will count one hero more. Let thy soul be strong and well assured. Thou hast put into my hand this night the best, nay, the only, means of uniting and re-establishing the party."

CHAPTER XII.

Two weeks after the interview between Tchetchevik and the grand ataman, upon a mild, splendid evening, the old rhapsodist, with his Antigone, slowly approached a deserted village recently almost destroyed by fire. They were weary and footsore; nevertheless, they walked on courageously and with a determined air. At the extremity of what had once been a street they discovered an old well nearly covered with *débris* and weeds.

"A little fresh water will help you," said Tchetchevik; "drink, my pretty child, the water is sweet and cool."

"Thanks," replied Maroussia, and having moistened her lips with the delicious draught she came nearer the well, gazing over its margin with childish curiosity. "Ah!" exclaimed the child, and suddenly her cheeks were covered with a bright glow and her eyes sparkled, as she turned with a happy look toward her great friend. What had she seen? Nothing except a little wreath of fresh violets, such as Maroussia in her own home had always called "good fortunes." Indeed, they seemed to be the very same that she had been so happy in cultivating in her own garden. This crown had been very recently placed there by a friendly hand. To Maroussia the crown of flowers said, "All is well with those you love, and their thoughts follow you every-where." For Tchetchevik it signified "Your orders have been obeyed."

Maroussia and her great friend understood it well, yet not one word did they exchange about the simple signal. Seated beside the well they ate their frugal supper, and immediately the envoy said, "Well, my child, have you strength to go farther?"

She was already upon her feet, her eyes, shining like two stars, were turned for an instant upon her friend and seemed to ask a favor of him. At once he took the little crown of violets from their watery bed and shaking off the pearly drops placed it on the head of Maroussia.

"Dear little crown," said she; "may it remain awhile where you 've put it?"

"Surely," said the envoy, "it is charmingly becoming; now, indeed, you are a little fairy."

Maroussia clapped her little hands, which was always her greatest sign of joy.

"Now," said her friend, "before the stars of the evening are well lighted we must be at the tomb of Naddneprobka." He was not mistaken. Very soon they had reached the tomb even while the twilight lingered.

The old broken cross on the top of a high hill commanded a view of the Dnieper, and the polished surface of the river shone like silver. They heard the dull murmur of the waves as they broke on the rocks below them, and from time to time out of the profound stillness there came the piercing cry of a

sea-gull. The minstrel took his lute, and very soon the echoes of the mountain repeated again and again the full rich voice of the old man. The song was short but expressive of heart-felt patriotism. As he finished his eyes were fixed upon the Dnieper, and suddenly the cry of the sea-gull was heard again, this time from the very borders of the river at the foot of the great rocky promontory upon which they stood.

The eyes of the great man shone with a rare enthusiasm, and the echoes of the mountains repeated the refrain of a new song. The bird-like answer was heard again, and then they could distinguish the outlines of a small boat coming rapidly toward them. They could scarcely distinguish the form of the man whose hands plied the oars; but they knew he was strong, steady, and skillful. The bark flew over the water like a feather carried by the wind. In a moment Maroussia and her friend reached the shore of the river by a precipitous rocky path.

"I hope I find you well," said a familiar voice, and Maroussia gladly recognized her good old friend Knich.

"Health and good fortune," replied the great man.

"And how is it with the little girl?" demanded Knich, fixing his eyes upon her.

"O well, very well," responded the child, and she did, indeed, at that moment seem to have lost all consciousness of fatigue and hardship. But the old farmer was not content with her answer. He turned a questioning look upon the envoy, who replied: "O, my brave little companion is quite well. You can render a good account of her. Say that she has the heart of a lion with the gentleness of a dove," and his hand was laid caressingly upon the head of the child.

"Ah," said Knich, as he caught sight of the violets, "that little crown has already spoken to you I see. Thy mother's own hands wove it, my child."

"Good Knich! what pleasant things dost thou and the crown both tell me?"

"Come, come," said the envoy; "the water is calm, not a breath is stirring, we must be off."

Hardly had they spoken when the bird-like signal was again heard, this time from the lips of old Knich.

"Ah!" said Tchetchevik, "you see, Maroussia, it is the male bird which replies."

"I understand," said the little girl. "The birds on the border of this river are very fine, although they can not all fly."

Once out in the broad river the two men talked earnestly of the state of the country.

Tchetchevik told of the noble deed of the grand ataman, whilst Knich complained of the too luxurious surroundings and selfish living of the one in command.

The envoy had made a comfortable resting place for Maroussia in the bottom of the boat; but the child's heart was too full to give sleep to her eyes. Presently she said, "Do you not see something away over there on the shore?"

"The child is right," said Knich.

The bark glided rapidly under the redoubled efforts of the rowers, and very soon Maroussia, in spite of the deepening twilight, recognized the two old friends whom they had left bound hand and foot in her father's cabin, Semene Vorochilo and Andry Kronk.

"God be praised," said the men, as they stepped into the skiff; and raising their hats with respectful salute they added "health and good fortune."

Then drawing from his breast a small package, he gave it to Maroussia, saying, "This was sent thee by thy mother."

The child fervently kissed the package. "Ah, doubly welcome is all that comes from the hand of my mother; and is all well in the home?"

"All, young and old," replied the man.

"And—and—" said the child, blushing, "tell me of the garden and the cherry trees."

"Ah, what a little housewife she is," said Andry; "the garden is beautiful, and, God willing, the cherry trees will bear abundant fruit this Summer."

"I thought of the cherry trees for the little brothers," said the child.

"What news do you bring me?" said Tchetchevik, "in return for what I have sent?"

"Many are ready to do your bidding; but others think you are going too fast, and I am inclined to believe they are half right."

"Yes, the old story of the crawfish," said Tchetchevik. "You remember the crawfish started in great haste to replenish her jug of water, when a long continued drought had thrown the neighborhood into despair. Every one commended her energy, and she made great progress; but finally she grew tired and began to flag, saying to herself, 'What's the use of hurrying so to save myself and others who are taking their ease? I will be reasonable. I will go slow.' So saying she took up her ordinary gate, and at that rate consumed seven years in reaching her destination, and ten in returning to her starting point. But where were those whom she started out to benefit? The poor crawfish was so astonished that in raising her claws with a gesture of despair, she forgot the pitcher of water she was carrying, and letting it fall the pitcher was broken into a thousand pieces and the sand drank up the water in the twinkling of an eye. The next day the poor crawfish was dead."

Andry Kronk scratched his ear and rubbed his head, while Vorochilo tapped him upon the shoulder, saying, "Wake up, and let's arouse all the rest. Tchetchevik is right." So saying each set out on their different routes.

A little distance beyond Knich showed them a beautiful black charger ready caparisoned. Tchetchevik mounted and Maroussia sprang lightly behind him. When the faithful animal had carried them to the destined place he would return of his own accord to his master. A few days afterward our travelers find themselves in the city of Gadiatch, the residence of the grand ataman, just now under the protection of the Russian czar. Here he learns much of the character of this weak yet well disposed man, who has not the nerve to relinquish the luxury and ease of foreign protection, whilst his heart and conscience are loyal to his beloved country. The old minstrel and his little *protégée* finally gain admittance to the residence of the ataman—secure the cooperation of Mephodievna, his sister, whom the people adore as their great benefactress, their city's pride. Tchetchevik found her ready to obey his orders, and she became to him an aid-de-camp.

CHAPTER XIII.

NEARLY a year had passed, and Ukraine felt herself almost free. The whole country had risen as one man, and the invaders, surprised by so energetic, spontaneous, and general a movement, had disappeared. The peasants had again taken possession of their fields, their cabins, and their farm-houses. Step by step from lake to river, from the plains to the forest, the enemy had fallen back. The ataman of Tchiguirine, after having heroically defended and saved his city, was killed; but he died contented in the hour of full triumph. A man, unknown until now, Tchetchevik, "the lion," for so the people called him, had found and buried the body of his chief, covered with noble wounds, and took his place at the head of the army. The other ataman, now recognized as the supreme head of the country, had recovered all his old vigor, and by his side was often seen a splendid woman, beautiful as the day, whose presence had always the effect to reanimate the soldiers and kindle their enthusiasm and courage into the brightest flame. She appeared everywhere, even in the midst of the rudest combats, followed by an intrepid little page, who served as a standard bearer, and who, mounted upon a fiery black charger, waved her flag with a valiant hand in the midst of flying balls with apparently no thought or care of the danger. The soldiers adored this little warrior, for she was as beautiful as an angel. And she was an angel; though but a simple village child, she was animated by a divine flame, a superhuman courage, that made her recoil from nothing. Our little Maroussia was a veritable "infant Joan d'Arc," in a country where that name was scarce ever heard and her history but little known.

Tchetchevik was compelled to be everywhere, and he had, therefore, attached her to Mephodievna, and they were inseparable. Ah, that glorious epoch, that last brilliant

and successful effort of the little province will never be forgotten by the children's children.

The Winter of this year was unusually severe, causing active movements to cease, and in the quiet lull of their Winter-quarters the heart of Maroussia turned to her home, and the child drooped ever and anon, without being willing to acknowledge her heart yearning; but her brave, good friend saw, came to her relief, and she had the delightful surprise of joining the family group around the warm, cheerful hearth-stone during the Christmas holidays.

When her great friend told her of his arrangements for this journey the child only clasped her hands, exclaiming joyfully, "O, Christmas, Christmas in the cabin of my father! Christmas near my mother—their dear hands laid once more in blessing on my head! Christmas with the little brothers and sisters around me!" and the grateful tears and smiles both at once shone in her beautiful face. The good, brave envoy wrapped the little one in his own fur-lined coat and carried her as tenderly and safely as a mother carries her babe, restoring to the arms of her parents his little guide and blessing, whom they had so cheerfully lent to him.

Four days afterwards and Maroussia, not yet willing to quit her country's service, came again to the camp, her heart overflowing with happiness for all she had given and received. She had been recognized by friends and neighbors as standing between the lion and the beautiful Mephodievna, a great servant of her country. Why may we not leave her here? Why follow out the history into its bitter realities? Why must we, after so brilliant a career, enter again the dark shadow land?

The lion-hearted leader, Tchetchevik, had every reason to believe that the sun of a second year would ripen all his plans for success. It had been a question more than once with the enemy how they might best secure this noblest of men for their ally. He was brave, generous, and honorable, and they desired to offer him conditions of peace acceptable to the whole country. His noble defense of Gadiatch, taken and retaken three times from the enemy, would ever be remembered, and the army that he was fighting as well as his own brave soldiers revered and blessed him for his tender care of the sick and wounded. He with Mephodievna and the angel Maroussia became the three cherished images dear to Ukraine. But the counsel of the war party prevailed, and the enemy returned in still more formidable numbers, and the days of darkness, of night marching, of secret plotting, and counter-plotting were renewed. But the end drew near.

CHAPTER XIV.

"HAVE we much farther to walk?" asked Maroussia.

"Happily, no," replied her great friend. "Do you see that forest to the right? There we may rest. But you are too tired, my little one." And, although she protested, saying, "a soldier must not be conquered by fatigue," he lifted her in his strong arms, and soon the little tired head drooped upon his shoulder. After a whole year of a life of such peculiar excitement, the little heroine was glad to find herself again a child, and to rest as in the arms of a father.

The day was beginning to break, and they were crossing a little strip of woods sown thickly with the most beautiful wild flowers.

"O, see, Maroussia," said her great friend, "what beautiful blue-bottles. I've never seen so many nor so fine!"

Words can not express the tenderly caressing tone of the great, strong man when he spoke to his little friend. A mother could not smile more sweetly nor speak more gently to her babe.

"Do you know, Maroussia, I would like you to sit still here awhile and weave me a wreath of these beautiful flowers. I am sure your little fingers would do it skillfully." So saying, he placed the child upon a comfortable mossy seat, and while she arranged the wreath to please him, they talked of that which interested them most; their desolate country, their victories and their losses; of their now scattered army, and of Mephodievna.

"Ah, dear child, was it not a sad day for

thee when first I crossed thy father's threshold?"

The child quickly placed her hand upon his lips, saying:

"O no, no; hush, do not take away all my courage, which my father commanded me to cherish. I shall have need of it until the end—yes, even until the end. And O, how beautiful has been our life since we left the home—beautiful days, beautiful dreams! We must not think of our losses and disappointments. See, I am no longer sad."

Thus did the child ever reanimate and encourage the flagging spirit of the soldier. Presently they set forward, and walked on in silence toward the wood a little beyond. The forest was so very thick it was almost impossible to advance. Still they pressed onward, without complaining of the thorns in their difficult pathway. The great man knew his destination. He was ever on the alert, examining every bush, lending an ear to every sound, quick to discover the least trace of what he wished to discover. Finally they reached the thicket.

"Rest here," said he to Maroussia. "See what a rich, luxurious carpet. Our ataman himself has nothing so soft and beautiful as this. Sit here at the foot of this oak. This is the grand ataman of the forest. He has perhaps seen a thousand years without making a mistake in all these ages, and the stars of heaven have always been his sufficient crown."

It was truly a grand old oak, its majestic branches spreading out on all sides, and growing so luxuriantly that the rays of the sun could not penetrate, though its lofty summit was ever encircled with a halo of glory. Close beside this lordly monarch rested the blasted trunk of another tree, and there instantly the eye of Maroussia caught sight of another wreath of the beautiful blue-bottle blossoms. Neither the man nor the child expressed astonishment at the discovery. He only threw it upon her lap, saying:

"This one well matches your own. And this crown tells me that we will not be alone in the forest. Our friends are on the march and our scouts have preceded us."

Suddenly from the depths of the forest there came a cry—the shrill whistle of a bird.

"That was the voice of a young one," said her great friend. "See, Maroussia, I shall teach him a lesson," and the soldier putting his finger to his lips uttered a bird-like whistle, which resounded through the deep woods and must have been heard for miles around. From all sides there came responsive sounds. "I must leave you for a while," said Tchetchevik. "You must not be uneasy. Do not change your place; I will return very soon. You will not quit your post?"

"I will remain here," replied Maroussia. And she thought as he left her, "He is going to guide and save our fugitives. Perhaps he may collect them together once more."

The great man had put aside the thick branches and started for the rendezvous; but he seemed so much to desire to look once more upon his brave little comrade that he returned to her side, saying:

"Above all, do not have sad thoughts. You must not despond, to-day nor ever."

"No, I shall not be sad," replied Maroussia; "I shall be firm. Now I could even die without a murmur."

They exchanged a look of mutual confidence and affection, and the great man disappeared in the depth of the forest.

CHAPTER XV.

MAROUSSIA listened for a time to his retreating footsteps; but very soon all was silent, not a branch was stirred, not a twig was bent, and the child sat in an attitude of deepest thought, her pretty head inclined upon her breast, while the wreath of flowers fell from her relaxed grasp. She thought of all that had passed and of all that might yet come until the last ray of light had passed from the forest and the night had come down upon her. She was startled, and exclaimed:

"He said 'I will return very soon. I leave thee for a few moments only. Do not leave this spot.' I am at my post, but many moments have passed, and he does not return."

Suddenly from all sides there came the firing of guns which seemed as if there was

fighting in every part of the forest. "O," thought the child, "they have been surprised in this deep wood by an ambuscade," and, pressing her little hands to her forehead, "I will think no more. God is above. We must await our destiny from his hand," and reassured, she sat down at the foot of the old oak tree, uttering only one ardent prayer, "God grant I may see him once again."

Presently the branches were put aside, and the figure of her "great friend," clear in the moonlight, appeared before her. God had heard her prayer. The next instant she was so struck by his pallor that the cry of joy died upon her lips.

"Maroussia," said he, "do you see this red handkerchief?"

"Yes, I see it," said the child.

"Well, I am going to take thee to the border of the wood. I will show thee a road which thou must follow without turning aside. Keep always to the right until you reach a field of wheat. A footpath across this field will lead thee to a little bridge; upon this bridge drop the two crowns. Upon the other side of the bridge thou wilt perceive to the left a little wood. A man will presently come out from the wood, and if he say to thee, 'May God help thee,' thou shalt answer, 'God has helped me.' Then thou shalt give to him this handkerchief. Do you understand me well, Maroussia? Wilt thou forget nothing?"

The great man spoke very slowly and evidently with great effort. He became paler and paler and the large drops of sweat stood upon his forehead and he leaned against a tree for support.

"You are wounded," said Maroussia. "O they have wounded you."

"It is but a scratch, Maroussia; to-morrow it will all be gone. Go, my dearest, go quickly."

She took his hand crying out, "How cold your hand is."

"Do not think of my hand, dear heart, only hasten. First leave your crowns upon the bridge, then to the man from the little wood give the handkerchief, repeating the exact words I told you. Have courage, Maroussia. It is for the salvation of the brave defenders of Ukraine."

The great friend made an effort to put aside the branches and conduct the child upon her route, but his strength failed, and for the first time this appearance of weakness in one whom she held as the personification of strength, froze the heart of the child. But she asked no question. She understood that he had spoken all he wished and she prepared to obey.

At this moment the branches were put aside by another strong arm, and instantly Maroussia placed herself in an attitude of defense, only fearing greater danger to her friend.

"This is a friend, Maroussia, a friend sure and faithful," he said; and she perceived in the midst of the foliage a peasant of commanding figure who made a most respectful salute. "This is my comrade Ivan," said Tchetchevik, "you may trust him." The man looked with evident concern upon his chief, but Tchetchevik reproved him saying, "You must not think of me, but of the others whom we must save from this terrible ambuscade."

Ivan made haste to obey his chief, breaking the branches that Maroussia might have a clear path; but her good friend detained her a moment to renew his directions.

"Be careful, my child; notice well the road, the field of wheat and the footpath across it; drop the two crowns upon the little bridge, move quickly on to the wood on the left, the man and the handkerchief. Now make haste, dearest child; here is the handkerchief."

Maroussia leaned forward, presenting her forehead to the great friend for an adieu. Tchetchevik was weaker and more entirely disabled than he had supposed, and the effort to give directions to the child caused him great pain and loss of blood from his wound. The child saw it and with ready sympathy begged to be allowed to bandage his arm, saying, "You know the beautiful Mephodievna made of me a good hospital nurse."

"No, no, Maroussia, be reasonable; I have gone through the whole war without a wound until now, and this sword-cut upon

my arm is nothing. We can not expect to be fed upon dainties and repose on beds of flowers in such times. Go now, we are wasting time. But stop a moment. Let me arrange this handkerchief upon your pretty head; it may be seen at a greater distance and more readily; besides, it is very becoming to your blonde curls." And with a trembling hand he arranged the handkerchief on the head of his brave little companion and ever ready aid. Then promising to rest quietly until she returned, he said, "I will see you again very soon; you know well, my child, nothing can separate us. Now go, fly, if it be possible, and forget every thing except that you are acting for Ukraine and for *your friend*. The little handkerchief will always speak to him of thee."

Maroussia started with the speed of a gazelle. She saw no one on the border of the forest. The firing which they heard a few moments before had ceased. Thinking no longer of any thing save obedience to the orders received, she has passed the wheat field, stopped for one moment upon the little bridge to deposit her garlands, when a dull noise strikes her ear, and presently a horseman appears. Is he friend or foe? Cossack or Tartar? If her eye did not deceive her he was the latter and must be avoided. Looking back she said, "Half is accomplished, I will wait a moment," and instantly she endeavored to conceal herself behind the trunk of a projecting tree; but scarcely had she taken one step towards the tree when the report of a gun was heard. The red handkerchief and the beautiful head which it covered had fallen into the dew-laden grass beside the bridge. The Tartar soldier stopped one moment to see what his ball had struck, and saying, "'T is only a child, and the red handkerchief is of no value—not worth picking up." Soon he had disappeared in the darkness, disappointed in what he had expected to effect.

All was silent for a while, but presently a peasant, laden with a bundle of fagots, came out from the little wood which Maroussia ought to have reached. He walked slowly, as if waiting and watching for something. The two crowns attracted his attention. He picked them up, and then, as if weary, seated himself at the foot of the tree near a parapet of the bridge, and mechanically looked about him. What is that? At first sight it seemed but a bunch of scarlet flowers, but looking closer, he discovered the body of the little girl. Now the light of the moon fell full upon her. He looked with pity upon the pale face of the child, and raising the inanimate body in his arms, he removed and laid it tenderly on the brink of the rivulet, making the sign of the cross over the brave little heart whose pulses were stilled forever, pronouncing the words, "May God be merciful to you," to which the little girl could not now reply, "God has helped me." Then forgetting his bundle of fagots, but carefully preserving the wreaths of flowers, he ran quickly forward, repassing the bridge and pressing earnestly into the little wood beyond. What was it he held so closely concealed in his hand and pressed against his heart? It was the little red handkerchief taken from the blonde curls of the child who loved her country so well. The little red signal has reached its destination—Maroussia has fulfilled her mission and the few faithful ones are saved.

These things happened long, long ago; but upon the incidents a legend is founded, and to-day is still shown upon a hill, made by the hand of man, a beautiful cross of rose granite. Upon this cross, engraven with the point of a sword, is simply the name "Maroussia." The hill is called a Kourgane—the Tomb of a Little Girl. It is covered with a splendid carpet of verdure and sown thickly with beautiful and fragrant flowers which have never been found elsewhere. They resemble the starry, violet eyes of a beautiful child. When transplanted they refuse to grow, and the children call them only "Maroussias." They relate a story of a famous Cossack, remarkable for his courage, beauty, and goodness, and still more for his love of country, who raised this mound of earth to the memory of one he loved. He had lost an arm in the last conflict which gave independence to Ukraine, and with his remaining hand he had constructed this monument. Many

years passed while he was engaged in the work. Young when it was begun, his hair was white with age when it was finished, and when nearly completed they say a youth called "Tarass" begged to be allowed to assist him, and his prayer was granted. At last the kourgane was finished and surmounted by a cross visible for miles around, and then the lion-hearted Cossack sat down at its foot and forever mourned his loss, and from the tears wrung from his broken heart sprang those beautiful, fragrant flowers which refuse to grow in any other spot. To such as comprehend the language of flowers it is said they are heard to speak in the silence of evening, when the moon is at its full, softly murmuring, "We can not grow except upon the tomb of those who have given their lives to their country."

Parents lead their children, boys and girls, from every part of the country as pilgrims to this tomb, and relate to them the glorious ending of the heroic child; and not one of them but wishes to be a MAROUSSIA.

FLOWER POEMS OF THE ORIENT.

ALTHOUGH in more northern latitudes on this side the sea victory still perches on the snow-banners of insolent Winter, here in the capital, the "height of the season," so far as the plum-blossoms are concerned, has now reached its sorrowful end—"now" meaning the Ides of March. The whiteness of these fair, but fleeting flowers, covers the ground far and near in the enchanted inclosures which Eastern "love of beauty" has consecrated to the spirits of the flower race. Borne from page of Western poet, there come to me dreams of distant haunts where,

> "Now fades the last, long streak of snow,
> Now burgeons every maze of quick
> About the flowering squares, and thick
> By ashen roots the violets blow;"

where, too, the rambler may receive the tremulous benediction of

> "The sweet South
> That breathes upon a bank of violets,
> Stealing and giving odors."

Yet the exquisite, double flowers that wreathe the bough of the Japanese plum-tree, forming, in Eastern imagery, a "perfumed cloud," would seem sweeter even than "violet bank," could we but watch their yearly bloom in the lands we call home. Albeit that it is in an alien land we mark their wondrous beauty, when we stand in what is called poetically the "flower-forest" the once imprisoned souls of fragrance, free from their bonds, whisper over and over again that three immortals, color, music, and perfume are kin through all the world, and that not one of the lovely triad have ever forgotten their kinship, unlike erring mortals who often ignore the brotherhood of their own race.

The plum-tree standing without one green leaf on its lifted or its drooping boughs, each spray a mass of fragrant bloom, seems most like a goddess clothed in white sea-foam; but that is because of the oddity of our Western fancies, no doubt, for the Japanese mind sees nothing of the kind. Sadly cries the singer disturbed, as who of us has not been, by one of Spring's fantastic freaks. "I thought to show the plum-tree's flowers, when lo! thickly the snow-flakes descended till I knew not flowers from snow." This figure sufficiently common in our own literature, is a great favorite with him who dares to chant an ode in praise of the blossoms of the sun land.

Weary of the poetic monotony of snow and blossoms so often wedded in song, I once undertook to transfer the chill Winter accompaniment to some other theme, steadfastly declaring that a pure and righteous heart was like the white, unmelting snows that crown Mt. Fuji. The venerable "Utayome," Japanese versifier, to whom the verse was submitted, did not seem displeased with the liberty taken; but cheerfully revised the language, not being prosaic enough to discern the fallacy, in the thought; however, a simple query propounded to an un-

imaginative person sealed the fate of those *not* immortal lines. "Does the snow on Mt. Fuji melt in Spring-time?" Answer, "Yes." It is needless to state that thereafter the amateur song-maker meekly followed in the footsteps of the native poets as regards rhetorical comparisons. Japanese poetry has much that is arbitrary and artificial about it. The "Makura no Kotoba," or ornamental language thrown in for brilliant effect, has no real influence on the poetic idea embodied in verse. I can not forbear noting that the original meaning of the word "Makura" is "a pillow," and if the Japanese pillow, instead of being fashioned of wood were but the downy comfort our own civilized pillow proves, there could be no doubt that the so-called "pillow language" was rightly named thus, for it is, indeed, only a soft cushion of words whereon the stronger poetic lines may repose.

Pope, whose keen wit flashes into sarcastic reproof of the "tuneful fools" guilty of verse where "expletives their feeble aid do join," would here have found his "occupation" of critic "gone," in that respect, seeing that much of the beauty of a poem is concentrated in its wording—meaningless or otherwise. With my present opinion, subject to future revision, if need be, frequent poetic explorations harmonize and show that words not ideas are the main pillars in the Japanese temple of poesy. However, from the midst of unmeaning, literary ornaments, and sweet-sounding words, one may occasionally gather a jewel thought fair enough to match with those that form the wealth of Western literature.

Certain beautiful things are always found associated together in poetry. The plum-tree and the nightingale are twain in the song world, and no poet dreams of giving the warbler a resting-place on the bamboo or the maple, or even on the matchless "Sakura," the Japanese cherry. With this last the name of the pheasant is indissolubly linked, and the fair plumage of the bird is certainly worthy to repose on the scented boughs of the tree, or as Asiatic fancy would phrase it, to "dally with the odorous blossoms," and bear away their fragrance. No Japanese singer could venture with any show of truth or even any semblance of poetry to call the feathered denizens of his native groves "incarnate songs," though he might, perhaps, dare, defended by the rhetorical license of his guild, to name those which love to nestle among the blossoming trees, winged perfumes. Here is a specimen of the perpetual "harping on one string" of which the Asiatic muse shows herself capable; as, however, American ears have but seldom listened to her oft-repeated strain, it may not weary them, as it does those who live nearer to her tuneful throne:

"Close by my dwelling,
Softly are swelling,
Buds into flowers,
First flowers and fairest,
Snowflakes in seeming,
Touched by the gleaming
That falls from the sun,
When daylight is done,
O Plum-tree, thy branches
No longer are snow;
And yet in the night-fall,
They glimmer and glow,
Till scarcely I know,—
Whiteness and brightness so strangely are blended,—
Whether or not the fair moon hath descended,
Shining below."

From the early blossoming plum we come to the later bloom of the "Sakura," Queen of Beauty, in the realm of flowers. With a blush on her delicate blossoms, that seems like the *dream* of color rather than its reality, she vindicates her claim to the same place in the Japanese heart that the regnant rose holds in our own. Spite of the introduction of foreign floral beauties, the people at heart still remain loyal to their "first love" among flowers. Even the great "rose mania" which, some time ago, swept over them, reminding one somewhat, in its fervor, though not in its folly, of Holland's olden "tulip mania," never gained sufficient strength to enthrone the garden queen of the West as permanent ruler over the flowers of the East.

The poems in honor of the Japanese cherry, could they but be manifested to the gaze of the curious, would lie—

"Thick as autumnal leaves, that strew the brooks
In Vallombrosa."

Could but the soft Italian sounds of much

of the poetic language used in its praise be transferred to our more rugged tongue, the reader would be charmed with their sweetness. See the bloom-laden boughs in the "red glory of eve," rocked by winds that are hushing themselves to rest, and deny, if you can, that they are a whirling "eddy of bloom," or, fancy, if possible, the cherry-blossoms, stirred by a wind so soft that they seem touched by "a zephyr that blows not." The mountain "Sakura" has its share of poetic honor as well as the carefully tended pride of the garden. It is compared in its far-off beauty to the white clouds that girdle the rugged peak, or, if here and there, its delicate flowers light the Spring landscape like scattered "flocks of cloud," the poet sees the fringe of bloom along the hill-side, and declares that they are so like snow-flakes he half mistook them.

One distinguished song-writer breaks forth in enthusiastic verse, somewhat in this wise,

"Softly, O! softly, the Spring airs are blowing,
Golden and glad is the sunbeam a-glowing,
Fragrance, attended, and beauty bestowing,
Cometh the goddess of Spring to her bowers.
Bursts from her heart, in a billow of perfume,
Blushing and blooming, the Sakura flowers."

This rhapsody probably afforded the author signal relief, even as the Spring effusions which inundate the waste-baskets of editorial sanctums remove a dangerous pressure from the brains of writers less known to fame than this slant-eyed poet.

While the pen of the Eastern poet figuratively runs wild over mountain and valley where blossom the fair favorites of Spring, plum and cherry, yet this same winged Mercury sometimes deigns to touch lightly the more unpretending flowers that cluster on grassy banks, or hide beneath the shadow of tall ferns and grasses.

Although there is no peasant poet to sing of the daisy, that

"Wee, modest, crimson-tipped flower,—"

yet the violet, so much lauded by our own singers, has its modest share in the divine honors paid to "Sao-Heime," goddess of Spring. However, as the finding of a sweet-scented violet is full as difficult a task in Japan as that of securing the prize of "four-leaved clover" in lands beyond the sea, one can readily perceive why the "violet-song" haunting these woodlands loses much of the subtle sweetness which breathes through the notes when a Western poet chants its praise.

One might search through a cycle of Eastern Springs, but all in vain, for a verse so charged with perfume, that fancy drinks in half-unaware the fragrance of field and forest. Here we do not

"Know a bank where the wild thyme blows,
Where oxlips, or the nodding violet grows,
Quite overcanopied with luscious woodbine,
With sweet musk-roses and with eglantine."

After Shakespeare has spoken it seems idle to crave a hearing for the simple song of the Asiatic poet, which does homage to the "nodding violet:"

"To-night will I slumber
Till blushes the sunrise,
Then, rising will stray
Where violets grow
In their purple array.
I covet them so,
My footsteps shall follow
The smile of the flowers,
'Mid grasses encumbered
By dew-drops unnumbered,
O'er moorland and fell,
Thro' blossoming dell,
Unheeding the hours."

The "Fukujuso" (*Adonis Sibirica*), a tiny, golden flower of early Spring, may, perhaps, be said to take the place in Japanese literature which the buttercup holds in that of the West; yet is the latter a nodding, laughing coquette, while the former is a sunny-faced prophetess, who tells the credulous seeker, by her late or early blossoming, whether the year will bring foul or fair fortune.

The morning-glory, drinking in the dew of early day, brightens some rude, moss-grown wall, or covers with its graceful flowers and foliage some hardier woodland growth, thus becoming in the wild-wood as well as in the garden a teacher to the Eastern poet of mortal frailty. He reads the legend, "We all do fade as a leaf," on the swiftly withering flower of early morning. His apostrophe is, indeed, more truthful than poetic when he cries:

"Frail generation of the flowers,
How brief the shining of your hours!

And yet, like us of mortal breath,
Ye quail at swiftly coming death.
Have ye not hidden from the glare,
Beneath your leafage green and fair,
Some bloom that seeks of dew and air
A longer grace?"

From the flower sacred to the dewy hours of early day, and shrinking shyly at the warm breath of the sun, we come to the glorious Fuji, the wisteria-vine, whose pendent flower-clusters, when their beauty is twined and intertwined with the tall pine, seem, poetically speaking, like purple "waves that fall a-down from heaven." Spring is said to be given over to the rule of the radiant wisteria, which "runs hither and thither in its overflowing bloom," amid the trees of the grove a "rippling wave" of beauty; but should it bend to dip its fairy blossoms in the waters of some pool it would then become a glowing "cloud of purple." As you wander along some fair reach of shore where it grows in luxuriance, you may see how,

"Mirrored deep in the dark sea-bowers,
The shimmering waves of the fuji-flowers,
Airily flow,
Blooming above,
And shining below."

Space does not permit me to cull at any length the poems which do honor to the exquisite bloom of the "camellia," which sits like a queen enthroned among its glossy leaves, bidding defiance even to the chill breath of December. A certain poet says of the white camellia, the serene St. Cecilia amid the bright band of her sisters:

"In the heart of the white camellia-flower,
Nestling low,
Is a drop of dew that may have shone
First in the ages long unknown,
Eight thousand Autumns ago."

The crysanthemum, or "kiku," with its many-tinted blooms, brave and fair even amid snow-flakes, would form in some sort a poetic representative of immortality, did the Asiatic poet seek for such. We do not find in his verse, however, the intense yearning for immortal life which breathes from the songs of the Anglo-Saxon master of poetry. He appreciates fully the beauty of the Japanese "kiku," though not as a spiritual emblem, revering it as the flower-symbol of his nati e land, the crest of her imperial rulers for ages, befitting those who claim descent from the immortal gods.

Surely, that *pearl of chrysanthemums*, the white-flowering variety, is fair enough to weave about the brows of the brightest god or goddess in the Pantheon, whatever we may think of the more brilliant and earthly of these Autumn glories. The song-maker, looking doubtless from his open door upon "the clear, cold heaven," prepared to shed on leaf and bloom the keen whiteness of the frost,

"As falls the plague on men,"

wreathes a tribute with which to crown the snowy "kiku." Of more fragile blossoms it is true that soon will

"The brightness of their smile be gone
From upland, glade, and glen;"

but not so with the enduring loveliness of the flower whose praise he sings:

"White as the hoar-frost down from heaven,
Glimmer the moon-beams light,
White as the hoar-frost 'mid the leafage,
Glimmers the kiku bright;
The breath of the Winter is keen and cold,
But her Autumn beauty is not yet old;
So the moon shines on in the heaven above,
And the kiku gleams with her vestal snow,
In the world below."

Passing from the chrysanthemum, with its sweet lessons of patient endurance, I can not refrain from asking the reader to linger for a moment over a song of consolation, which, though evidently written in the flush of Spring, has an under-thought fitting, whether the poet meant it so or not, all seasons of all years:

"Heavily hover the mists of the Spring-time,
Circling my dwelling, fold upon fold,
Yet 't is not only the mists that have found me;
Close by my side and above and around me,
Fragrance and song like a rainbow have bound me.
What though the vapors are sullenly glooming,
Nightingales warble and flowers are a-blooming."

Though the hand that penned these lines is the hand of an alien, yet the voice is the voice, less sweet, it is true, of our own tender singer:

"Be still, sad heart, and cease repining,
Behind the clouds is the sun still shining."

As you enter fairy-land, embodied in the miniature landscape of some Japanese garden, with its wealth of fantastically shaped trees, brilliant blossoms, and flowering vines,

with rock and shrubbery-crowned mountain and silvery lake, there greets your eye something fairer than art linked with nature can create. Smiling upward from the shining surface of some pool, white and rose tints meeting on its great, wide-open petals, or hidden in the close beauty of its bud, blooms the sacred lotus, fitly named by Bayard Taylor, "Empress of Flowers."

When greatness arises from obscurity, or righteousness from unrighteousness, the Oriental has ever one parable upon his lips, "It is even as the lotus-flower, which springs from the mire." Perpetual emblem to the pagan heart of purity, recalling that heaven of his faith, where Buddha, "with calm, eternal eyes," is seated upon a lotus-bloom, poet might almost dream that a religion thus symbolized could uplift the fallen. But alas! had the banished Peri plucked this fairest among lilies in her weary quest for a talisman potent to open wide the gates of Paradise, even the magic of its purity could not have availed for her. Yet its serene grace is allied in my thought with the fabled loveliness of

> "The lote-tree springing by Allah's throne,
> Whose flowers have a soul in every leaf."

It may be that this song-tribute to the sacred flower, last and most cherished in my wreath of Oriental floral offerings, is the link which connects its beauty with the wondrous tree of Mahomet's paradise:

> "List, while I sing thee a song of the lotus,
> Softly and slow,
> Calm are the waters that cradle its leaves,
> Calm is the lotus, nor murmurs nor grieves;
> Never below;
> But ever above,
> Smileth her face like a vision of love.
> Stainless and pure from the mire at her feet,
> Flower of all flowers, she is peerless and sweet.
> Trembling glitters a gem on her breast;
> Is it a dew-drop or is it her soul,
> Shining a symbol of heavenly rest?
> Fair is the jewel, whatever it be,
> Fairer is she."

SOUTH AFRICA.

NO country to-day awakens greater interest or enlists a warmer sympathy among men than does Africa. Her northern shores involved in the tales of mythology were known to the ancients for centuries, while as late as the fifteenth century only six hundred miles of her western coast below the Straits of Gibraltar had been navigated. From that time commenced the career of discovery by the Portuguese, and ninety years later Vasco de Gama completed the circumnavigation of the whole African continent. The latest prominent and world-wide interest, however, has recently centered in South Africa.

Damara Land, Cape Colony, and Namqua Land bordering on the Atlantic Ocean; Natal, Kaffraria, and Zululand on the Indian Ocean; and Transvaal Republic, Orange Free State, and Bechuana, in the interior, comprises South Africa proper. The successive ranges of highlands, which rise at intervals into great mountains, the highest of which have an elevation of ten thousand feet, are the leading features of the geography of these provinces. The terraces lying between these highlands have their own peculiarities of soil and climate. There are few rivers, as the streams are mostly mere torrents which leave deep and dry ravines in the seasons of long droughts.

The Orange, the only river of much size, flows into the Atlantic Ocean and forms the northern boundary of the Capelands. As most African explorations have had for their object the discovery of river sources, the explorers have usually kept close to the rivers whose origin it was their object to discover, and have waded or floated quite as much as they have walked. Livingstone was said by the natives to have been afflicted with "water in the head," so persistently did he search after water sources and courses.

The climate of Southern Africa is mostly tropical, and though occasionally humid, it is healthy. The Summer, beginning in October, continues until the end of March, and June, July, and August are the Winter

months. The entire country up to the Zambeze is equally rich in mineral wealth and in the productiveness of its soil. Parts, however, suffer from want of water, and agriculture is somewhat restricted. Large tracts are available for pasturage, and stock and sheep raising are largely carried on. Mr. J. A. Froude says of South Africa that both for climate and natural capabilities the country is unmatched in any other part of the world. In saying this he does not speak of the enormous mineral wealth which it contains in coal, iron, copper, gold, and precious stones, but only of the productiveness of its soil.

The zoölogy of this portion of the country corresponds to that of Africa generally and is richer than any other part of the globe. It has five times as many species of quadrupeds as Asia, and three times as many as all America. The most beautiful insects, the hugest reptiles and the lordliest of brutes abound.

The lowest and meanest of the productions of South Africa are relatively its human inhabitants. With exceptions, says Dr. Bartlett, the races seem best fitted to show how nearly a man may sink to an animal. Nothing is too low for their worship. Slavery is the most ancient inheritance of the country. Polygamy of the lowest, loosest kind is universal. The races include men of all shades of color, from light coffee and copper color to jet black, with hair both straight and woolly, and with the facial traits of the European as well as of the negro. Throughout the country "dress is generally conspicuous by its absence." A small cloth or its substitute of skins or grass is all that is worn by the highest as well as by the lowest of the people. Human nature manifests itself in the African as well as among more civilized peoples. Their great desire is to be well dressed, in their point of view, in the eyes of their friends. Both men and women tattoo, but the latter give up the greater portion of their time to it. The different tribes are distinguished by their figuring, no two tattooing alike. The ears also are pierced in several places as a mark of great beauty.

In 1486 Bartholomew Diaz discovered the Cape of Good Hope, and although the place was frequently visited by English, Dutch, and Portuguese navigators, it was not until the seventeenth century that the first colony was established on the Cape. The Dutch founded it in order that their vessels might stop for repairs or supplies on long voyages. The growth of the colony was slow, as there was nothing to attract emigrants in large numbers. The area of the Cape Colony is estimated at one hundred and eighty-three thousand two hundred and eighty-six square miles. The whole country consisting of three great plateaus, forms belts of fertile land, which are covered with rich vegetation and which are intersected by three mountain chains. The vine is largely cultivated in Cape Colony, and good growths of wine are produced. The flora comprising most European flowers is in repute for its variety and beauty. The colony contains over three hundred thousand white inhabitants and about half a million of blacks. The aborigines are known as Bushmen, a badly fed tribe, living on small ground animals. Small, black, oblique, almost Mongolian eyes, a broad, flat nose, yellow skin and high cheek-bones distinguish his features. His physique is small, his height being little more than four feet, and his small but long skull is ornamented with twisted knobs of hair on the sides, while the center presents bare spaces.

The peculiarities of his language are the many signs interspersed which are requisite to its meaning. In the dark the language becomes unintelligible, and at night when Bushmen would converse they are compelled to collect around their camp-fires.

Early in the present century Cape Colony came into the possession of the English, who used it as a place of exile for their convicts until the penal colony was established in Australia. Since then it has greatly improved, and this colony, formerly the key of the Indian Ocean, is the station of both a large military and naval force, though by the opening of the Suez canal its political importance has been greatly diminished.

The Bechuanas, a powerful and intelligent

race, are divided into a number of tribes named each after a certain animal, a custom probably originating with the animal worship which formerly prevailed among them. Their profile is hideous, and their foot is so singularly formed that they can be known by its print. Their complexion is sallow and much resembles that of the Chinese. As a people they are quick-witted and eloquent, but vindictive. Their language is as singular as their appearance, the striking peculiarity of it being a curious cluck, compared to the clucking of a hen. Gardening and agriculture are much practiced by the Bechuana women, while the men occupy themselves in war and the chase. Very vague ideas of any kind of a deity have these Bechuanas. They attribute all evil to an invisible god called Murimo, and never hesitate to show their indignation at any ill experienced or any wish unaccomplished by most bitter curses. They have no other thought of the cause of death than that persons die from either hunger, violence, or witchcraft. If a man die at the advanced age of ninety, not from hunger or violence, his death is attributed to sorcery, and blood is required to expiate it.

Damara and Namqua Lands are quite thinly inhabited by rude pastoral tribes, who go about from place to place to feed their numerous herds of cattle, which form their chief wealth. The Damaras are supposed to have emigrated within the last hundred years from the interior of Africa. They are constantly at war with the Hottentots, the natives of Namqua Land, who are supposed to be the oldest people on the South African Continent. Among the evidences of this is the fact that the rivers even in the Bechuanas territory bear Hottentot names. Rev. Henry Rowley in his "Africa Unveiled" says that when South Africa first became known to Europeans the Hottentots occupied most of the districts now included within the colony of the Cape. By the encroachments of the Kaffirs they were dispossessed of much of their territory, and by the cruelty of the Dutch their numbers were greatly reduced. Considerable numbers have migrated towards the north, and have established themselves in that most sterile of all the cape districts, known as Namqua Land. Kraals or villages, consisting of a number of circular huts like beehives, are the homes of the Hottentots, who in disposition are friendly, good-natured, true to their promises and quick to feel gratitude. They are, with their neighboring tribes, the victims of the superstition of witchcraft. Storms can be driven away by shooting poisoned arrows at them. Like the Bushmen, the Hottentot is scarcely more than four feet in height, a low physical type almost necessarily resulting from so thin a population as four persons to the square mile. The Namqua language is an interesting study in itself on account of its remarkably simple and yet comprehensive and expressive structure.

The Portuguese in 1498 discovered the province lying between Zululand and Kaffraria. Disembarking on Christmas day they gave to it the name of Tierra de Natal or land of the Nativity. Natal contains some twenty thousand Europeans and four hundred thousand Zulus. It is a mountainous country and abounds in rich agricultural districts. The surveyor-general says that if properly cultivated Natal would support sixty millions of people.

Far away behind the mountain ranges to the north-west of Natal and Zululand extends the vast upland plain of the Transvaal, a country measuring about four hundred miles each way, adjoining the Orange Free State. Both the Vaal and the Free State are independent and are inhabited by negro tribes and Dutch Boers or farmers. Together they have a population of one hundred and seventy thousand. Rev. G. Bencowe assures us that the Transvaal is a most important tract of country. Its agricultural capabilities are greater than any other portion of Africa. Its mineral wealth while unknown is believed to be exceedingly great. Gold is found there as well as copper, and it is stated that lead and silver abound. The iron of the Transvaal surpasses any European iron. There are whole mountains of magnetic ore so powerful that the theodolite of the surveyor becomes useless and his

watch becomes so affected as to be of no service. The grain-producing districts of the Transvaal are large and numerous.

The typical African adventurer is the Dutch Boer, and it is difficult to conceive of a rougher or more perilous life than his. In 1650 the Boers founded their principal settlement, which, in 1806 was taken away from them by the English, in whose possession it has since remained. In South Africa the Dutchman seems to have changed character. The home-bred Hollander is slow to bestir himself, while the African Boer is restless and impatient. He has a mania for running up houses in the wilderness, and then on the slightest provocation abandoning them. So nomadic in his instincts has this Boer become, Mr. Aylward says, that even when permanently settled in villages he still sleeps in his clothes; while he never dreams of indulging in the luxury of candles, but turns in with the setting sun. He leads a life of constant excitement and anxiety from the fact that his supply of water may cease at any moment. Even in normal seasons the wells and water pools lie far apart and are apt to give out, while in the droughts, that are sure to be of periodical occurrence, whole districts are dried up and the pasturage is scorched into tinder. There are certain features of the domestic life and social customs of the Boer which are interesting and amusing. He measures land by the primitive method, namely, as much as a horse will walk round in a given time. Accordingly fast walking horses are in great demand, and are sometimes sent for a hundred miles or more to be used for this purpose, the owner of such an animal making considerable sums of money by letting it out. The education of the Boers is extremely elementary, and they are opposed to any improvement in that direction. The Bible constitutes the family library, and in their conversations and discussions they frequently express themselves in language resembling that of the Old Testament and make use of examples and quotations from it. In his manner of living the Boer is simple, and is utterly regardless of cleanliness or comfort. He, with his family, make their home in two small rooms, one of which serves as the parlor and kitchen, the other being the general sleeping room. Provisions, in the shape of dried hides, sour milk, and slaughtered buck, may be seen hanging from the rafters. The cleansing process in the morning is carried out by all the family; the seniors, commencing, are followed by the others, and the one basin of water and the one towel answer for all. The men sit down to the tables together, while the women wait upon them; the latter not commencing their meal till the former have retired.

The modes of traveling in Transvaal, Natal, and Orange Free State are either by ox-wagons, on horseback, or by carts. The cart is a vehicle placed upon leathern springs, and capable of conveying from two to six persons. It is covered with double duck canvas, having a space between to protect against the heat of the South African sun and to allow a free current of ventilation. The front seat is provided with a chest, upon raising the lid of which is disclosed an arrangement of shelves and partitions, fitted up for the carriage of a complete set of culinary implements and of a lot of provisions, so that after driving as far as you choose, in the absence of a Boer's house, according as you find water, you may draw up, outspan your horses, knee-halter them, and send your Kaffir for some water, and proceed to prepare your dinner.

Wooded mountain slopes, fertile and well watered valleys, make the province of Kaffraria an exception to the usual dry and bare character of the South African countries. Kaffir-land is the most beautiful part of South Africa. The history of this territory, and, indeed, of the entire colonial border, is a record of Kaffir wars, inherited by the British Government from the Dutch colony and continued from 1809 to 1834 and following years until 1853, wars in which millions of English money were expended and in which thousands of lives were lost; and which finally ended in the placing of the Kaffirs more or less formally under colonial control. The Mohammedans gave to this tribe the name Kaffir from the Arabic Kâfir, an infidel, on account of their

refusal to adopt the religion of Islam. They are reckoned with the Zulus, and are a noble race physically and mentally. No African race surpasses them in nobility of form and intelligence and mental capacity. Their body, instead of being as that of the Hottentots and Bushmen, diminutive and feeble, is muscular and athletic, and the stature is equal to that of the European race. In the useful arts they have made considerable progress. Besides domesticating the ox and sheep they have also tamed the horse and goat. The Kaffirs are a logical people, acute in observation and patient in argument, They are passionately fond of music and possess considerable talent in acquiring tune and appreciating harmony.

In the south-east of the continent is Zululand. At present it means the district north-east of Natal, beyond the Tugela River. The history of the Zulus, or Celestials, as the phrase means, commenced, so far as is now traced, with their chief Chaka, whose genealogy any known tradition does not carry beyond three or four generations. Chaka was born about a hundred years ago; so that the history of the Zulus is embraced in the period of our constitutional government. He was a marked character. Few such arise amongst any people, and it is quite certain that he has had no successor equal to himself, not excepting him who has proven himself so surprising a competitor with British arms within the past year. One of the curiosities of history is the death of the young Prince Napoleon at the hands of the army originated under this man, Chaka, who, history tells us, after learning all the arts of Zulu warfare, hearing from some English soldiers of the exploits of the first—the only—Napoleon, resolved on becoming the Zulu Bonaparte. Military ambition and conquest at the cost of any number of thousands or even hundreds of thousands of lives seized the African chieftain. When his old father Usenzangacona died, Chaka was only twenty-five years of age. Fifty years ago, more or less, he came from the north, and swept the country from where Livingstone entered Africa to the northern lines of Cape Colony south, conquering tribe after tribe, and incorporating all into his own. The chiefs who early pledged their allegiance to Sir Garnet Wolseley were probably those who were unfortunate in battle, and to avoid death at the hands of Ketchewayo submitted to the British, for it is an old policy adopted from the first famous African Napoleon to compel men to conquer or die. It was Chaka's well-understood policy in the event of his soldiers being conquered in war and returning to himself to have them killed. A further refinement of his administration finds its illustration in an instance when his troops having returned from a campaign unsuccessful but reduced by disease and famine, Chaka found his blood-thirsty disposition drawn out to punish them by putting their wives to death—three hundred daily until two thousand were massacred. This exploit cost him his throne and his life, which he lost at the hand of the assassin in a tragedy planned by two of his brothers, whose wives he had thus destroyed. Fourteen years of bloody life number the strange career of this African Alexander, who died only seven years older than him of Macedon, but who made a record which is the pride of all his tribes to the present hour, and who made the Zulus pre-eminently a military nation. His motto through life was "Thorough" in the work of violence, cruelty, and rapacity; and by his name the Zulus still take oath, and his war-songs have become their national anthems. Chaka had two brothers, who, having disposed of him, fought a duel to determine who should become his successor. The crown fell to Dingan, who was more cruel, more savage, if possible, than Chaka himself. He, in turn, was killed in his own camp by treachery, and his brother, Umpande, became king. At the beginning of his reign the British Government took from him the southern part of his territory, with about three hundred thousand Zulus, leaving to the chief the northern part with an area of about two hundred miles north and south by two hundred east and west, with about an equal number—three hundred thousand—of Zulus under his rule. The Zulu dynasty to which Ketchewayo has suc-

ceeded is, therefore, in all its history a military and a bloody one.

Ketchewayo was placed as the successor of Umpande, and, though a half-naked barbarian, who can not read nor write any more than could some of the Norman kings, is, according to Sir Theophilus Shepstone, a man of considerable ability and much force of character, who has a dignified manner, and in all conversations is remarkably frank and straight-forward. Yet like that of his uncle Chaka, Ketchewayo's fame rests upon his cruelties and his murderous deeds, and much of his time has been spent perpetrating acts that show a combination of all the bad traits of his predecessors. During his rule missionaries, permitted in the country under Umpande, were driven out, and all converts killed. The wholesale massacre of the young women of his people who objected to his order that they should marry no one who had not passed considerable of his life in the Zulu army is another of Ketchewayo's bloody acts.

The Zulu Kaffir is a man of great force of character. Foremost among his prominent qualities is his abounding cheerfulness. The slightest occasion will provoke his laugh. Whatever his work may be, he is always ready to lay it aside for dancing and singing, laughter or play. He is social and extremely polite, scrupulously honest, and has a correct sense of justice—hospitable and sympathetic. The Zulu women perform most of the agricultural and industrial labors of the country. The men do the tailoring for themselves, milk the cows, which task is esteemed a recreation, the practice being to suck the cow's udder with the mouth, and to discharge the milk by mouthfuls into the pail. They lounge, drink, smoke, and when food is plenty, gorge like boa constrictors, while the poor women with their pick-axes and baskets must serve as plows and carts, horses and oxen, corn-planters, grist mills, and cooks. Both the men and women are excessively fond of ornaments. Beads of divers colors are the chosen article for decoration. Sometimes the entire person is well-nigh covered with them. A string of beads across a man's nose and over his eyes like a pair of spectacles causes supreme happiness. The women frequently undergo bodily pain to improve their looks. A cluster of scars may be found on their arms or other parts of the body, where the skin has been cut or burned for the purpose. The doctor is called in for the express purpose of making little gashes over the body, which he fills up with a mixture supposed to be the powdered bones and ashes of a snake.

In common with other tribes, polygamy obtains, the only limit to the number of wives being the disposition and ability of the husband to purchase them. The father, as he looks upon his daughters, thinks of them chiefly in reference to their marketable value. They are worth to him so many *head of cattle*. With the price which he receives for his daughters he expects to purchase other wives for himself; so that a man's social standing depends largely upon his wealth in women. When a girl becomes marriageable the highest bidder is generally regarded as the most eligible suitor—no matter how many wives he may have already, or what may be her feelings toward the prospective husband. Forced marriages are of common occurrence. Yet sometimes it happens that marriage takes place with the full consent of the female, especially if the age of the intended husband is at all proportionate to her own. Matrimonial affairs in Zululand are not peculiarly poetic.

It is needless to say that a tribe like the Zulus—that any African tribe, indeed—is superstitious. The visit of a turkey-buzzard or its entrapment, also of a hawk, brings ill-luck. The cattle will sicken or die if a cock crow before persons retire in the evening. A leopard's whiskers pounded and mixed with food will make a man courageous. Dangers and sicknesses are warded off by wearing a string of roots, herbs, bones, claws, hoofs, and horns around the neck. Metempsychosis enters somewhat into a Zulu's belief. After death the spirit may go into a snake. Chieftains may reappear in daring animals, like the elephant and lion. Hence ancestral worship enters into a Zulu's cult, and Chaka, the great warrior, like Nimrod of old, having passed away, becomes a god. To Zulu

superstition the Imperialists of France are indebted for the preservation of the chain, crucifix, and other relics worn by the Prince Imperial, which were found intact when the otherwise stripped body of his imperial highness was discovered. The witch doctors attached to the army of the savage king carried their magic medicine around their necks, and it is believed that they entertained a superstitious dread of touching the trophies, believing that they contained a certain magic power, which might effect the destruction of any one meddling with them.

Dr. Mann, in his "Colony of Natal," says that "In the Zulu country it is believed that immediately after the decease of a native, witches or wizards (*abatagati*) hunt for the body for the purpose of employing it about some demoniac work, and that they use leopards and wildcats to assist in the search. According to this superstition, when a body is discovered it is immediately 'physicked' until it is restored to life! If the wizard is caught in the act of restoration and interrupted in the work, the half-restored individual returns to life as a half-witted, stupid being, but if the restoration has been complete and the tongue has been properly cut, it becomes at once a specter or hobgoblin (*umkovu*), and is sent to join the *umkovu* band until the wizard, to whom it is indebted for its renewed existence, shall need it for 'goblin employment.' Under the direction of the wizard the specter goes in the dead of night to the neighborhood of some native village and utters in a gruff, unnatural voice the ominous sound, woe! woe!! (maye! maye!!). The maye is thought to be the death doom of some one; and when it is heard the inhabitants of the village remain terror-struck and motionless. Wild animals are supposed to be sent by these wizards on their mischievous and malicious errands. Should a leopard, for example, come at night and take from the fold of some credulous native a calf or goat he would very likely lay his misfortune at the door of witchcraft. The dreadful power of these wizards, it is supposed, is also exerted in other ways. A missionary speaks of a man who was wounded in a general hunt by a spear which severed an artery, and this accident was attributed to the influence of some wizard. The same missionary tells of another man who, going through a dense bush, had his face severely scratched, and this was attributed to the same cause. So, oftentimes, cases of death occurring from obvious natural causes or accident are traced to the supposed power of this dreaded class of men. No one openly avows himself an *umtagati*, but practices his black art with all possible secrecy."

These strange people have by the events of the times been thrown into the foreground of thought among civilized and some savage nations. The ambition of Chaka, which Ketchewayo inherited, to be a Zulu Napoleon, as in the case of his exemplar, has confronted the British Government, which has now translated this other—this ruder Bonaparte—to an ocean island, and made Robber Island, the "sanitary retreat for decayed and deposed African potentates," the home of the Zulu Napoleon. But the cattle-loving, kraal-building, superstitious Zulus will not be quiet because their chief is chained any more than was France in other years. Secocoeni has seized the fallen crown, and, aided by interior tribes, by Basuto, and possibly by dissaffected Boers, may yet show that the prowess and the power of the Zulus did not depart with Ketchewayo.

The Zulu but represents the irrepressible conflict. The red man may melt away before the white man; the Maori, the Tasmanian, the Australian aborigines may be unable to stand along with him, but the African for a hundred years to come is destined to no such decline. He ever and every-where multiplies by the side of the white man. Conquest, commerce, and Christian evangelism will compel our dealing with, living with him, and, for a long while, leading him, and from end to end Africa must be Europeanized—Christianized. Africa is the coming continent.

Well has Victor Hugo said: "Africa? What a land this Africa! Asia has her history, America has her history, Australia even has her history which dates from her becoming known to human memory. Africa has no history. She is shrouded in a kind

of legend vast and dark. . . . She is less than a prodigy, and greater. Africa is the flaming of the tropics. It seems as though to behold Africa would entail blindness. An excess of sunlight is an excess of night. Well, this terror is about to disappear. . . . The nineteenth century made a man of the negro; in the twentieth century Europe will have made a world of Africa. . . . Take it not with cannon, but with the plow; not for the sword, but for commerce; not for battle, but for industry; not for conquest, but for fraternity. . . . Make roads, dig harbors, build cities, increase, cultivate, colonize, multiply; and on that land, more and more liberated, may the Divine Spirit affirm itself by peace, and the human spirit by liberty."

ITALY IN TRANSITION.

THE liberal leaders in the Italian Parliament seem to have a hard time to understand each other and keep together; and if the papal counsels are any more stable and intelligible it is not very easy to discover it. Both parties seem to be playing a sort of game towards each other, and in addition to it to have a side play among themselves, and this latter bids fair to be the more dangerous game. Ministry after ministry rises and falls on the same issue, so that it finally ceases to be a matter of principle and becomes a struggle between the ins and the outs.

The public press of Italy is answerable for a large share of this internal antagonism on both sides. Since the fall of the temporal power and the introduction of the liberal Italian rule newspapers have sprung up like weeds. Not long since about the only journals in Rome and Southern Italy were a couple of sleepy conservative sheets like the *Osservatore* and the *Voce de la Verita*, whose only province was to announce the decrees and record the services and the pageants of the Church. And they both greatly belied their names, for the first was any thing but an "Observer," and the latter any thing but a "Voice of Truth."

Not long ago we stood for an hour one evening on the principal thoroughfare of Rome, known as the "Corso," near a newsstand (for these have already become an institution in the Eternal City), listening with amused interest at the cries of the venders of the journals as they sang out in clear Italian accents the names of the rebellious and liberal sheets of the day. The noisiest fellow of the crowd was he who was bent on selling the *Fanfulla*, that is, the "Funny Fellow," whose specialty is to mingle the gay with the grave, and treat of nearly every living subject with an air of humor, but a basis of critical sense. The people of Rome soon learned to know that the *Fanfulla* was no fool, though he appeared in the cap and bells, and it is, on the whole, the most popular sheet in Rome for the bright and lively middle classes. Then come the *Diritto* and the *Capitale* and the *Italie*, and others, ringing all the changes of the political gamut, while the Ultramontane journals are absolutely nowhere. Indeed, Leo has been so crowded to the wall by the outside press that he has at last decided to issue a veritable papal organ by turning the latter of the two above-mentioned sheets into the *Aurora*, which has just appeared under the acknowledged shield and guidance of the Vatican. Time alone will show whether the *Aurora* will tell any more reliable truth in regard to papal matters than did the *Vox* itself, but it will at least be regarded as official and considered the voice of the pontiff. As things now are it is quite impossible to know the truth of any announcement regarding the negotiation of the pope with foreign powers; and as we write these lines a protest from Bismarck comes to hand denying the report that he has had any correspondence or communication whatever with an Italian senator regarding the development of political parties in Italy. And we need hardly say to our intelligent readers that for

years nearly all that has been affirmed with regard to negotiations between the German chancellor and the Vatican has eventually turned out to be false.

The relation between Church and state in Italy is rather the relation between royalty and papacy in Rome. The ecclesiastical questions as such have not stepped out into full view as in Germany, and therefore the conservative party is not an Ultramontane party. The pope still desires to recognize no kingdom and no Parliament, as a virtual recognition would follow any entrance into the political arena of a party purely papal. The relation, therefore, between the papacy and the young Italian kingdom is a very peculiar and anomalous one. The very fact that the election of Leo XIII to the pontifical chair could take place in such security and protection as it received from the Italian Government proves that the papacy has now the protection of a stronger power than it has had for many years. On the other hand, the kingdom of Italy sees itself the bearer of a heavy charge in the papacy, which, to a certain extent, it is bound to protect, but for which responsibility and protection it can count on no gratitude from the papacy itself.

The vast body of the Italians would be extremely loyal to the pope if he would confine himself to his spiritual realm; they believe his organization a good one to have, and the most of them can have no conception of any other, and do not want the state to be without a religious power within its proper sphere. But the people of Rome very especially want no more of the civil rule of the priests, and this feeling they show in the most emphatic manner. A few years ago all the popular pageantry and festivals were decidedly and solely of and by the Church—the mass of the people were tame and uninterested lookers-on. Since the Church, in a sullen mood, has declined to continue these, the people and the state have gotten up their own, in which they take an enthusiastic interest, and in which they find an acceptable substitute for priestly shows. But when these popular festivals occur the ecclesiastics of whatever name retire to their retreats, while the royal court, the army, and the civic bodies take the place of the rulers of the Vatican and its stately train of followers.

Probably Leo XIII is more willing to conform to the force of circumstances and accept the situation than are his immediate advisers. More than most men of his position he has enjoyed an opportunity to study the art and science of liberal government, and this he has shown most clearly from the commencement of his papal rule. He was for several years papal embassador at the court of Brussels, and the king of the period, Leopold I, honored him with his friendship. The pope is still said to possess the liveliest remembrance of his sojourn in the North, and to be quite inclined to put into practice many of the lessons there learned. Catholicism in Belgium is a power, although the state is one of the first of the constitutional and liberal governments. The Ultramontane party there is just now fighting the government with great bitterness on the school question. If the Catholicism in Belgium can arrive at so powerful a development under difficulties and a very liberal government, why might not the same thing be attained in Italy with a still greater success because of the size and resources of the land, and the fact that the papacy is at home in its very midst?

The party appellations in Belgium are "Clerical" and "Liberal," and every civil conflict is now waged on that basis, and there is very little doubt but that the still active man of seventy on the papal throne is exerting a controlling influence in the struggle, although it may seem like a strife of the Belgian priests alone. The bitterness of the conflict has not yet caused Belgium to withdraw her special embassador to the Vatican, and the utterances of the pontiff towards Belgium have always been conciliatory, though, perhaps, at times not very frank. The pope sees his claims in Belgium not fully satisfied, and feels doubtless that too great concession might weaken his authority in the future, and he is trying by mild means to maintain his power rather than by the bitter and acrid conflict waged against the state by the priests.

If the clerical party in Belgium could be transformed into a simple conservative party it would be a great blessing to the land, which is now threatened with ruin by the complications occurring between Church and state. But a clerical party in Italy could hardly be developed like that of Belgium, whose small size increases the danger from the inroads of the priesthood. This may be illustrated by a glance at France on the borders of Belgium, which meets and combats the intrigues of the priests in a much more successful manner. Italy by no means affords the same field for clericalism that is found in Belgium. The sacredness of the Holy See seems to increase with the square of the distance from its sacred seat.

The kingdom of Italy has an advantage over the Vatican in forming a court in the presence of the noblest specimen of Italian womanhood. This is purely a worldly and human matter, but it is one of untold influences in the power and influence of a court. And then the papacy is of Roman origin and will ever be under the necessity of maintaining the Romish character. Italy, as a state, has no traditions, and is thus free, especially under the present sovereign, who has no obligations to fulfill towards the pope. And the influence which comes to it through its Piedmontese origin is decidedly against clericalism. The deeds of Italy since the commencement of her consolidation as a unified state are in the sharpest opposition to the papacy. The severe measures which the government was forced to adopt in order to secure a place in Rome will in time be forgotten by the people, but the measures adopted by Rome to prevent Italian unity will never be banished from the memory of Italy united and free.

The abstention thus far of the party of the Vatican from the elections of the land is a tacit acknowledgment of defeat—it is the veiled concession of the subordination of the Church to the state. This policy was necessary in the case of Pius IX, and the adoption of the same policy by Leo XIII is the simple result of the same necessity. The Romish Church can not in all matters remain independent of the state in which it has its seat, but the less it has to do with the state the more it weakens it by the mere spirit of antagonism or lukewarmness. It does not appear that Leo XIII is pleased with this policy that is logically forced upon him, nor is it probable that he will continue it beyond the period of absolute or apparent necessity. In the ordinary course of things there must be a change before long, and when it comes the Quirinal will have a troublesome factor to deal with if it has the same stubbornness and determination as the Ultramontane party in Prussia.

The greatest obstacle to the practical success of the liberal party just now is the utter impossibility of bringing the various factions together—the same state of things that so much troubles France. Their divergence is so great that they can seldom co-operate, and the fall of one ministry and the rise of another is simply the victory of one liberal faction over the other, while the conservatives look quietly on watching the chance to increase the complication by some mischievous vote with one or the other faction. And, by the way, this same statement may be said of Spain, where a great effort will soon be made to unite the factions under Castelar. With this statesman leading the liberals of his own country, Cairoli those of Italy, and Gambetta controlling all the liberal elements in France, there would be strong hope for the success of the liberal cause in Latin Europe, as one nationality would, by sympathy and co-operation, assist the other.

A still more uneasy and factious group of malcontents are endeavoring to stir up the ignorant masses with the new watchword of "Italy unredeemed." This ostensibly means Italy imperfect or uncompleted—it means that all is not yet united into one consolidated country. The cry is based on the fact that there are a few Italians yet left on Austrian soil in the city and immediate neighborhood of Trieste on the Adriatic and in the Trentino district of the Tyrol, to say nothing of a few straggling Italian elements in the Swiss canton of Ticino. But the fact is, that this device claims for Italy what in reality never was Italian. The Latin ele-

ment at various periods has had an inclination to penetrate into neighboring districts; but the Germans have always protested against it, and sometimes even to the point of expulsion of this foreign element.

The trouble with the German nation was the ugly fact that their own record was not clean, for they pressed down into Italy as invaders, and the Austrians became thus for a long period the conquerors and oppressors of the Italians. But this is now all changed, partly through former Italian alliances with the French, and partly through fortunate circumstances, so that more by good luck and happy contingencies than by any real force on their part the Italians are now in peaceful and undisputed possession of entire Italy, except a few mongrel districts that lie on non-Italian soil, and could not be incorporated without great trouble were all parties agreed in the movement. Italy can never obtain them without setting all the neighboring nationalities at odds about the matter, and they would be of little import if they were all conceded to her. Evidently the acquisition, could it be made, would not be worth the cost, and every sensible Italian knows it. But "Italy unredeemed!" is a taking war-cry for the masses, who believe what is told them by a few unprincipled leaders, who desire more than all else an opportunity to stir up and roil still more a turbid stream, so that they may have a chance of coming to the surface.

The only name of import connected with this movement is that of Garibaldi, without which the effort would be powerless to harm. But this staunch patriot has seen his best days in all respects, and with all his noble qualities has had some weak ones; these latter unfortunately seem alone to have survived, and occasionally assume activity in a most unpractical and useless way. When he was last in Rome on this errand the government treated him with great kindness and distinction, but evidently kept a close watch on his movements, and did all it could to speed the parting guest who had clearly not been a welcome one.

The cry was senseless and uncalled for, and could end in no practical result. The last outburst of it was caused by the rumor of an alliance between Germany and Austria, which in the opinion of the radical Italians would leave them no chance in the future to obtain their object. But they had never had any such chance, and they owed all that they had regained from Austria to France and Germany, without whose aid Italy would have remained in the hands of the Hapsburgs and the Bourbons. It was, therefore, well that Garibaldi advised his compatriots to remain quiet and wait for a chance before striking a blow.

Italy and Germany have a common task in opposing the papacy and their combined operation is highly necessary in the future. The most sensitive of duties in a nation as in individuals is that of gratitude, a gift not strongly marked in the present race of Italians towards the Germans. It was the German victory at Sedan that gave to the Italians their own at the gates of Rome on the 20th of the same September, and the Italians might much better celebrate the former than the latter. The cry of "Italy Unredeemed" is the watchword of a faction rather than of the conviction of a party, and still it gives a key to the Italian manner of viewing the situation. The inconsistency of it is patent in the fact that it is not extended to Savoy or Nice, both of which provinces were till recently in the possession of the Italians and were taken from them by the French. It would be necessary to make Southern Tyrol Italian before it could be incorporated with Italy, whereas, those provinces are pure Italian and will remain so. They were filched from Italy as war prizes to adorn the brows of the Napoleonic invaders, and the redeeming quality of the action is the fact that they are French now and not German, Latin and not Germanic.

The Italians would be more likely to be quiet on this question of taking Southern Tyrol and Trieste if they knew the feeling they would stir up in Germany. This is no time to talk of reducing German territory. The Teutons know their power and are quite determined to maintain it. The consolidation of the Germanic races is what they are

aiming at, and they are much more likely to increase than decrease in the near future. The alliance between Germany and Austria was doubtless the more willingly accepted by the latter because of the millions of Germans and the predominance of the German element in Austria. In any struggle between this power and Germany the eight millions of Germans would be more likely to gravitate towards Germany than to cling to either the Slavonic or Hungarian elements which with the Germanic go to make up that heterogeneous nationality of Austro-Hungary.

It were even unwise in the Italians to make Austria distrustful of them now, though she is their ancient and was their bitter enemy. The house of Hapsburg is gradually losing its hold and its ambition in regard to conquest or influence in Western Europe, and is turning its eyes eastward. The valley of the Danube to the Black Sea is the great prize of the near future. The Turkish provinces in Europe can not much longer remain in the hands of the Moslems, and Austria as next neighbor can most easily and naturally move in and possess them. That she is inclined to do this is quite evident, though in the effort she will have a formidable rival in Russia. She, therefore, needs to make friends of ancient foes, and is, indeed, inclined to do this, as is seen in her reconciliation and alliance with Germany and with Italy. Now if Germany thinks it worth while to maintain friendship with Austria, for a much stronger reason may Italy.

Italy is, indeed, just now most fortunate in holding a place among the European powers that inclines them all to spare and favor her. They all feel friendly toward the new Italian kingdom, and even the Catholic states show no inclination to interfere between her and the pope. Were these so inclined they could reinstate the pontiff on his temporal throne without much if any effort. But Italy is free from all envious neighbors, and is thus left unembarrassed to meet the questions of her internal development and to carry on her struggle with the papacy. If she is not competent to this she scarcely deserves the fair chance for regeneration that is offered to her.

The French people very emphatically desire the friendship of Italy, and as a nation stand by her in her conflict with the pope. The days are past when French troops will retain a pontiff in the temporal power against the expressed will of his own nation. The ruling influence now in France, though it is a Catholic country, is not in favor of Ultramontane aggression. The relations between the two countries have always been close, and the bonds that unite them are growing finer with every year. In the present condition of Europe the amicable relations of these two peoples born of the same blood are the necessary pledge of peace that all the states of Europe now desire, and on the banks of the Tiber as on those of the Seine the two governments will do nothing to weaken the most cordial and affectionate relations. The period has fortunately gone by when the just pride of the Italian nation was mortified to feel at every instant the troublesome hand of Louis Napoleon interfering with the natural national aspirations for the unity of the nation.

The French people have bitterly expiated the faults of the empire, and their misfortunes have left no other impressions on their neighbors than those of the glorious pages of history written in common for their liberation from the galling yoke of Austria. Republican France has never desired to assume this control of Italy, but has, on the contrary, ever felt an active sympathy for the noble Latin race that inhabits the land of glorious souvenirs. And on the southern declivity of the Alps the children of Italy are politicians and statesmen too skillful not to comprehend the value of the friendship of France. And this was the more keenly experienced the very day after the consummation of the coalition between Germany and Austria, for then the government of King Humbert was to a certain extent condemned to be but an appendage of the two emperors. It was thus natural in Italy to approach France not to make war but to strengthen the bonds of peace.

Though Italy is monarchical and France

republican in form of government, this difference does not necessarily imply a different *régime;* there is an evident analogy between the two systems, and the hereditary character of the House of Savoy does not prevent the principles of republicanism from being as victorious at Rome as at Paris. In both of these great capitals the popular voice is acknowledged, and it imposes its will on the rulers by the respect of the parliamentary majority as the supreme law. The son of Victor Emmanuel is king at the Quirinal by the national will. In France, where for centuries there has been a commingling of the inhabitants of the different and diverse provinces, the election now reaches to the summit of power. In Italy, where local rivalries are not yet extinguished, the throne is actually the preservative of national power, and saves the national unity—it alone is the keystone of the arch of the reconstructed country. But there is nothing incompatible in an international point of view between these forms of government founded on the same broad idea, and these sister nations are, therefore, separated by no antagonism.

On the contrary, there is just now a remarkable similarity between the situations of the two countries and the representatives of the people. In both nations the majority belongs without contestation to the liberals; but in both nations the want of a common platform renders the existence of ministries very precarious, and it is much to be desired that an accord may be reached in both instances as to a line of government policy. Various futile attempts to this end have been again and again made at Rome and without result. One ministry was lately deposed on the question of tax on meal of various kinds, and the very ministry that succeeded it fell on the same question. If such complications continue it will be impossible to avoid a dissolution of Parliament, a danger barely averted last year. It is not easy to tell what might be the result of new elections of a premature kind; nothing good, at least, is now anticipated.

But the Italians are fortunate in not seeing, as do the French, a revolution between the liberals and the conservatives. None of the Italian factions are animated by a reactionary fury that would lead to a revolution in the government. Many noble Italian names that are now on different sides in political contests, were combined in the grand following of Cavour in his campaign for the reconstruction of Italy—such as Sella, Minghetti, Cairoli, Depretis, and others. These men glory in being the heirs of his convictions since death extinguished his genius. They are now not clericals, nor enemies of liberty nor partisans of *coups d'état*, nor fanatical admirers of a state of siege in the midst of peace, nor of any other measure for the repression or frustration of the will of the people. To compare these men to the conservatives of France is to do them great injustice and ignore all their liberal past. Italy is fortunate in having no irreconcilables that would destroy the present dynasty at all hazards and raise a tempest that might submerge the country.

It is greatly to be desired that the wisdom of the men now in power might by their union avoid electoral complications and find a basis of reconciliation for the diverse shades of the same ideas. Every reaction is a great danger, for a revolution that goes back but a single step is a compromise. A retrograde movement would now be a calamity for Italy and for the House of Savoy itself. But whatever may be the changes in the internal affairs of the two countries, there is little doubt about the future relations between France and Italy, because there are not only mutual sympathies between them, but there are common interests and common objects. The rumored alliances among other nations all tend to bring France and Italy nearer to each other. In mutual support without mental reservation and without rivalry and ambitions, the two nations may boldly advance in the path of improvement and progress. The future should contain happy fortunes for them, and their friendship is like peace in the same family. If they are separated they may be the prey of terrible events from which no subsequent union could preserve them;—no Latin blood can now flow without putting

into peril the very life of all these Latin nations, simply because of the increasing sympathy and power of the nations of Germanic stock.

One of the most troublesome questions for the pope at home in the city of Rome has been that of the municipal schools. The first question that engaged the statesmen who followed Victor Emmanuel to Rome from Florence was that of the intelligence of the people. In the census taken as soon as the new government was organized it appeared that nearly half the population could neither read nor write, and if honest replies had been given to the takers of the census, it is believed that the proportion would have been even greater.

Now no crime could be more directly traced to the papal authorities; for the educational work in the Eternal City had been intrusted to the hands of the priests and nuns. If the masses were steeped in ignorance, these parties were to blame for it. They taught the doctrine that the instruction of youth should be a monopoly of the Church, and declaring that the mission of teaching was conferred by Christ, the great teacher, on them alone, they deliberately went to work to neglect it. They saw the result when too late—for they scarcely seemed aware of the condition of Rome until the municipal authorities unveiled their "whited sepulchers." Then certain parties among them raised the cry of reform in their schools, but it was too late; they had had a fair opportunity to show their hand and they had been found wanting.

The government made up its mind to have nothing to do with them, but, on the contrary, to undertake to instruct the children itself in a way that would lift them out of degradation and make intelligent citizens of them. To this end elementary schools were established in many localities that had hitherto been entirely deprived of all advantages of this kind, as soon as secular teachers could be obtained, for this was no easy matter in a country where until then the necessity of such teachers had not existed. This work has been carried on with great vigor and success, and now the municipal schools are among the prominent institutions of Rome and are being rapidly extended over all Italy. The struggle has been a very bitter one between the Vatican and the municipality, but the latter has had all the sympathy of the people and all the aid of the many intelligent foreigners settled in Rome since the so-called "occupation." The municipal schools now contain their thousands of pupils and many teachers of both sexes. A supply of the latter are now being prepared by normal schools established at various centers under intelligent guardians, and with gratifying results. The latest statistical returns in regard to the work throughout all Italy is quite gratifying and almost incredible in view of the papal dearth in this line under the priestly *régime*.

Some of the papal schools have chosen so to modify their system as to make themselves quite acceptable to the state, and these have been aided by the latter or adopted by them. But on the part of the priests this has always been a work of necessity and not of choice. Some of the nuns have even gone so far as to grant their quarters for this purpose, and to allow them to be altered and adapted to the new state of things, and a few of these are now engaged in schools in the neighborhood of some of the hitherto most neglected and degraded quarters. This is especially the case with the Jews, who were much oppressed and cruelly treated in Rome by the Catholic power. They were excluded from the comfortable quarters of the city, made to pay heavy taxes or special tributes, and at every turn reminded of their servitude and degradation. Now their children are among the most prominent in the municipal schools and the most eager to profit by their newly acquired advantages. We need hardly add that secretly the papal power is exerting itself to the utmost to retain possession of the people's education; but the decree has gone forth that this is not to be. The Italian ministry of education is one of the most lively and enlightened of the cabinet, and is making great efforts to regenerate the land, knowing how much success in this great struggle with the papacy depends on an enlightened public opinion.

LIFE'S QUESTION.

DRIFTING away,
Like mote on the stream,
To-day's disappointment
Yesterday's dream;
Ever resolving—
Never to mend—
Such is our progress;
Where is the end?

Whirling away
Like leaf in the wind;
Some point of attachment
Left daily behind;
Fixed to no principle,
Fast to no friend—
Such our fidelity;
Where is the end?

Floating away,
Like cloud on the hill,
Pendulous, tremulous,
Migrating still;
Where to repose ourselves?
Whither to tend?
Such our consistency;
Where is the end?

Crystal the pavement
Seen through the stream;
Firm the reality
Under the dream.
We may not feel it,
Still we may mend—
How we have conquered
Not known till the end.

Bright leaves may scatter,
Sport of the wind;
But stands to the Winter
The great tree behind.
Frost shall not wither it;
Storms can not bend;
Roots firmly clasping
The Rock at the end.

Calm is the firmament
Over the cloud;
Clear shine the stars through
The rifts of the shroud.
There our repose shall be;
Thither we tend—
Spite of our wavering,
Approved at the end.

THE COURSE OF LIFE.

O LET the soul its slumber break,
Arouse its senses and awake,
To see how soon
Life, with its glories, glides away,
And the stern footsteps of decay
Come stealing on.

How pleasure, like the passing wind,
Blows by, and leaves us naught behind
But grief at last;
How still our present happiness
Seems, to the wayward fancy, less
Than what is past!

Our lives like hasting streams must be,
That into one ingulfing sea
Are doomed to fall—
The sea of Death whose waves roll on
O'er king and kingdom, crown and throne,
And swallow all.

Alike the river's lordly tide,
Alike the humble streamlet's glide
To that sad wave;
Death levels poverty and pride,
And rich and poor sleep side by side
Within the grave.

Our birth is but a starting place,
Life is the running of the race,
And death the goal;
There all our steps at last are brought
That path alone, of all unsought,
Is found of all.

To thee, O God, my thoughts arise;
Thou great Eternal, Good, and Wise,
To thee I cry;
Gird me the race of life to run;
And give me then the victor's crown,
With thee on high.

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE SUBJECTIVE CHRIST.

LIVES of Christ have become a marked feature of the religious literature of the times. Writers of nearly all grades of ability, and occupying all possible positions respecting the Christian faith, have essayed the theme, some to exalt the subject and others to depreciate it, and still others to set the whole matter in the clear light of a historical and philosophical realism. That the outcome of this concentration of learned labors upon a theme of such transcendent greatness will be good rather than evil can not be doubted. There was need that the subject should be submitted to a much more thorough and scholarly treatment than it had received before it was taken in hand by the destructive critics of the Tübingen school, and very certainly the re-examinations and discussions made necessary by such attacks have contributed very largely not only to the evidences of Christianity, but also to a just appreciation of Christ's personal character, and also of the nature of the Christian life. In this case, as in many others, have the evil designs of the enemies of the Gospel been overruled to its furtherance.

Most recent lives of Christ are chiefly objective. They approach their subject as one of facts, and contemplate him of whom they discourse as a historical person—living and acting and teaching among the existing circumstances and conditions of his times. The whole subject has thus been taken out of the realm of fable, where it was placed by the Apocryphal Gospels, and of fancy, in which it had been considered by devout but imaginative contemplatants. The Gospel history has thus been brought to the test of rational proofs, and by this process it has been shown that not only are its external evidences able to endure the clearest and strongest lights, but the Gospel narrative itself requires just such thorough treatment in order that its own excellences may be properly appreciated. As with whatever is intrinsically excellent, this great subject—the human history of Christ—is seen to advantage in proportion as it is set in the clearest lights.

To estimate duly the person and character of Christ, his life-story must be considered with such fullness of details, and yet with an intelligent discrimination of things really dissimilar, that his whole complex character shall come clearly into view. To contemplate him simply as a man is to fall entirely below the requirements of the evangelical history; and to consider him as altogether divine would be to defeat the designs and practical purposes of his incarnation; but to recognize both the human and divine in his person, and yet to hold them each distinct and complete, are points required alike by the letter and spirit of the New Testament narratives. How fully and satisfactorily all this has been accomplished in our later and more elaborate lives of Christ is well known; and as the original Gospels were written that men might believe "that Jesus is the Christ, the Son of God," so by harmonizing the four independent sketches, and by the presentation of their details in proper order, and by illustrating the whole subject from the geography, contemporary history and customs of the times, the purpose for which the Gospels were given is much more effectually accomplished. Probably in no other form has so valuable contribution been made to the Christian literature of the age as has been done by that class of works.

We denominate these discussions as specifically *objective*,—treating mainly of the historical and phenomenal Christ; but they are not exclusively of that character. It would be impossible to set our Lord's history in a clear and intelligible light without recognizing and, to some extent, considering his peculiar per-

sonal character, and making the proper inferences from its exercises and influences over his words and actions. Even the most thoroughly phenomenal of the Gospels brings into view the inner life of Christ,—sometimes by direct statements, but more fully by implications and suggestions,—while the fourth Gospel, which has been not inaptly styled the "Heart of Christ," is largely an uncovering of that interior life, at once so truly human, and yet so eminently divine. Into this field our modern biographers of Christ have entered only in part—partly, perhaps, through want of due appreciation of a subject of such transcendent excellence, or else restrained by its unapproachable sacredness, from coming near to such holy ground. Nevertheless, there have been those who, taught by the Spirit, have dared to come by the blood of the everlasting covenant into this holy of holies,—and by faith to contemplate that highest form of spiritual worth,—a human soul enshrining in personal union with itself "the brightness of the Father's glory, and the express image of his person."

Standing a little aside, with unsandaled feet and bared head, we may look upon this glorious object, thus presented to us through the veil of his flesh; and still more clearly may we observe the workings of that essential humanity in its growth and development, its exercise in its various conditions and its evident perceptions, emotions, and high resolves. For though Christ's essential humanity was in itself in nothing distinguished from the same thing as it appears in others, yet because of its entirely unique relations, by reason of its personal union with divinity, its exercises and the resultant phenomena, must have been modified by those conditions. It was, indeed, as a human child, and youth, and young man, that he "grew in favor," was "in subjection," and lived and learned and discharged the duties of a member of the social body for thirty years. But since during all that time his humanity subsisted in personal union with the divinity, it must be presumed that the latter made itself felt in the former. It is no doubt entirely right and proper for us to contemplate the "man Christ Jesus" as he presented himself to human observation,—a man among men, and subject to all our conditions and accidents,—for so it became him that "he should be made like unto his brethren." It is equally right and necessary that we shall not forget that during all these years of earthly sojourning he was "very God," that enshrined in that human soul was the reality of the Godhead—and though perhaps all this time hidden from his human consciousness, yet actively and effectively present, to move and actuate that soul, to direct its developments, to lift its aspirations heavenward, and to point it to the work for which it was destined, and for whose performance he was all this time in training. Only in this manner can we form to ourselves a just conception of the spiritual history of Jesus of Nazareth.

To inquire at what date of his being the divinity became conjoined with our Lord's human nature would be an idle speculation, since the whole subject, even in its natural aspects, lies beyond the range of human knowledge. We find, however, that even before his birth there was a recognition of his superhuman character, and in his earliest infancy he became an object of worship. There seems, therefore, sufficient reason to believe that the union of the divinity with the humanity of the Son of Mary dates from the very beginning of that human life. It is equally evident that the growth of that humanity—its mind and spirit not less surely than its physique—was entirely normal, and agreeable to the usual development of the human subject. The indwelling divinity in no wise forced the humanity out of its normal courses. In earliest infancy he was like other infants, without mental actions or self-consciousness, and when, a little later, he began to think and become conscious of his own being, it was by no supernatural influence that it was effected. The babe in his mother's arms, or the little child at her knee, was simply a babe and a child; and after all that she had heard and known of his birth, it is not strange that she "kept all these things in her heart." His thirty years of seclusion at Nazareth were indeed especially, though not exclusively, the years of his humanity. There he lived and grew as a child, and obeyed and learned as a youth, and labored and thought as a man. The grounds for inference (and *inference* is all that the case admits of) respecting his full recognition of his own character and calling seem to force the conclusion

upon us that this did not come to him till the time of his baptism, though quite certainly the announcement then made to him was not altogether a surprise. Though the veil that divided the human from the divine consciousness in him had not before been drawn aside, yet most assuredly there had come to him clear and forcible indications of indwelling divinity, and strong prophetic intimations that it should be given to him to do somewhat for the redemption of Israel. Thus our great English poet has rendered it:

> "Victorious deeds
> Flamed in my heart, heroic acts; one while
> To rescue Israel from the Roman yoke,
> Then to subdue and quell o'er all the earth
> Brute violence and proud tyrannic power,
> Till truth were freed and equity restored."
> *Paradise Regained*, Book I, l. 215-220.

The brief account of his visit to Jerusalem at twelve years old, like an opening into a dark chamber, lets in a momentary flood of light, which, however, while it gives signs of the present divinity, gives no further details respecting the subject. That such a child, among such surroundings, should have been exceptionally affected is altogether natural; nor is it strange, though he might not have been able to say why, that he should feel while in the temple that he was in his Father's house, and while engaged in learning the deep things of God that he was "about his Father's business." That he there clearly understood his own character and the duties for which he was destined is scarcely to be supposed, and yet it need not be doubted that the prophetic impulse was upon him, impelling his words and actions above his own reason. Coming up for the first time to the feast that commemorated the deliverance of his nation, this wonderful boy could not fail to feel his whole soul strongly moved by the things he saw, and that were brought to his mind. He had heard of Moses and Samuel, of David and Elijah, and of the Maccabees, and his heart was stirred with a glowing patriotism; but above all these things, his devout soul delighted in the law of the Lord, and therefore he lingered, the most intelligent as well as the most truly spiritual listener that waited upon the words of the wise teachers.

After his return he remained eighteen years in the seclusion of an obscure Galilean village—subject during his youth to his reputed father and his mother—and later, it is supposed that he became, with his mother, now a widow, the head of a somewhat numerous family. It seems strange, and yet it is no doubt according to historical reality—to contemplate him engaged in the secular duties of life—not only working with his own hands, but also directing domestic affairs, and engaged with others in bargaining for work and materials, undertaking jobs, and fulfilling contracts, and meeting all the requirements of his position as a member of society. But since the details of this form of life do not affect his great religious mission, all these things are passed over by the Holy Spirit in absolute silence. It is enough for us to be assured that he was verily a man among men, and that he knows by experience all about our every-day duties, and in them he was tempted in all points as we are, yet without sin.

And yet these apparently blank years at Nazareth were no doubt most fruitful of results, which culminated in Christ's public ministry, and his atoning sacrifice. Though little known to those about him, he evidently lived in close and loving communion with nature, by which his memory and imagination became stored with the facts and illustrations which he used so effectively and beautifully in his public ministration. Probably he seldom or never mingled in the rough plays of the villagers, but instead wandered alone among the wooded hills above Nazareth, conversing with nature, observing the clouds and the winds, the trees and the flowers, the wide-stretching plain and the distant sea, or the towering heights of Hermon and Lebanon, with all of which fund of imagery his discourses are so abundantly illustrated. He was also most certainly a diligent student of the sacred oracles, by which he became thoroughly learned in the history of his own nation, and especially in the Messianic promises of the coming kingdom of heaven—those things concerning himself which he came to fulfill, and which he soon afterward proclaimed to the people. And with all these things he must have felt himself to be in some way intimately connected. They were to him even then matters of lively, personal concern, and though as yet he saw not his special relations to them, yet he felt them to be his own, because they were his Father's business.

Such a person, living among the conditions of a country village, could not fail to attract notice; and in proportion as he was not understood, he would become an object of wonder, and perhaps of distrust. And yet even then something of the sanctity of his character would seem to have been recognized by his fellow-townsmen, who apparently confessed his fitness for such a service when he first stood up in the synagogue to read and expound the Word of the Lord. They knew him, who he was, and who were his kinsfolk and family; but beyond this individualization they were wholly unacquainted with him. They were entire strangers to the thoughts that possessed his mind and ruled in his heart; they knew nothing of the motives that governed his actions, nor of the aspirations that warmed and inspired his heart. Even then he was a stranger among his nearest and most intimate associates, and he had "meat to eat that they knew not of," which was to do the will of the Father, and to perform the duties of his mission.

Great minds are usually solitary, both from inclination and from necessity. In proportion as they rise above the common level, they become removed away from the recognition and the sympathies of those among whom they may locally abide. The points of contact with the multitude about them become fewer and less intimate by reason of their elevation above the low level of common men. Probably, therefore, Jesus of Nazareth, as he was the most exalted of men, was also the most solitary. And this was true in the home of his youth as well as later in his wider ranges among men; and when his career on earth was ended, probably there was not a living soul who had ever really known him, or who could justly appreciate either his words or his actions. His mother, with a depth of spiritual insight beyond any other, could only wonder and ask what might be the import of his words, and wait in faith for their fuller unfolding. His own disciples, closely and lovingly as they were attached to his person, never till he had been taken from them understood the spiritual import of his teachings. The scribes and Pharisees always, and from the necessities of the case, misunderstood him; and even such a man as Nicodemus heard him only to "marvel," and failed to recognize either his person or his doctrines, though confessing that he was "a teacher sent from God."

The association of our Lord with his disciples was, doubtless, in some sense very intimate. They were much together, and Jesus was evidently very free in his intercourse with them; but it is also plain that during all that time they did not know him, and were quite incapable of entering into the lofty meditations and high designs with which he was occupied. In thousands of unrecorded conversations he probably descended to the level of their thinking, and talked with them freely upon themes less exalted than that which chiefly concerned him, and from such intercourse may have grown up mutual human friendship; but in respect to the great work in which he was engaged, and the character and thoughts by which he was adapted to that work, they had no proper conception. The implication in the question put to one of them in his last conversation with them, "Hast thou been so long time with me, and yet hast thou not known me, Philip?" applies equally to all of them. In his solemn contemplations of his great work, as well as in its performance, he was *alone*. He could commune with no sympathizing heart upon that tremendous theme. Though ever present to him, either as a dark shadow upon his heart or as a glory to be revealed and enjoyed hereafter, he found no sympathizing human heart that might share his soul's burdens.

The revelation made to him at the time of his baptism precipitated the crisis of his career, and changed the expectant young Galilean into the self-recognized Messiah. All his past yearnings and aspirations—his inward questionings and his expectant zeal for the redemption of Israel—were now answered with infinite fullness. The divine hand drew aside the veil that separated the divine intelligence from the human, and the unbounded sea of divine truth poured itself into and mingled with the intuitions of the young prophet of Nazareth, now declared to be the Son of the living God. He now saw himself the promised Deliverer, of whom the prophets testified—the Redeemer that should come to Zion. It was, therefore, as to his own conscious self-appreciation, a very different person that came up from John's baptism from

him that had come to it. Such a tremendous revelation, with its accompanying disclosures as to the future, required time and opportunity for prayer, and meditation, and communion with the Father, and preparation for the work that was to be done. He was, therefore, "led by the Spirit into the wilderness." Of the experiences of that eventful time of special trials and conflicts, with their peculiarly subjective characteristics, we have written elsewhere, and will not now repeat what was there said, though that whole affair belongs especially to the inner or mind's history of our Lord. From that conflict he came forth prepared to engage in his great prophetic mission, to unfold to men the mysteries of the kingdom of heaven, and actually to set up that kingdom in the earth. No doubt even then he clearly foresaw the end for which he was to labor made sure to him by the promise of the Father. It is equally evident that the intermediate stages of the work—its methods and agents, its helps and hinderances—were not yet fully apprehended. He went forth to subdue the world to himself and to the Father by purely spiritual means—by the Spirit and the truth; but would not Israel receive her divinely commissioned prophet, and gladly accept the truth he should bring them, and consent to be made free by it? Would not Judah, smitten for her rebellion, now return and be saved at the coming of David's Son and Heir? All his love of his own people and his zeal for God inclined him to hope so.

From the conflicts and triumphs of the temptation Jesus returned to Bethabara apparently to co-operate with John in his ministry of repentance, and thus to bring in the "kingdom of heaven." The Gospel history of these transactions, though brief and fragmentary, indicates the prevalence of a season of high religious interest at that time, in which John and Jesus acted in harmony, though somewhat independently of each other—the ministry of Jesus and his disciples steadily increasing beyond that of John and his disciples. To this method of working it is evident the Divine Spirit impelled our Lord, and it is no impeachment of his wisdom nor of his divine inspiration to presume that he expected through that work to bring in the new reign of grace. He accordingly called certain chosen disciples to be always with him, with the evident purpose of making them the depositaries of his doctrine and his messengers to spread it abroad over the land. An air of cheerful and earnest hopefulness pervades the whole record of this stage of our Lord's ministry, and there seems to have been a wide-spread religious awakening among the people, accompanied with a general expectation that the promised kingdom was very soon to be inaugurated—an expectation which Christ himself, at that stage of his ministry, may have shared. Jesus also made extensive journeys to Galilee and to Jerusalem and Judea, passing through Samaria, and every-where preaching the Gospel of the kingdom. But at length came opposition, first from the Scribes and priests, that were drawn from Jerusalem to the Jordan by the fame of the religious revival prevailing there, who evidently assumed the attitude of persecutors; and afterward by Herod, who was induced to cast John into prison, and afterward to put him to death. To escape from these things Jesus with his disciples removed to the shores of the Sea of Galilee, a wiser and a sadder man; for it had become evident that the Gospel of the kingdom was not to proceed directly from those beginnings. It is quite consistent with the highest conception of the divinity of Christ to hold that in many things his human expectations were not realized; and though no part of his ministry was a failure, yet it is not equally certain that the *mode* of its success was invariably foreseen by him.

In Galilee he was free to preach the Gospel, and to work miracles, without fear of violence from the Jews, and accordingly in this new field he next opened his ministry, directly and earnestly antagonizing the false teachings, and the worse than puerile refinements of the rabbis. Hence arose those fierce and earnest disputations which make up so large a part of Christ's public ministry. He had now come fully to understand that the incoming of the kingdom must be not only without the help of the recognized teachers of the law, but in opposition to them, and over their heads. They themselves would not enter in, and those that were about to enter in they hindered. The sharpness and the stubbornness of their opposition are indicated by the severity of our Lord's denunciations against them, and his evident carefulness to have all about

him understand that the accredited teachers of the law were the enemies of his Gospel, and opposed to the will of God The war between the parties was fully proclaimed, and prosecuted on both sides with unsparing severity. There was need that the truth should be spoken, without concealment or mitigation, and the hollowness of the prevailing religious system must be exposed and denounced, and the time for gentle measures was entirely past.

To the politic and temporizing Christ's providence in this case might have seemed unwise and unnecessarily severe. Had he dealt more gently with these learned rabbis whom the people so much reverenced, such a one might have said, it might have been that he would have avoided much of their hostility, and, perhaps, by degrees overcome their opposition. But he had learned in his victory in the last and most subtle temptation that the world is not to be won for God and Christ by worldly expedients nor by compromises with the prince of this world. It was time that the pure Gospel should be proclaimed in all its spiritual fullness, and accordingly, taking his stand upon the little elevation called from that day's services the "Mount of the Beatitudes," he proclaimed a whole system of religion, before which all hearts still bow in reverence. His teaching was, indeed, with authority, because of its substance; but neither in its form nor its matter was it like the lessons taught by the scribes. This new Gospel could not be cast into the old form of those accredited teachers, and, therefore, by preaching to them the truth he made them his enemies. The delivery of the Sermon on the Mount consummated the breach between Christ and the Jerusalem hierarchy. Henceforth his career was to be one of open warfare against them.

But while thus engaged with the rabbis and scribes, his more private life was marked by gentleness and practical kindness to the sorrowful and helpless, and of forbearance toward the sinful. He healed the multitude of diseased ones that came to him; he instructed the inquirers who brought their doubts to him for solution, and could even spare the necessary time in the press of his occupations to speak words of love to the little children that were brought to him, and to indicate their relation to his kingdom. In respect to the great work upon which he had now fully entered, he had evidently become possessed with an all-consuming zeal—not, indeed, as a heated partisan, but as he was impelled by a deep devotion to the will of the Father, and to the cause to which he had given himself—with the sense of its infinite importance and the necessity for its present doing, to which work he was himself specifically called. There was no hate in the burning words in which he denounced his opposers and their works; but because they and their whole system was opposed to the kingdom which he was sent to establish in the world, it had become a necessity that their true character and position should be declared. Of the final outcome of the conflict he could have no misgivings—for as to that he had the promise of the Father; but the processes through which it was to be accomplished—the forms and degrees of opposition to be overcome, and the sufferings to be endured by the way, were evidently successive disclosures. He saw the fields whitening to the harvest, while the laborers to perform the work were wanting; and yet in prophetical vision he saw the adversary cast down, and his own reign of grace begun. His whole soul became aroused and energized for his work, and though saddened in view of the ruin that sin had wrought, and especially in view of the wicked infatuation of the rulers of the people, yet his full conviction that his work would not fail sustained and cheered him.

There are clear indications, however, that even at this time our Lord felt very keenly his want of human sympathy. He had come to his own, and his own received him not, and even those nearest to him and most nearly in sympathy with him very inadequately appreciated either himself or his work. He could not declare these things to his own disciples, because they were incapable of understanding them.

It was, doubtless, at least in part, for this cause that he so often, and for such protracted seasons, secluded himself even from his disciples, sometimes spending the whole night in prayer. Only in communion with the Father could he find one capable of really sympathizing with the mighty movements of his own spirit. The presence of those not in sympathy with the heart's high emotions, when the

spirit is elevated in holy thoughts and feelings, is a painful intrusion; and the non-sympathy of even his disciples with his mission and his spirit must have made actual solitude at all times a relief. And removed from every annoying presence, his soul would spontaneously flow out in holy communings, in prayer and adoration, before the ever-present Father.

That Jesus most painfully felt this loneliness and seclusion from the cheering countenance of appreciating friends is, however, very evident. We see signs of his feeling after it, among his disciples, and of his disappointment when it was not found. On the mount of the transfiguration he rebuked their inattention, and in Gethsemane he evidently "wondered that there was none to uphold." He went to his death enduring the untold agonies of redemption, not only unsupported by any man, but without one cheering word or sympathizing thought as to that work from any of the race. In this is seen the greatness both of his suffering and his love. *Alone*, and all the more so because he was locally in company with many, he lived and labored, taught and died. He had dwelt among men, himself a man, with all our human feelings, and with a heart peculiarly susceptible to tender sympathies; but as to that in which he was interested infinitely above all else, no one understood him, or could share his heart's deep feelings. He himself declared all this, but found consolation in the fact that he was not alone, for the Father was with him.

His more public utterances, whether in Galilee or at Jerusalem, simply embody the great truths and doctrines of the Gospel which it was his especial work to reveal to men; but in his intercourse with the Twelve we come somewhat more closely to his inner and personal life; and here we may note his evident purpose to prepare them for the end of his own career and the beginning of theirs. To adopt the language of another—one commonly recognized as merely a secular writer, and yet who seems to have looked into this deep subject with unusual correctness of perception—"The key-note of it [his conversation with his disciples], in spite of certain short and beautiful interludes, appears to be a sense of loneliness and oppression caused by the feeling that he has work to do, and words to speak, which those for whom they are to be done and spoken, and whom they are, first of all men, to bless, will either misunderstand or abhor. Here is all the visible result of his labor and of his travail." (Thomas Hughes—"Manliness of Christ.") His disciples were, beyond all question, loyally attached to his person and faithful to his instructions, as far as these were understood. While the better disposed part of the people were inclined to look upon him as the expected "Elias," or as one like the greatest of the old prophets, their own conception had risen still higher, and, more adequately interpreting the Old Testament prophecies, they identified him as "the Christ, the Son of the living God." It is very plain, however, that even they were far from entertaining right notions respecting the character and the work of him in whom they had come to believe. Finding them thus far established in the faith, he proceeds further to inform them respecting what he was about to do and to suffer. He was, indeed, the person whom they believed him to be; but his manner of accomplishing his high commission was not such as they had anticipated. He was not to triumph outwardly over his enemies, but would be overcome by them, and put to death; and at this announcement the best of them were first indignant and then overwhelmed with sorrow. Even his most faithful disciples understood not this saying, "and it was hid from them that they perceived it not." Perhaps it is allowable, at least to entertain, though we may not accept, the thought that a recent very devout writer has suggested as to the workings of Christ's mind at that critical moment: "Jesus evidently felt a temptation assailing his own mind, suggested by Peter's words—a temptation to avoid death and abandon his cause. These words [his answer to Peter] are aimed directly against the tempter, as they were in the early scenes of the temptation, 'Get thee hence, Satan;' and Peter, unconscious of blame, is lost sight of." (Sears—"Heart of Christ.")

As times and events passed on, and the terrible *denouément* of his life-drama was approaching, his subjective life, as distinguished from the objective, becomes more and more clearly marked. A careful study of the Gospels, and especially that of St. John—not neglecting an allowable amount of reading between the lines—will detect significant intimations that

back of his life before men was another life, into which he was all the time more and more fully entering, and out of which he was bringing to the surface many excellent and wonderful things respecting the kingdom of God. His predestination to death was among the earliest of the things made known to his human consciousness, after he entered upon his public ministry; but the details of that sad event seem to have been given to him by degrees, and with steadily increasing fullness. Yet even so late as his last journey toward Jerusalem he had not been divinely assured as to the place where he should suffer—though to his human judgment it seemed altogether probable that it would be in that city where nearly all his predecessors in the prophetic office had been slain. His teachings while on that journey have an unwonted depth of tone when speaking to the people, and even more so in his private intercourse with his disciples; and, although they failed to fully apprehend the meaning of his words, yet they caught their spirit and felt the shadow of them in their own souls.

And although Jesus then and there related in the most explicit terms how he was going to Jerusalem to be betrayed and condemned and put to death, still his disciples failed to understand him, but continued their ambitious plottings for the high places in his kingdom—which kingdom, according to their gross and secular conception of it, the multitude believed that he was about to inaugurate. On their part was seen just at hand a worldly kingdom, with its external glory; on his was contemplated "a bitter cup" to be drunk, and a fearful "baptism wherewith to be baptized." To both of these visions the scenes that followed at Jericho, at Bethany, and in Jerusalem very fully agree; the Galilean multitude would bring in David's Son and Heir to redeem and rule over the kingdom of his father; the priests and rulers dreaded the coming of the invader, whom they knew to be not of their party, and counseled how they might destroy him—while he himself was engaged in his own proper Messianic work, which none of the others could understand.

That wonderful account given in the twelfth chapter of John, when the coming of certain Greeks, who desired to see Jesus, was at once interpreted by him as an indication that his work on earth was well-nigh accomplished, records a revelation then and there made to himself from heaven. The hour for his own glorification had come; but it was to be accomplished by his death, which he clearly foresaw and bravely welcomed, and yet not entirely without misgiving. Recognizing his own nearness to the Father, his natural feelings suggested the question whether he might not be "saved from that hour." But he himself answered his own question with more than a martyr's self-devotion—"Father, glorify thy name." Nor was there any need that he should be outwardly assured of the Father's good pleasure and glorious purposes in respect to himself, but for the confirmation of the faith of his disciples, and for the stability of his truth in all the after ages of the Church, a voice from heaven declared "I have glorified, and will still glorify." He had come to Jerusalem to die there; but he desired before that last sad event to accomplish two other things—to celebrate the Passover for that year with his disciples, and to unfold to them, more largely than he had yet done, the deep things of the kingdom, then so soon to be brought in with power. How both of these were accomplished is well known; the Passover was eaten, and at the same time a better Passover was instituted—a memorial of his own death not yet realized; and those wonderful lessons of heavenly truth found in the fourth Gospel, then but dimly apprehended, but since made so gloriously manifest by the Holy Spirit, were spoken to the wondering disciples. But the veil was still upon their hearts, and they only very partially understood what they heard. From that supper in the upper chamber, Jesus went forth even more alone than ever hitherto to Gethsemane, to the house of Caiaphas, to Pilate's judgment-hall, to the presence of Herod Antipas, back again to Pilate, and thence to Calvary; and yet, though forsaken of men, he was not alone. The veil that divided the human from the divine in his complex person was rent away; the divinity sustained the humanity in the fearful conflict of the work of redemption, accomplished in his dual personality. Such was the subjective Christ: "He was in the world, and the world was made by him, and the world knew him not."

"His soul was like a star, and dwelt apart."

FOREIGN AFFAIRS.

REVIVAL OF MONASTICISM IN FRANCE.—It is noteworthy, that just as monasticism is going out of repute and sinking in Italy the taste for it is reviving in France. In not a few towns in the South the monastery is becoming as common a sight as the *pépinière où on fait les curés*, as the lay folk scornfully dub the *Séminaire* or theological college. These latter-day cloisters are a favorite retreat for idle gentlemen who have tired of society, or who find that society has tired of them. In one much-frequented watering place, says the London *Saturday Review*, the revived convent of the Carmelites makes one of the chief attractions of the placé, keeping up a continual rivalry with the theater, the band, and the casino. In the Church, attached to it, there is a constant succession of functions with striking æsthetic effects, and special preachings by popular preachers of the order from every quarter of the globe. The sight of the brethren, too, as they flit noiselessly to and fro with the alms-bags, or emerge in single file from their screened-off seats into the choir when the sermon begins and the singing of one of them, who a short time ago was the gayest of the gay, and the darling of society, all contribute to the popularity of the services and of the place, which, perhaps, on this account, is a favorite haunt of English "verts." The ranks of the inmates of such establishments are generally filled up by men who have been crossed in love, who have lost heavily at play, who can not get on with their wives, or are otherwise the victims of domestic worries, and seek safety in flight. But of what goes on within the walls outsiders seldom hear, though once we were told, on good authority, that a certain doughty old general, who had exchanged the sword, which had done his country much good service, for the frock, was so very "infirm of purpose" about turning out at all hours of the night to say his prayers, that he was constantly in disgrace for disobedience to the rules of the order he had joined.

FROM KITCHEN TO THRONE.—In a republican country like ours it is but natural to look for perfect equality of all conditions of men. Yet willing or not the distinction of class we must admit is gaining ground among us, and erelong the aristocracy of the woolsack will be ours too. Yet in the midst of these things even worth has its rights and is sure to assert them. How true this is, even under princely rule, is well illustrated by the peculiar history of a comely and modest woman who, with her fortune of face, enjoyed the still greater fortune of knowing how this beauty became her best. But hear the story as it has passed into history: "During the troubles in the reign of King Charles I, a country girl came up to London in search of a place as servant-maid; but not succeeding, she applied herself to carrying out beer from a brew-house, and was one of those then called tub-women. The brewer, observing a well-looking girl in this low occupation, took her into his family as a servant, and after a while, she behaving with so much prudence and decorum, he married her; he died when she was yet a young woman and left her a large fortune. The business of the brewery was dropped, and the young woman was recommended to Mr. Hyde, as a gentleman of skill in the law, to settle her affairs. Hyde (who was afterward the great Earl of Clarendon), finding the widow's fortune very considerable, married her. Of this marriage there was no other issue than a daughter, who was afterward the wife of James II, and mother of Mary and Anne, queens of England." How some of our codfish aristocrats would turn up their noses to be told they had such a modest origin as had this woman.

NEW VIEW OF THE DISCOVERY OF AMERICA.—At a recent examination of a group of "one-year volunteers" in the Grand Duchy of Baden, the examiner asked a young country fellow if he could tell him anything about the discovery of America. The youth answered that the late Pope Pius IX had succeeded in collecting indubitable proofs that Christopher Columbus, inspired by his zeal for the Church and the Faith, was eager to discover a shorter route to the holy sepulcher, and that during his explorations in pursuit of this object, he discovered America by acci-

dent. The examiner, astounded and indignant at such a reply, asked him where he had found all this nonsense. The youth answered that it was no nonsense, for he had only lately read it in the *Badischen Beobachter*, No. 222, 1879. This explanation, like the answer of the theological candidate in the *Jobsiad*, produced a universal shaking of heads. The newspaper in question is the leading Ultramontane organ in the grand duchy. The special number which the young volunteer had quoted as his authority was obtained, and the passage stood there exactly as he had quoted it. It was a translation from an article in a Belgian religious magazine, giving an account of the progress of the movement for the canonization of the discoverer of America. The Belgian writer adds that it was "the magnificent idea of Columbus, after his discovery of America, to conquer these new lands for the Church, to win their souls and their treasures for the kingdom of Christ, and to expend the latter in the purchase of the holy places of Palestine, and afterward to offer these latter as a present to the pope. The same authority adds that Columbus further hoped that he and his descendants would be nominated by the pope to the office of "Stadthalter," and "perpetual protector of the holy sepulcher." All these things, as the writer convincingly concludes, show that it was partly a thought of faith which guided Columbus to the discovery of America, held him upright in the midst of a thousand dangers, and consoled him against numerous acts of ingratitude. Such is history within the domain of priestly education.

In the Australian Forest.—A recent traveler in those wilds furnishes *Chambers's Journal* this beautiful description: Morning and evening the Australian forest is awake; at noon it is asleep. No greater contrast can be imagined than between the morning hours and those at midday. In the former, the very flowers seem to possess an active existence. Myriads of such, larger and more brilliant than those under English skies, load the air with the sweetest scents; magnificent tree-ferns wave their fronds or branches in the light breeze; on old stumps of trees, great green and yellow lizards lie watching for their prey; the magpie throws her voice from the wattles, and possibly the lyre-bird in the denser scrub; and in the tall gums numberless paroquets, parrots, rosellas, cockatoos, butcher-birds, love-birds, etc., are screaming and darting to and fro. But by and by the intense heat will silence all these, and nothing will be heard but the chirp of the grasshopper and the shrill sound of some unseen insect. At twilight again there is a revival of life, but not of so cheerful a description. The cicadas shriek by myriads their deafening "p–r–r–r–r–r;" drowsy opossums snarl in the gum-holes, and flocks of cockatoos scream as some great gray kangaroo bounds past them like a belated ghost. If there is a marshy ground near, the deep boom of the bittern, the wail of the curlew, and the harsh cry of crane mingling possibly with those of a returning or passing flock of black swans, will add to the concert. In a moment of silence one may be startled by the mocking laughter of the jackass or the melancholy "mo poke" (or "more-pork") of the bird of that name. The dead of night is not so still as the universal hush of the burning noon.

Ireland's Distress.—A whole nation is starving and right in the midst of a civilized neighborhood. This is the bald fact. One baroness (Burdett-Coutts) gave five hundred thousand pounds, equal to two million five hundred thousand dollars to the amelioration of the distress in Ireland. No such contribution would be made nor be considered necessary if distress were moderate or limited. The truth is, Ireland is starving, and the civilized world should help. A member of Parliament, a politician, too, has come across the sea to enlist our sympathy by personal appeal. A needless course, this of Mr. Parnell, and we hope he will go back as he came, but a nation's royal contribution go before him. We are linked with the people of Ireland by ties as strong as those with England. We should fail of our duty as brethren were we to forget the Wesleyans of the Green Isle. Yes, not to them alone should our help go, but to all who need. "Humanity," James Morrow, of Philadelphia Conference, has well said, "is more than a denominational proclivity."

Endowment for Mechanics.—A singular and yet a very sensible gift is that of Lothar von Faber, the well-known German lead-pencil manufacturer. He has just presented the sum

of one hundred and twenty-five thousand marks to the city of Nuremberg, the interest on which he requires to be paid annually to some intelligent, skillful, and in all respects worthy mechanic, for the purpose of establishing him in an independent business. The recipient must be of respectable family, a resident of Nuremberg, or Stein, and must have attended the schools in one of those towns. Amidst the poverty of the European laboring classes such a gift has far greater significance than we can well imagine in a country so rich naturally and so largely undeveloped as ours is, and yet even here many a mechanic might be profited by such a gift.

Old Bells Tolling their Last.—It has been resolved to melt the old church bells in St. Peter's, at Zurich, and to cast new ones from the old metal. One of the set, however, known as "Schlagglocke" was cast in 1294, and is, therefore, fifty-seven years older than the union of Zurich with the Swiss Republic, which took place in 1351. Efforts have been made by the Antiquarian Society to save the bell from destruction, and they ought to succeed.

A Princely Folly.—The author of "Women in France in the Eighteenth Century," says of the court of Louis XV: "At one time the whole court was thrown into a great commotion by a sudden fancy which the king took for worsted work. A courier was instantly dispatched to Paris for wool, needles and canvas. He only took two hours and a half to go and come back, and the same day all the courtiers in Versailles were seen, with the Duke of Gesores at their head, embroidering like their sovereign. What fools these princes be!"

ART.

REVOLUTION versus FASHION.

Mr. Joseph Bennett has been giving a series of articles in the *Musical Times* on "The Great Composers, sketched by themselves.' During the progress of these sketches have appeared some most choice bits of musical criticism, gleaned from the conversations of the great musicians, to which good heed should be given by those who are forever running after mere novelties to the neglect of the true and good in the works of the old. In a recent installment on Mendelssohn occurs the following on "revolution" in art:

Dwelling a little while longer upon the Düsseldorf letters, we find in one of them, addressed by Mendelssohn to his sister Fanny, a remarkable opinion upon an abstruse question of art. Frau Hensel, it appears, had heard the violinist, Lafont, and, addressing her brother, had spoken of the "revolution in violin playing" since Paganini. Against this idea of revolution Felix protested with all his might, saying: "I don't admit that any such thing exists in art, but only in people themselves; and I think that very same style would have displeased you in Lafont if you had heard him *before* Paganini's appearance; so you must not, on the other hand, do less justice to his good qualities after hearing the other. I was lately shown a couple of new French musical papers, where they allude incessantly to a *revolution du gout* and a musical transaction which has been taking place for some years past, in which I am supposed to play a fine part; this is the sort of thing I do detest."

Mendelssohn's sisters—Rebecca joining in the argument—appear to have combated his notion of subjective as opposed to objective change, and hence the master quickly returned to the charge in a letter which deserves very careful consideration. He said, addressing Rebecca:

"I . . . must absolutely resume the question of *revolution*, though this is chiefly meant for Fanny; but are you not identical? . . . and have I not pondered and brooded much over this theme since I got your letter, which now prompts me to write? You must, however, answer me in due form, till not one jot or tittle remains to be said about *revolution*. Observe, I think there is a vast distinction between reforming or reformation and revolution, etc. Reformation is what I desire to see in all things, in life and in art, in politics and in street pavement; and heaven knows in what

else besides. Reformation is entirely negative against abuses, and only removes what obstructs the path; but a revolution, by means of which all that was formerly good (and really good) is no longer so, is to me, now as ever, the most intolerable of all things, and in fact only a fashion. Therefore, I would not for a moment listen to Fanny when she said that Lafont's playing could inspire no further interest since the revolution effected by Paganini; for if his playing ever had the power to interest me, it would still do so, even if in the mean time I had heard the angel Gabriel play upon the violin. It is just this, however, that those Frenchmen I alluded to can have no opinion of—that what is good, however old, remains always new, even though the present differs from the past because it emanates from other and dissimilar men.

"Inwardly they are only ordinary men like their predecessors, and have only outwardly learned that something new must come, so they strive to accomplish this, and if one of them is moderately applauded or once in print, he instantly declares that this is a *revolution du gout*. This is why I behave so badly when they do me the honor (as you call it) to rank me among the leaders of this movement, when I well know that for thorough self-cultivation the whole of a man's life is required (and often does not suffice); and because no Frenchman and no newspaper knows, or ever can know, what the future is to bring; and, in order to guide the movements of others we must first be in motion ourselves, while such reflections cause us to look back on the past, not forward. Progress is made by work alone, and not by talking, which those people do not believe."

This is a long quotation, but its importance is equal to its length, since it shows us very clearly what was Mendelssohn's opinion upon a question even more prominent now than in his day. The master believed that whatever was good in music at its creation remains good forever; that its excellence is inherent and unchangeable, and can not be affected by subsequent events. It may go out of fashion and be laid up in a store as a curious exemplification of ancestral weakness, but this is a change in public taste, not in the thing itself. Hence, strictly speaking, there can be no revolution in art, but only in the minds of those who regard it. Mendelssohn held this so strongly that he could not alter—a fact set forth with singular vividness in his assertion that what he once thought good in old-fashioned Lafont he would continue to think good, though the angel Gabriel set a different style. We can not all be Mendelssohns, but in proportion as right views obtain about art will the public mind approximate towards Mendelssohn's belief in this matter. At present music is to a large extent the sport of fashion. A man here and a man there starts up with a novelty, and the heedless crowd turn their backs upon their former idols to go and worship at the new shrine. Meanwhile truly enlightened amateurs have the satisfaction of knowing that the good, though unfashionable things, remain as good as ever; and that, if revolutions must go on, the turn of that which is now despised will sooner or later come again.

A FRENCH STUDIO.

UNDER the above head a correspondent of the *Independent* gives a very interesting letter upon Julian's studio in Paris, and conveys to us some idea of the discipline through which the student has to pass in order to attain to excellence in these competitions. Being one of the number, we are to presume upon the accuracy of the account. We quote a portion of this routine:

"At eight o'clock one may see by the light from the great window in the roof some sixty students. The beginners are already at work from a row of casts at the end of the room. The remainder, while waiting for the pose, increase the Babel, and send up clouds of tobacco-smoke. A group of models stand by the door, anxious for a week's engagement. Each has his specialty. Almost all are Italians. One has beautiful limbs; another poses crucifixions and scourgings; this is an Apollo; that a Madonna. A model is chosen and his pose voted. Our names are called from the morning's list. As each takes his place, he fences in his especial territory by a white chalk line, inscribing his name upon the floor, and work begins. The model holds his position for fifty minutes of each hour, from eight to twelve, and from one to five, when it is light so long. On Wednesday morning at eight the professor comes, and again on Saturday. He takes the place of each student and corrects his work

generally with a word, sometimes taking the charcoal and the palette. Each pupil receives perhaps two minutes of personal instruction from a professor each week. The most of our instruction comes, therefore, from fellow-pupils, many of whom have studied for years and have received medals from the beaux arts, or have been even received in the *concours* for the *Prix de Rome*.

"The professors do not come the fourth week of each month. That is, the week in which the best drawing or painting from the two studios receives a medal and one hundred francs. The students take their places not as before, in order of arrival, but according to their rank in a preparatory *concours* of original composition which takes place the second Sunday of each month. The subjects of these compositions, are chosen by a professor, and are drawn generally from mythology or ancient history. Those students who have tender consciences are allowed under certain restrictions, to make their sketches the following Monday, in order to gain a place in the strife. A prize of fifty francs is given each month to him of the two studios who has done the best drawings and original compositions during the three weeks preceding *concours*. The drawings are made upon cheap charcoal paper, about 18x24 inches, attached by spring clothes-pins to the portfolios in which they are inclosed at night.

"The pupils come from the four quarters of the globe. Three-fourths are Frenchmen; then, numerically follow the English and Americans. The latter take more than their proportion of honors. In the last *concours*, to which forty of the hundred or more pupils of the two studios were admitted, Gordon Greenough, son of the sculptor, of Newport, received the prize, and four out of the eight classes were Americans—one of them a lady. One of our strongest men is a typical Yankee. He was born in Concord and graduated at Harvard. He has mined in Nevada, taught school in California, and he came abroad in the steerage. . . .

"Occasionally a noted Englishman drops in and out again, before we know what angel we have entertained; or rather what angel has entertained us, for have we not all drunk of his punch? Some two months since an elderly gentleman appeared, who signed the Monday list as Mr. Temple. He was tall and had a little lisp and a little eye-glass, a well-trained mustache, and a gold-headed cane. He called the young ladies "my dear" in the most fatherly manner. One of them, in her reading, mixed the Bourbons; he kindly disentangled the branches during the posing of the model one Monday, and was graciously complimented by her upon his astonishing memory. No one paid much attention to Mr. Temple, for he did not draw very well, and that is the only distinction in our democracy; but he was voted a gentleman, and he paid an extra punch on departing. We now know that he who passed for Mr. Temple was no other than Lord Dufferin, late governor-general of Canada, and that he was called away as minister from the court of St. James to St. Petersburg. Lord Dufferin told a gentleman who was in the secret of his incognito, that he had enjoyed hugely going down in the early morning and 'roughing it' with the rest."

ART NEWS.

MR. JARVES reports from Florence the encouraging fact that two successful art schools are conducted in that famous art center by two young American artists. They are of such thoroughness in appointments as almost to rank as academies. One is for design, conducted by Mr. Van Schaick, of New York, who has been thoroughly trained in the best system of French scientific drawing. The other is for painting, under the direction of Mr. Duveneck, educated at Munich, who has brought twenty pupils with him from that center and home of art. The most surprising fact is, that both schools have many English and Italian pupils, chiefly women, and the proprietors are obliged to turn away applicants for lack of proper accommodations.

—The recent severe fires in Boston were especially disastrous to the Heliotype Printing Company, J. R. Osgood, manager. It is well known that some seven years since Mr. Osgood secured the patents for this process and brought the inventor to Boston to superintend this new business. The efforts of this house to introduce reproductions of noted art works by the Heliotype process have been remarkably successful. The works of the great masters, as Raphael, Correggio, Titian, Landseer, Dürer, etc., have been made familiar to the American

public, and a most positive influence for good has been thus exerted. Besides this, nearly three hundred of the most striking of the Gray collection of engravings have been placed on the American market, and thus in cheap form have copies of these masterpieces found their way into ten thousand American homes, stimulating their inmates to new inquiries and more thorough studies. We are glad to learn that this Company is soon to re-commence its work and to favor the public with yet other and finer displays than before. We can not but wish this firm all success in this work.

— The Royal British Academicians have recently elected A. H. Church chemical professor to the Royal Academy. This gentleman has achieved a very high reputation in science, and is, moreover, an artist of very considerable ability, who has contributed on several occasions to the Academy exhibitions. He must, therefore, have practical acquaintance with artistic needs such as few other chemists would be likely to possess; and when we add to this that he has long made the chemistry of colors a subject of study, it will be seen that he has very special qualifications for the post he now occupies, and that much valuable instruction may be expected from his lectures. The titles of his subjects will give the scope of the course, and illustrate how closely connected are the abstractly æsthetic with the practical arts. It will also be seen how important is this knowledge to the beauty and permanence of the works of our hard-toiling artists. His first two lectures are on "pigments," their composition, properties, and tests. The next on "oil, wax, paraffin, gum, and other vehicles and varnishes;" the next on "canvas, wood, paper, and painting grounds in general, and on the conservation and restoration of pictures;" the next on "marble, stone, wood, and the materials of sculpture and architecture;" and the last on "metals, enamels, etc., used in the fine arts."

— At the international competition opened last year at Philadelphia for a monument to Washington, the design of Professor Siervering, of Berlin, carried off the prize, and he was accordingly intrusted with the execution of the monument. He now fears, however, that the one hundred and eighty thousand dollars subscribed for this purpose will not be sufficient for the expenses of getting it into position.

NATURE.

Little Fishes.—In a recent government report on United States fish and fisheries are some interesting facts concerning the menhaden: The menhaden, called by naturalists *Brevoortia tyrannus*, has many local names. In Maine and Massachusetts it is generally called the "pogy," though on Cape Ann this term is partially replaced by "hard head." The name menhaden is exclusively applied in Vineyard Sound, Buzzard's Bay and Narragansett Bay. Along the Connecticut coast east of the Connecticut River "bony-fish" predominates, but in the western part of the State the species is known as the "white-fish." In our New York waters the term "moss-bunker" has the sanction of two centuries of usage, and is a corruption of the Dutch word *marsbancker*. In Delaware and Chesapeake Bays and on the Potomac the fish appears under the aliases of "alewife" and "green-tail;" in Virginia it is called the "bug-fish," in North Carolina the "fat-back," and farther South the "yellow-tail." This little fish is used as food to such a limited extent that its commercial importance is not appreciated by people who do not live upon the Atlantic coast; yet the catch is a quarter of a million of tons annually, far exceeding in weight that of any other species, and surpassed in money value only by that of the cod, the mackerel, and the salmon. No other fish is put to such manifold uses. It yields more oil than all the whales caught by American fishermen. The refuse of the menhaden oil factories supplies a valuable manure, and enters largely into the composition of most artificial fertilizers. The amount of ammonia derived from this source in 1875 was estimated to be equivalent to that contained in sixty millions of pounds of guano from Peru, the value of which would be nearly two millions of dollars. It is the chief bait used by the mackerel fleets of the United

States and Canada. A "fish meal" is made from it, which is an excellent food for domestic animals. A substance possessing all the qualities of Liebig's extract of beef is obtained from it. The farmers along the coast salt it down for Winter food; and finally the young fish are put up in cotton-seed oil and sold as "American Sardines."

The menhaden seems to be made rather to be eaten than to eat. Man, with his instruments for wholesale destruction, takes six or seven hundred millions of these fish annually, but he is only one among its many enemies. Whales follow the schools and consume great numbers. The great bone whale swims below a school, and suddenly coming up to the surface in the thickest of it swallows hogsheads of menhaden at a gulp. A shark will stow away as many as a hundred in his capacious stomach. The horned dogfish, the tunny, the silver hake, the striped bass, the weakfish, the garfish, the swordfish and the cod make havoc among them. Their most redoubtable enemy, however, is the bluefish, or snapping mackerel. These corsairs of the sea, not content with what they eat, which is of itself of enormous quantity, rush ravenously through the closely crowded schools, cutting and tearing the living fish as they go, and leaving in their wake the mangled fragments. Traces of the carnage remain for weeks in the great "slicks" of oil so commonly seen on smooth water during the Summer season. The terrified fish fly in every direction, and are often driven ashore in such numbers that the farmers gather them up with pitchforks and shovels, and carry off cart-loads to manure their land. Professor Baird estimates that ten thousand millions of menhaden are daily consumed by bluefish on the coast of New England only, during a period of four months in the Summer and Fall. An estimate of the whole number destroyed annually in the waters of the United States places the amount at the enormous figure of three thousand millions of millions. "It is not hard," says the report, "to surmise the menhaden's place in nature; swarming in our waters in countless myriads, swimming in closely packed, unwieldy masses, helpless as flocks of sheep, close to the surface and at the mercy of any enemy, destitute of means of defense or offense, their mission is unmistakably to be eaten. In the economy of nature certain orders of terrestrial animals, feeding entirely upon vegetable substances, seem intended for one purpose—to elaborate simpler materials into the nitrogenous substances necessary for the food of other animals. So the menhaden, deriving its own subsistence from otherwise unutilized organic matter, is preeminently a meat-producing machine. Man takes from the water annually six or seven hundred millions of these fish, weighing from two hundred and fifty to three hundred thousand tons, but his indebtedness to the menhaden does not end here. When he brings upon his table bluefish, bonitos, weakfish, swordfish, bass, codfish, what is he eating? Usually nothing but menhaden."

WHAT IS A COLD?—A late number of the *Lancet* presents some novel ideas concerning colds. It is startling to discover how little we know about the commoner forms of disease. For example, a cold: what is it? How is it produced, and in what does it consist? It is easy to say a cold is a chill? We know by daily experience that the body, as a whole, or any of its parts, may be reduced to a considerably lower temperature than will suffice to give a man a cold if the so-called chill be inflicted on the surface suddenly, because few of the most susceptible would take cold from simply handling a piece of cold metal or accidental contact with ice; therefore, sudden reduction of temperature is not the cause of cold. The truth would seem to be that what we call cold-taking is the result of a sufficient impression of cold to reduce the vital energy of nerve centers presiding over the functions of certain organs. If this be the fact, it is easy to see why nature has provided the stimulus of a strong fit of sneezing to rouse the dormant centers and enable them at once to resume work and avoid evil consequences. This explains why the worst effects of cold do not, as a rule, follow upon a chill which excites much sneezing. Shivering is a less effective convulsion to restore the paralyzed nervous energy, but in a lower degree it may answer the same preventive purpose. It follows from these observations that the natural indication to ward off the effects of a chill is to restore vital energy of the nerve centers. The *Lancet* next adds that there is no more potent influence by which to attain this

object than a strong and sustained effort of the will. "The man who resolves not to take cold seldom does."

THE USES OF THE POTATO.—In France the farina is largely used for culinary purposes. The famous gravies, sauces, and soups of France are largely indebted for their excellence to that source, and the bread and pastry too; while a great deal of the so-called cognac, imported into England from France, is distilled from the potato. Throughout Germany the same uses are common. In Poland the manufacture of spirits from the potato is a most extensive trade. "Stettin brandy," well known in commerce, is largely imported into England, and is sent from thence to many foreign possessions as the produce of the grape, and, indeed, is placed upon many an English table as the same; while the fair ladies of our country perfume themselves with the spirit of potato under the designation of *eau de Cologne*. But there are other uses to which this esculent is turned abroad. After extracting the farina, the pulp is manufactured into ornamental designs, such as picture-frames, snuff-boxes, and toys, while the water that runs off from it during the process of manufacture is a most valuable scourer. Few persons are aware of the great demand for potato flour, and the almost unlimited extent of the market that can be found for this product, which is simply the dry evaporated pulp of the ordinary potato. It is used for sizing and other manufacturing purposes, and by precipitation with acid it is turned into starch. In Europe it meets with an increasing demand in its primitive state, as potato flour—in Lancashire alone twenty thousand tons being sold annually. When calcined it is used largely for dressing silk.

THE HEART AS A MACHINE.—The heart is probably the most efficient piece of physical apparatus known. From a purely mechanical point of view it is something like eight times as efficient as the best steam engine. It may be described mechanically as little more than a double force pump furnished with two reservoirs and two pipes of outflow; and the main problem is hydro-dynamical. The left ventricle has a capacity of about three ounces, and beats seventy-five times a minute; and the work done in overcoming the resistance of the circulating system is equivalent to lifting its charge of blood a little short of ten feet. The average weight of the heart is a little less than ten ounces. The daily work of the left ventricle is, in round numbers, ninety foot-tons; adding the work of the right ventricle, the work of the entire organ amounts to nearly one hundred and twenty-five foot-tons. The work of the heart is, accordingly, equivalent to lifting itself twenty thousand feet per hour. An active mountain-climber can average one thousand feet as ascent an hour, or one twentieth the work of the heart.

INSTINCT OF THE HORNET.—A black hornet was observed one day a few weeks ago flying in a sitting-room. The occupant of the room noticed that the insect deposited a small piece of mud on the wire supporting a picture-frame. It was not disturbed, and it repeated the operation five or six times a day until it had built a cell about one inch long, with a cylindrical cavity three eighths of an inch in diameter, in which an egg was laid and, the end then closed. This process was repeated until six cells had been completed in like manner, when the hornet laid aside its trowel and betook itself to other fields of labor. The nest was soon removed, and was found to contain larvæ in various stages of development, from the full-grown chrysalis in the cocoon to the young larvæ just hatched. There were three larvæ partly changed to the chrysalis form and in these cells were the remains of several spiders. In the cell with, and placed above the youngest larva, were fourteen spiders, some of them quite large, and the larva appeared large enough to have eaten half a dozen.

PRESERVING MILK.—Herr Maurice Philipp, of Reisbach, Zurich, has apparently discovered a plan of keeping milk good and fresh in any temperature for long periods. The details of the plan are not yet announced, and it is impossible to say whether the process is likely to be a commercial success. About the scientific success there seems to be no doubt. Three months ago Mr. Philipp placed in the hands of the chemical agricultural commission of Zurich a bottle containing a sample of his preserved milk, by whom it has been submitted to the severest tests. It was placed eight days in an ordinary room, the temperature of which during the day rose sometimes as high as seventy-five degrees Fahrenheit, without percept-

ible effect on its quality, taste, or appearance. It creamed like any other milk, and butter might have been made from it had it been thought desirable to do so. The same favorable results were obtained at various intervals throughout the three months in question, and the most careful tests of Dr. Grete, president and analyst of the commission, failed to detect in the milk any doubtful ingredient such as some experimenters have occasionally used for purposes of milk preservation. The analysis gave the following results: Specific gravity, 1.0285; water, 86.58; solid matters, 13.42 per cent. The latter consisted of caseine and albumen, 3.80; fatty substances, 3.72; milk sugar, 4.76; ash, 0.74, and sundry organic matter, 0.40 per cent.

ICE IN THE SICK-ROOM.—Mention is made in a foreign paper of a plan pursued by an ingenious physician for insuring a supply of ice for use in sick-rooms during the hottest nights, and without disturbing the patient. This plan is to cut a piece of flannel about nine inches square, and secure it by ligatures round the mouth of an ordinary tumbler, so as to leave a cup-shaped depression of flannel within the tumbler to about half its depth. In the flannel cup so formed pieces of ice may be preserved many hours—all the longer if a piece of flannel from four to five inches square be used as a loose cover to the ice-cup. Cheap flannel with comparatively open meshes is preferable, as the water drains easily through it, and the ice is thus kept quite dry.

RELIGIOUS.

PASTORS WITHOUT WORK—There are eleven hundred and thirty-six Congregational ministers in this country without a charge, and the serious questions what to do with them, and why are things thus, are forcing themselves into earnest discussions. It is estimated that about two hundred and fifty of these ministers are not in positions to accept any charge, and that some of them, perhaps, do not desire one; but after all such allowance is made, there remain nine hundred ministers still unemployed. Statistics indicate as an offset, that there are six hundred and sixty-two Churches which have no pastors, about sixty of which are unable, it is supposed, to support one—showing six hundred pastorless Churches able to support a pastor if they would, and nine hundred churchless pastors willing to take charge of a Church if they only had a chance. Evidently there is fault somewhere. *The Congregationalist* has published letters from several of the pastors without charges, some of whom have not only failed to get a Church, but are unable to support themselves in another way. One says he would saw wood or do any thing to earn a living, while the income of another is given as three dollars a week—all this after years of study in colleges and seminaries to fit them for ministerial work. What about the uselessness of our itinerant system?

THAT LITTLE CHURCH CALLED THE REFORMED EPISCOPAL.—It will certainly not take very long to make a strong body of it, if whole congregations shall continue to come into its fold as recently was the case in Dundee, Scotland, where an Episcopal congregation unanimously asked for admission. In Chicago, Illinois, there are now eight of its Churches, of which two possess property valued at between seventy-five thousand dollars to one hundred thousand dollars, and all this free from debt. Rather novel is the proposition started by Reformed Episcopalians that the office of bishop be limited to ten years, after which, if not re-elected, each bishop shall return to the ranks of the clergy. How would such a practice work in our body? We fear the Reformed Church is not taking fairly into consideration the growth of future days. Episcopal elections beget excitement enough without repeating it after a candidate has once been put into office, and besides it is not always a pleasant matter to turn on your bishop.

RELIGION ON THE STAGE.—At an Episcopal college, in Western Flanders, a remarkable religious play was recently performed by the pupils of the school before their parents, and received with much applause. In the first act a pupil in the dress of a Freemason, was seen

digging a grave, in which a coffin marked "Catholicism" was to be placed. He was assisted by the Belgian minister of public instruction in the character of Satan. In the second act the grave-digger appeared as the teacher of a public-school. The father of four sons entered with the boys, and made a bargain by which he was paid a certain sum of money for permitting his boys to attend the school, and with the money in his pocket went away, leaving them behind. The education of the boys was begun in another act by writing on the blackboard "There is no God," and teaching them to understand the words. In a few moments an old man appeared with a boy; then an angel with a scepter and Satan in flames came in, one after the other. The pupils soon fell to the floor, and the angel sang the clerical war song: "Thou shalt not have it, the beautiful soul of the child." Satan was then put to flight, and the children were saved.

DEATH OF JOHN RATTENBURY, THE WESLEYAN PREACHER.—No greater man in work and worth did the English Wesleyans count in their ministry. He began preaching in 1825, and for more than half a century of public life never failed of success. He held all his appointments until obliged to leave it by the legal restrictions and returned to the same places repeatedly as soon as the brethren would consent. For the last six years he was especially devoted to the interests of the *auxiliary fund*, and to provisions for the support of supernumerary preachers and widows, and by his own efforts reported as raised at the last conference the handsome amount of one hundred thousand pounds, about five hundred thousand dollars. In 1861 he was president of the convention. His work was done and well done. He has gone to the reward of the faithful.

GIFT TO WESLEYAN UNIVERSITY.—The recent handsome gifts to Rochester University are followed closely by an announcement of a further gift to our own time-honored *Wesleyan University*, at Middletown, Conn. It comes from Mr. George I. Seney, of New York, who adds to the fifty thousand dollars which he gave last Autumn, the pretty sum of seventy-five thousand dollars, both amounts being in first mortgage railroad bonds, bearing interest at six per cent. In a private note to President Foss, Mr. Seney says: "I am only fulfilling a vow made years ago to 'remember Wesleyan University.' I have the highest regard for the college, and most sincerely wish it prosperity. Its history and its faculty, past and present, are an honor to our Church and country; and I firmly believe its graduates will compare favorably with those of any college in the land." The university has now secured three-fifths of the Centennial Endowment, five hundred thousand dollars, which it recently asked for, and of which it stands much in need. What, with Andrew V. Stout, Oliver Hoyt, and George J. Seney for donors and sponsors, the Wesleyan will do in the next decade which will complete its half century of existence, we may rightly conjecture now.

THE FOUNDER OF AMERICAN SABBATH-SCHOOLS DEAD.—At Montrose, Penn., there died recently Burr Baldwin, a minister who, in several ways, was remarkable. He was ninety-one years of age, and belonged to the class of 1809 at Yale, being, it is believed, the oldest surviving graduate of that college. He founded early in the century the American Sabbath-school system, and organized at Newark, N. J., the first school. There was an application at the time by a colored woman for admission, and much apprehension was felt by his associates in consequence of it, since they feared that her admission would endanger the success of the school and the entire system at its very start. The woman was, however, admitted, and not long after a school was started for the education of colored teachers, which led eventually to the birth of the American Colonization Society.

"LITTLE AMONG THE THOUSANDS" STILL.—It is often a noticeable circumstance, says a contemporary very acutely, that when a Congregational minister leaves his denomination and goes over to the Episcopal Church, he is apt to think himself only the center of a groundswell which is soon to land a great multitude of his former brethren near the place where he now is. We have watched this progress for many years, but we find as a matter of fact, that the Episcopal Church in this country still remains "little among the thousands of Judah," numbering about three thousand local parishes of the nearly sixty

thousand Protestant Churches of all denominations scattered over the broad land. Moreover, we do not discover, by glancing back over the last twenty years, that the relative growth of the Episcopal Church is at all beyond that of other denominations.

A WANT OF COURTESY IN CHURCHES.—The want of Christian courtesy in many Christian Churches, especially in cities, is so astonishing, that it is made the basis of sensible comment by the "Churchman." In some cases even cultivated families may attend for years and not obtain the slightest recognition. Now, there may be excellent preaching, and every thing, so far as the worship is concerned, entirely congenial, but what does it signify when you are no better than a Samaritan among the Jews? When a family has attended a Church six or eight years and never received so much as a word of welcome, it comes to be a little tedious. People naturally want to know by certain external signs whether the communion of saints means any thing, and whether, if it mean nothing here, it may mean any thing hereafter.

WHAT OF THE NIGHT IN FRENCH PROTESTANTISM?—French opinion against Romanism is strengthening. On a recent Sunday night, when "Martin Luther" was performed in a Paris theater, the manager before the play began started to offer some remarks on Luther's wife, but the audience shouted him down and insisted that the play go on. Protestant journals record the fact that several passages favorable to Protestantism were "greeted with thundering applause," and that every appearance of Luther on the stage called out similar expressions of approval. A republic can hardly foster long the narrow views of the Romish hierarchy, and the day of civil liberty dawns not long before the day of religious freedom, and what a day of glorious light that will be for France! God speed the hour.

RELIGIOUS MISCELLANY.—There are 64 societies of Swedenborgians in England, with 4,987 members. The Mormons have 82 churches, and the Jews 90 synagogues and 150 ministers. The Baptists have, in Great Britain and Ireland, 3,451 churches, 1,876 ministers, 276,348 members, and 399,317 scholars in the Sunday-schools. They have 10 colleges, employing 27 tutors and professors. The Scottish Episcopal Church has seven bishops, 212 churches, and 225 clergymen, against 1,639 ministers, and 1,530 churches belonging to the Established Church of Scotland.

— The Church of England has 2 archbishops, 28 bishops, 4 suffragan bishops, 30 deans, 74 archdeacons, 610 rural deans, 23,000 clergy of all classes, one-fifth of whom have no parochial charge. One archbishop—Canterbury—and 24 bishops have seats in the House of Lords. The income of the prelates range from $75,000 to $12,000 a year; that of the deans $15,000 to $1,025. The number of churches is about 16,000. Gross income of the Church from all sources is $40,000,000 per annum.

— It is estimated that among the English-speaking population of the world there are 18,000,000 Episcopalians, 16,000,000 Methodists, 13,500,000 Roman Catholics, 10,250,000 Presbyterians, 8,000,000 Baptists, 6,000,000 Congregationalists, 1,000,000 Unitarians. Of minor religious sects there are 1,500,000 adherents, and 8,500,000 are of no particular religion.

— In this country "The Baptist Year Book for 1880" shows a large increase of members in their denomination, North and South. The total of members reported is 2,133,044, against 2,102,034 last year, showing an increase of 31,010. There are 1,095 associations—increase 20; 26,794 churches—increase 295; 15,401 ordained ministers—increase 447. The additions by baptism were 78,994, a falling off of upward of 33,000 from last year. The exclusions numbered 20,580.

— The society for Irish Church Missions to Roman Catholics in Ireland has raised £645,-609 in the last 26 years. In addition it has been the means of erecting 19 churches, nine parsonages, 33 school-houses, and 8 orphanages. Its agents now number 386, comprising 30 clergymen, 124 Scripture readers and schoolmasters, and 132 other agents.

— The Mormons have made considerable progress with converts in Mexico, and it is said that efforts to found a Mormon colony in that country will be put forth. We are inclined to sing: "*Let thy people go!*"

— A bishop of the Armenian Church, from Turkey, visiting London, represents that many Armenians are desirous of giving up the superstitions of their own Church and connecting themselves with the Church of England.

CURIOUS AND USEFUL.

THE ART OF LEAVING. — It is Disraeli who, in "Lothair," puts into the mouth of Theodora the sentiment that no one should ever say good-bye, but in departing should fade away like a Summer cloud. We have often been constrained to wonder whether the Earl of Beaconsfield wrote this after an interview with a friend who understood not the art of leaving. For in the narrowest and choicest circle of friends and acquaintances there are usually some persons whose visits or calls, whether on business or pleasure, are marred by the fact that they do not seem to know how to go. Schiller wrote to Goethe concerning the visit of Madame de Stael to the court of Weimar. "She ought to know when it is time to go;" and from what we learnt of that good lady's departure we infer that at the time of her going she still further bored the great poet by her tedious farewells. For when a friend departs we are either glad, sorry, or indifferent. If we are glad, we desire to be brief; if we are sorry, the quicker the painful scene is ended the better; if we are indifferent, we grudge the draft upon our time, if we are busy with the pressing affairs of life, as the most of us are. The art of leaving is, as a general thing, less understood by women than by men. The habits of business, the recognized fact that to a business man time is money, the throng and press and exactness of business life all tend to make men the best possible exemplars of the fine art of leaving at once. A business man's call is usually a model of good manners in this respect. When he has said what he has to say, he takes his hat, says "Good evening," and is out of your presence, without giving any time or chance for the too often tedious and embarrassing commonplaces of mutual invitations to call, which seem to be a kind of necessary social formula. In striking contrast to this neat and skillful method of cutting short an interview is the too common social practice of visitors who, when about beginning to leave, seem temporarily to abandon the purpose, and then follow it up by a number of unsuccessful attempts to accomplish their intention, as though it were a kind of compliment to the person visited to appear loath to part company. Who can not at once recall the visitor who starts, then thinks of something else to say, rises and thinks of another subject of conversation, gets nearly to the door and receives another revelation; reaches the door, and, most probably holding it open, is aroused to a degree of mental brilliancy that threatens his own health and that of his host by long detaining both in a cold draught while he discourses? What a tax on the patience and politeness of the listener who vainly strives by assenting instantly to every proposition to end the interview and break the restraining bond of polite attention.

WOMAN'S SUPERIOR MENTAL IMAGERY.— An English writer treating of this topic says he has been astonished to find how superior women usually are to men in the vividness of their mental imagery, and in their powers of introspection. "Though I have admirable returns from many men, I have frequently found others, even of the highest general ability, quite unable for some time to take in the meaning of such simple questions as these: 'Think of some definite object, say your breakfast table as you sat down to it this morning, and consider carefully the picture that rises before your mind's eye. Is the image dim or fairly clear? Is its brightness comparable to that of the actual scene? Are the objects sharply defined? Are the colors quite distinct and natural, etc.?' On the other hand, I find the attention of women, especially women of ability, to be instantly aroused by these inquirers. They eagerly and carefully address themselves to consider their modes of thought, they put pertinent questions, they suggest tests, they express themselves in well-weighed language and with happy terms of expression, and they are evidently masters of the art of introspection. I do not find any peculiar tendency to exaggeration in this matter either among women or men; the only difference I have observed between them is, that the former usually show an unexpected amount of intelligence, while many of the latter are as unexpectedly obtuse. These mental differences

between the two sexes seems wider in the vividness of their mental imagery and the power of introspecting it than in respect to any other combination of mental faculties of which I can think."

SILK CULTURE IN THE UNITED STATES.—Dr. Samuel Chamberlaine urges in the *Journal of the Franklin Institute* the desirability of silk culture in the United States. There is, he says, in this country an established business in silk manufacturing which employs at least two hundred firms and some twenty thousand operatives, who use up a million pounds of raw silk every year. This silk now costs five millions of dollars, an amount which will soon be doubled, and even quadrupled in the near future. Dr. Chamberlaine thinks all this raw material might readily be produced in this country, and a large part in Pennsylvania. He urges the establishment of a fostering central society at Philadelphia which should encourage the raising and reeling of silk as a "cottage culture." In this way, by carefully nursing the new industry and avoiding the mad speculation of 1840, he thinks the United States would become a silk growing as well as a silk manufacturing country.

ASCETICISM AND NUDITY.—Monier Williams thus writes on this subject in a recent number of the *Contemporary Review*. Ascetics, both wholly naked and partially clothed, are as common under the Brahminical system as among Jainas and Buddhists. The god Siva himself is represented as a dig-ambara or naked ascetic, whenever he assumes the character of a mahayogi, that is to say, whenever he enters on a long course of austerity, with an absolutely nude body covered only with a thick coating of dust and ashes, sitting motionless and wrapped in meditation for thousands of years, that he may teach men by his own example the power attainable through self-mortification and abstract contemplation. It is true that absolute nudity in public is now prohibited by law; but the dig-ambara Jainas, who take their meals in strict seclusion, are said to remove their clothes in the act of eating. Even in the most crowded thoroughfares the requirements of legal decency are easily satisfied. Any one who travels in India must accustom himself to the sight of plenty of unblushing, self-asserting human flesh. Thousands content themselves with the minimum of clothing represented by a narrow strip of cloth three or four inches wide twisted round their loins. Nor ought it to excite any feeling of prudish disgust to find poor, hard-working laborers tilling the ground with a greater area of sun-tanned skin courting the cooling action of air and wind on the burning plains of Asia than would be considered decorous in Europe. As to mendicant devotees they may still occasionally be seen at great religious gatherings absolutely innocent of even a rag. Nevertheless, they are careful to avoid magisterial penalties. In a secluded part of the city of Patna I came suddenly on an old female ascetic, who usually sits quite naked in a large barrel, which constitutes her only abode. When I passed her, in company with the collector and magistrate of the district, she rapidly drew a dirty sheet around her body."

MARVELOUS INTELLIGENCE IN A BRUTE INSTANCED.—A striking case of brute intelligence occurred not long ago near Nairne Township, in South Australia, and is related in an Australian paper. A very large bullock injured his eye with the hook of a chain, and it soon became so inflamed that it was thought best to cast him for the purpose of dressing the wound. It was found, however, impossible to do this, and as a last resource his head was put into the "bail," a contrivance for securing animals between two upright boards, one of which is movable. Having thus secured him, the men dressed the eye with bluestone. Then they unfastened the bullock, and immediately rushed from the stock-yard, thinking he would be infuriated with pain, and expecting to be attacked. Instead of this the poor sufferer walked off to the shade of a large tree, and on the following morning, much to the astonishment of its owner and all who witnessed it, the bullock walked up to the stock-yard of its own accord and placed his head in the bail, to have the eye dressed; and this he repeated every day until the eye was quite restored.

"SCUP" FOR "SWING."—The old Dutch word *schop* is given in Sewel's "Dutch and English Dictionary" as the word for swing. It is still used among the descendants of the Hollanders in New York in the corrupted form "scup."

PROBABLE ORIGIN OF THE WORDS CHEAP, CHOP, SWOP.—A chapman, in early English, was a merchant or salesman, that is, a vender of goods. Not, indeed, a merchant in the modern sense, as understood in the city, but a peddler or itinerant dealer, who walked about the country districts with his pack on his back. From the Anglo-Saxon word *ceapian*, to buy, we get a whole host of interesting phrases. "Cheap, an abbreviation of good cheap," says Mr. Isaac Taylor, "answers to the French 'bon marche.' Cheapside and Eastcheap were the old market-places of London." The original sense of the word is that of bargaining—the ancient method of making a purchase—which is preserved in the word to *chaffer*. To *chop* horses is to sell them. To chop and change is to sell and barter. To *swop* and to *swab* are probably phonetic variations of to chop. So, too, a cheap jack is not, as most people fancy, a man who sells things cheap, but a jack-merchant, that is to say, a common sort of peddler, the name jack being used as often elsewhere in a contemptuous sense. One more, the word chipping, prefixed to the towns of Chipping Norton, Chipping Camden, Chipping Sodbury, Chipping Barnet, and many others, denotes that they were anciently places of commercial importance, and may be compared with the modern cases of Newmarket, or Market Harborough.

WHO WAS SHE?—A telegram from Alexandria announces that "the second Cleopatra's needle has been lowered, and preparations are being made for its shipment to America." It seems a little rough on the Yankees to speak of the transportation of this obelisk as "lowering" it; but who, in the name of all that is ancient, was the "second Cleopatra?"

ECCENTRIC BURIAL.—Mr. I. Underwood, who died in 1733, left six thousand pounds to his sister on condition of being buried in the following manner: At the grave side six gentlemen, who were appointed to follow him, sang the last stanza of the twentieth ode of the Second Book of Horace. No bell was tolled, nor black worn; no one was invited but these six gentlemen, and no relation followed the corpse. The coffin was painted green, and the deceased was buried with his clothes on. With him were buried three copies of Horace, Bentley's "Milton," and a Greek Testament. After supper they sang the thirty-first ode of the First Book of Horace—all being in strict accordance with the will.

LITERATURE.

IN noticing the new volume of songs set to music,* lately issued by the Harpers, we might hesitate whether it belongs more fittingly to the department of Literature or Art, or if to the latter, to what special department of art to assign it, as it presents strong claim to a variety. Its literary character consists of a decidedly well chosen collection of forty-five songs, from Tennyson, which would of themselves make a sumptuous volume; but here their dress and accompaniments are such as befit their character, for they have been set to music by some of the chief living composers, who seem to have vied in their efforts to do their very best. Of the character of the music we presume to speak only modestly, and yet we venture the opinion that it is of a very high order. Besides two or three large portraits, there are ten full-page illustrations, exquisite specimens in both design and execution. Each song is first printed in full on a separate page, and then interlined with the music. The materials and the mechanical execution of the book are in harmony with its matter, and the whole constitutes a *répertoire* of artistic work, that will adorn any lady's boudoir. The English edition was, with manifest propriety, dedicated "by permission" to the queen—with us it is informally but really dedicated to the sovereigns of our parlors and households.

*SONGS FROM THE PUBLISHED WRITINGS OF ALFRED TENNYSON—with musical accompaniments, by Arthur Sullivan, Charles Gounod, Franz Liszt, Otto Goldschmidt, Sir Herbert Oakley, Sir J. Benedict, Joseph Joachim, Jacques Blumenthal, C. Villiers Sanford, etc. Edited by W. G. Cusins, with a portrait and original illustrations, by Winslow Homer, C. S. Reinhart, A. Fredericks, and Jessie Curtis. Cloth. Illuminated. Gilt edges. Illustrated. New York: Harper & Brothers. Royal octavo. $5.00.

Of "English Men of Letters" no more definitely characteristic name could be given than Robert Southey, who is the subject of the thirteenth number of Mr. John Morley's series of condensed biographies,* for Mr. Southey was eminently such and nothing else. With him the pen was what the sword was to the *corsair*. By it he ate his bread, and built his house, and provided for himself and his household the things needful; and by it he gained renown, and won a high place among men, and came to be recognized even by royalty, for whatever he was, or did, or attained to came to him by his devotion to literature. At five-and-twenty he was a recognized *litterateur*, and he was nothing else at forty, or fifty, or sixty. Unlike many others he can not be described as the author of this or that work—not because none of his works were of first-class merit, but because they were too many, and too uniformly good. Professor Dowden's sketch is rather an appreciative sketch of the man and his surroundings, and especially of his Cumberland home, than either a biography or a critique. It is altogether pleasant reading.

As we decidedly favor lay preaching, provided it shall bring an improved article of pulpit instruction, so we like to meet with a good religious book by a nominally secular author. Now just such a one we have in Mr. Thomas Hughes's (of "Tom Brown of Rugby" fame) "Manliness of Christ."† The title of the book is misleading, for in order to make his leading term apply to the Man of Nazareth, he was compelled to force into it a meaning somewhat different from that usually understood by it. The whole tone and spirit of the book is excellent, and while the whole human character of Christ is presented for attention, there is also a manifest purpose to vindicate his character from the charge of weakness and effeminacy, which is sometimes brought against it. Most of the substance of the book appeared some time since in consecutive numbers of *Good Words*. It is quite worthy of being reissued in its more permanent form.

*SOUTHEY: By Edward Dowden. New York: Harper & Brothers. 12mo. Pp. 197.

†THE MANLINESS OF CHRIST. By Thomas Hughes, Q. C. Author of "Tom Brown's School Days," etc. Boston: Houghton, Osgood & Company. 12mo. Pp. 160.

THE National Temperance Society has just issued a volume (12mo. Pp. 329) by President Samson, of Washington, elaborately discussing the question of the wines of the Bible, arguing strongly in favor of the two kinds theory, and showing that only non-intoxicating wines were used in religious services. The argument seems to be exhaustive. The book will no doubt be an authority.

The same house send us "The Curse and the Cup," an externally beautiful little 24mo volume of ninety-six pages, made up of a most touching story of ruin wrought by the cup, in which, as is often the case, the innocent was made to suffer with the guilty, the whole emphasizing its moral, *touch not*, and also illustrating the abounding iniquity of the liquor traffic.

THE Greek poets form a theme of perpetual interest among scholars and amateur critics, and of these Homer, as the chief, quite naturally attracts most attention. Sometimes we are told that he was a myth—a name around which the heroic ballads of old Greece were gathered. And again there were several Homers. Some say the "Iliad" was Homeric, but not the "Odyssey;" but others, like Gladstone and Schliemann, stick to the old idea of "the blind old man of Scio's rocky isle," and we incline to favor that notion. A learned and able lecture on the subject comes to us in a neat little volume,* made up of a lecture delivered some twenty years ago in Vienna.

THE literature of spiritualism, including both sides, is already large and steadily growing. Rev. Mr. Mitchell, of Brooklyn, has written still another book† on the subject,—a little on both sides, but containing a good many valuable facts and suggestions, though probably the whole subject will continue to be, as it has been, an unresolved maze of undeniable, but also unexplainable, facts, even after being rid of a vast amount of falsehoods.

KING JOHN is the subject of Mr. Rolfe's latest issued "Study of Shakespeare's Plays."

*THE ORIGIN OF THE HOMERIC POEMS, a lecture, by Dr. Herman Bonitz. Translated from the fourth London edition by Lewis R. Packard. New York: Harper & Brothers. 16mo. Pp. 119.

†KEY TO GHOSTISM: Science and Art Unlock Mysteries. By Rev. Thomas Mitchell. New York: S. R. Wells & Co.. Cincinnati: Robert Clarke & Co. 12mo. Pp. 249. $1.50.

It is, as is well known a strictly historical play, and yet in the hands of the great dramatist the subject is invested with a life-like realism and with a good share of dramatic power. The same characteristics that have been noted in other numbers of this series are also found here. The Introduction interprets the whole play, while the appended notes elucidate the text and remove some of its obscurities. We may say again what may have been said in noticing other numbers of the series, that for the *study* of Shakespeare we know nothing better.

Dr. George Dana Boardman, who will be remembered as the author of "Studies in the Creative Week," and of "Studies in the Model Prayer," has added to these contributions to devotional literature still another, *Epiphanies of the Risen Lord*, a series of meditations on Christ's several appearances after his resurrection with their lessons, especially for spiritual uses. He is a strong believer in the material nature of the future life, and expects the reappearance of the risen and ascended Christ in material and sensible forms. The amount of arguments employed to assert and defend this view somewhat distracts from the religious and spiritual force of the book, which, indeed, is its chief excellence. New York: D. Appleton & Co. Cincinnati: Robert Clarke & Co. 12mo. Pp. 289.

Books of explorations and adventures are always acceptable, especially to boys, and when they embody reliable information respecting geography and natural history they are doubly valuable. Such a one will be found in Mr. John Mortimer Murphy's *Sporting Adventures in the far West*. It professes to be largely made up of personal adventures and observations, made during a seven years' residence among the least frequented regions of the national domains, where he united the characters of a sportsman and a naturalist, in both of which he seems to have excelled. The work is especially valuable for its accounts of native wild animals in their primeval condition, as they are still found in the Rocky Mountains and the forests of the North-west. The book is a handsome duodecimo of 409 pages, well printed and illustrated. New York: Harper & Brothers.

Dr. Hurst's excellent address delivered in German before the Evangelical Alliance in Basle, Switzerland, September 6, 1879, appears translated, revised and enlarged. It makes a pamphlet of 35 pages.

EX CATHEDRA.

PROFESSIONAL ETHICS.

In the learned professions there are duly recognized laws for the regulation of the duties of their members to each other, those whom they serve, and to the general public; and beyond these there should be a due regard to the relations of these professions to essential morality. Professional morals are no doubt often technical and conventional, though probably generally wholesome, and conformed to the demands of right and duty. The physician must do his best for his patient, but he must carefully avoid any interference with one of a brother practitioner, even though through unskillful practice the man were likely to lose his life. Professional ethics are, indeed, admirable, if correct, but quite possibly etiquette may become more authoritative than ordinary rights and duties. So the legal profession has its rules of ethics and of etiquette, which indicate what must be done and what not done, what relations gentlemen of the bar sustain to each other, to their clients, and to the courts in which they practice, all of which are well ascertained; and because the parties in interest are usually in a condition to enforce their claims, these rules are pretty well observed.

But beyond these technical affairs there is certainly a duty owed to the public by these professional gentlemen which it is quite possible for them to overlook. For several months, not long ago, our attention was called to certain methods resorted to by counsel in a criminal proceeding which seemed to require examination. How far it is right and allowable for a defendant's counsel in a criminal case to make use of technical advantages, so as to compel acquittals while guilt is morally certain,

perhaps, can not be closely defined; and yet one who would willingly resort to such methods would come to be reckoned smart rather than able, and unscrupulous rather than conscientious. In cases of defense, especially in capital trials, the greatness of the prisoner's interest in the issue has often seemed to justify the use of even extreme methods, the morality of which, however, is often at least questionable. But the prosecution is shut up within still narrower limits, for certainly the capital punishment of one innocent person were more to be deprecated than the escape of many more guilty ones. No greater evil could be inflicted on the public faith than that the administration of severe penalties should be attended with reasonable doubts of their justice. The public safety, even against the highest crimes, is largely dependent upon the due protection of the innocent, and the irreversible punishment of one unoffending citizen would do more to impair the force of law, and to strip its penalties of their proper moral influences, than the impunity of many real and flagrant offenders.

A case, recently terminated in an Eastern city, illustrates, in a very forcible manner, the injustice and cruelty toward the individual, and the great peril to the whole administration of criminal law, arising out of an overzealous prosecution of one suspected of a capital crime. A woman was found dead, who had probably been murdered. A person residing in the vicinity was suspected of the crime, on purely circumstantial and indirect evidence; but after hearing the case, the local magistrate dismissed it, as not sufficiently proved to justify him in holding his prisoner for further examination. Subsequently the grand jury, on *ex parte* testimony, found a true bill of indictment against the suspected person, when, of course, he was committed to jail, without bail. But for more than a year the prosecution were not ready to proceed with the trial, leaving the accused all that time a close prisoner. At length the issue was joined, when it appeared that while the prisoner lay in jail the funds of the State had been used without stint, and the specialists of a great university had been actively engaged in working up evidence, out of which to weave a web of circumstantial proofs around the accused, from which it might be impossible to extricate him. The sciences of crystallography and microscopy were called into requisition, at a very large outlay of time, and learned labor, and money, including a visit to Europe, and all at the public expense. An array of counsel for the prosecution rarely equaled in any criminal case appeared, and all apparently animated with unusual zeal, to make sure a conviction by the most strenuous efforts.

To our view of the case at a little distance, and in cool blood, the affair seemed not only to outrage common justice, but also and especially to transgress the laws of *professional ethics*. It was, indeed, a lamentable spectacle to witness, through the successive months of the trial with what persistent ingenuity and force the prosecution pursued its schemes, adding thread after thread to the tissue of circumstances, in which it seemed to be hoped to entangle the man, and so to prepossess the minds of the jury that a verdict of guilty would be inevitable. The wonder is that it was possible to break through a web so well woven at every point, and with almost absolute certainty to prove the negative of the prosecution's theory. In many cases of complete innocence, with such a course of ingenious prosecution, inspired by professional pride, and with an unstinted amount of time and money at its disposal, conviction would be almost certain to occur. To our seeming the whole affair was one of flagrant professional abuse, and one which the public safety requires should be emphatically rebuked.

And this exceptionable feeling and proceeding appears also to have been shared by the presiding judge, and by at least one of the jurors. The rulings of the court, in nearly every contested case was against the defense, and when certain testimony was allowed only to prove an incidental point, it was permitted to go to the jury in its fullest availability, against the prisoner. In his final charge to the jury it was agreed on all hands, that the judge made the most damaging of all the pleas against the prisoner, recounting with great emphasis the points in the testimony on which a conviction might be founded, and also giving his own opinion of their sufficiency. So the matter appeared to us, in our careful study of the proceedings as they were reported from day to day. To us the court is only a name, and the affair one of history, of whose per-

sons, and special conditions, we have no personal knowledge; and so viewed, it seems to be a strange and a dangerous proceeding, violating most conspicuously the just laws of criminal and judicial administration.

The jury at last failed to agree on a verdict, as one of the twelve refused wholly to acquit the prisoner of all criminality in the case, notwithstanding the certainty that he was either altogether guilty, or not so at all.

A question here arises respecting a juror's duty in such a case. Had the case been reversed, with eleven for conviction and one for acquittal, we could sympathize with the man who would stubbornly refuse to doom a fellow-being to death, of whose guilt he was not satisfied; but to demand punishment on the single judgment of one against eleven marks a mixture of the characters of the hyena and the donkey.

A CHAPTER OF SUGGESTIONS.

WE receive not a very few letters giving their writers' views respecting our magazine, and how it ought to be conducted, and how it may become a "grand success." We are pleased with all such indications of interest in the subject, which, in fact, are all the more acceptable because of the rarity of any thing of the kind coming from those upon whom the responsibility of ordering these things rests. But the writer of the annexed letter goes into the subject with a zeal, and a breadth of views, that show him to have thoroughly considered it, and his words challenge earnest and respectful attention and intelligent consideration. We, therefore, give it to our readers, just as he wrote it for our individual reading, but without the writer's name, that it may be thought of simply in respect to what it says and suggests:

DEAR DR. CURRY,—About ten years ago I wrote and you published [in the *Christian Advocate*] my scheme for Methodist periodical literature. Among the suggestions of that paper was this, that it must grow, not be *made* arbitrarily—that it would come in answer to *the logic of events*, not be planned in detail and at once. (1)

Your editorial in the December REPOSITORY induces me to write you privately somewhat reviewing my plan, not that you can bring it about of your own free will, but if it strikes you favorably or unfavorably, you can talk it over. It must come. Possibly the time is not yet; but blessed are they that can labor and wait. We want one *mammoth weekly*, got out somewhat in the style of the *Advocate*, perhaps, eight pages larger, one-half of which [addition] may be advertisements, furnished at the lowest price that will pay expenses. It should be made up largely of just about such articles as have appeared in the REPOSITORY these three years, editorials and all; but with very little ecclesiastical discussion, and that only of the highest type. It should sustain to Methodism about the relation that *Harper's Weekly* does to republicanism, and should aim at only a summary of Methodist news, so that it would be as readable a month after its publication as on the day of publication. This might be called *The Advocate*, and it should be so truly *national* as to render a New York *Advocate* a necessity for its local Methodism. It should be offered so cheap that competition would be impossible, inviting and receiving a large patronage from every branch of Methodism, compelling it by its own intrinsic worth, and then by the logic of necessity and without any legislation on the subject, compelling all the other Church papers to become local, and to exist only for local purposes. And these local papers, except on missionary grounds, should be divorced from the funds of the Book Concern, as the Pittsburg and probably some others are, and then let them multiply just as much as the demand would require. (2)

As to the REPOSITORY, you will remember that I wrote you as soon as you were elected, not to accept the editorship. I knew that, in that case at least, the *resurrection* was past. No man can make a Methodist literary magazine a success, any more than the Asbury life men could make a Methodist life insurance company a success. A little extra labor may give it a momentary "boost," but it must sooner or later take its place among magazines on its merits just as other magazines do, and while its Methodist imprint and semi-official character will attract very few Methodist readers of that style of literature, it will repel very many who are not Methodists who might buy a magazine of its general character on the general market. And our Concern is not for the purpose of general literature.

The Advocate, par excellence, should be *sui generis*. The nearest paper, to my idea, now published is the *Independent*. It is bought at news-stands. So our *Advocates* should be on sale at news depots and on the cars. It should be at once sufficiently weighty to gratify the literary tastes of the most educated, and so light as to be readable in the families of those whom we are educating up in mind as well as in morals, and this it can be with very slight modifications of its present size and form.

The NATIONAL will not die wholly for another year at least. It took a "boost" the first year on trial, from a general hope, if not a confident expectation that you would work a literary miracle and make something out of nothing, or rather that you could make it ignore the laws of trade. (3)

Now just what action the General Conference should take, I can not suggest. Probably no action further than to order that from and after the first day of January, 1881, no periodical shall be continued by the Concern that does not pay expenses, that the Missionary Board may make appropriations to papers in mission fields; then let the details of changing the general character of the *Advocate* be left to the Book Committee. If the REPOSITORY can be made to pay expenses, keep it alive; but give us one *mammoth Advocate*, general in its character, and let it be THE ADVOCATE. If I could be the General Conference I could select the editor; but I am not likely to be. We could thus make a very high order of periodical literature, so popular, that a hundred thousand might be circulated weekly. But don't *you* continue in the REPOSITORY! G. A. T.

REMARKS.

1. This notion of writing upon the "logic of events" may be well or ill, according to the spirit in which the writing is done. There are times to wait, and times to work, to stand still and to go forward. To our thinking our Church administration is conducted a little too much on this rule of waiting. We run on, and on, in the same smoothly worn grooves, long after it had become manifest that new adaptations were very much needed, and this is especially true respecting our publishing affairs, and most especially so, respecting our periodicals. It has seemed to be the case that any periodical once started must be continued *in perpetuo*, at whatever pecuniary cost, and though its lack of circulation demonstrates its uselessness. There are changes all the time going on, in both literature, and in the processes of publishing and selling books and periodicals, but we are still going on in the mill-horse track marked out by Ezekiel Cooper and George Lane. The "logic of events" teaches nothing to those who will not read the signs of the times, and with whom the perfection of conservatism is to trend perpetually in the same tracks without regard to the changed conditions of things, and the necessities growing out of these.

2. Of the practicability and the desirableness of some such arrangements as here indicated we have no question. That such a paper could be made and sold at a less price than our present *Advocates*, and yet be much more profitable, pecuniarily, than are any of them now, we have no doubt at all; and in that way an abundant supply of the very best kind of reading matter could be carried into our families all over the land. We have long been satisfied that it is unwise, every way, for the Book Concern to support local newspapers all over the country. It interferes with the freedom of the press; it makes no sufficient demand upon local enterprise; it is at once, more expensive and less effective than would be a Methodist free press, managed and sustained by those of the localities to be served. These views we have published long ago, but our suggestions have not been received with favor, and so we have ceased to urge the matter. But it must not be forgotten that the success of the proposed general *Advocate* would depend very largely upon its editorial management; and with an *official* press that can not be *assured* before trial.

3. The NATIONAL has never been placed upon the basis that was indicated by its editor, when speaking of it in the last General Conference, and as was contemplated by him when the arrangements were made for the new form of the magazine. Being overruled after the work was begun, as to the approved methods of conducting it, he has done what he could, hoping against hope, and laboring with wholly inadequate facilities to accomplish all that has been possible, and now, without blaming any one, he is free to say, that the failure to achieve the hoped for success is not a surprise. Much more money, and a much broader policy, we have looked upon from the first and all along as essential to success in the preparation and publication of a first-class monthly magazine; and if "the powers that be" are not prepared to adopt such a policy, then failure is inevitable, and discontinuance of the effort the only wise course.

Surely it is high time that our publishing interests should be taken in hand, intelligently and vigorously, and cut loose from the worn-out past should be readjusted to the demands of the times. "But who is equal to these things?"

THE HOLMES FESTIVAL.

DR. OLIVER WENDELL HOLMES, poet, essayist, and humorist, "autocrat of the breakfast-table," with any number of further *aliases* and *et ceteras*, has completed the cycle of years which the Psalmist names and common consent accepts as the rounded complement of a life-time. But whether by reason of an improved hygiene or through better habits of living, not a few of the men of our times refuse to die, or even to take themselves out of the way, at seventy; and so Dr. Holmes, the septuagenarian, is still a positive factor among the activities of the day. But as the piquant doctor has long been recognized as a prominent member of the illustrious Mutual Admiration Society of Boston, his own favorite "hub of the universe," his coming of age could not, without a most indecent impropriety, be allowed to come and go unnoticed. The event was accordingly made the occasion of a specially "brilliant" congratulatory festival—the great feature of which quite above the display of the distinguished company of learned men and "charming" women, to say nothing about the wit and wine, was the "birthday ode" of the fêted poet, written in review of his own career and experience during his long and eventful life.

That this production would be more than clever would be expected by all who knew the man through his writings, and now that it is published to the world it will be gladly accepted as proof that, as to the inner man at least, "his eye is not dim, nor his natural force abated." Though a little shaded by the approach of life's gloaming, it is vigorous and cheery, showing the bright side of things—quite the opposite of the standard old man of the Roman poet,

> Difficilis, querulus, laudator temporis acti
> Se puero, censor castigatorque minorum;

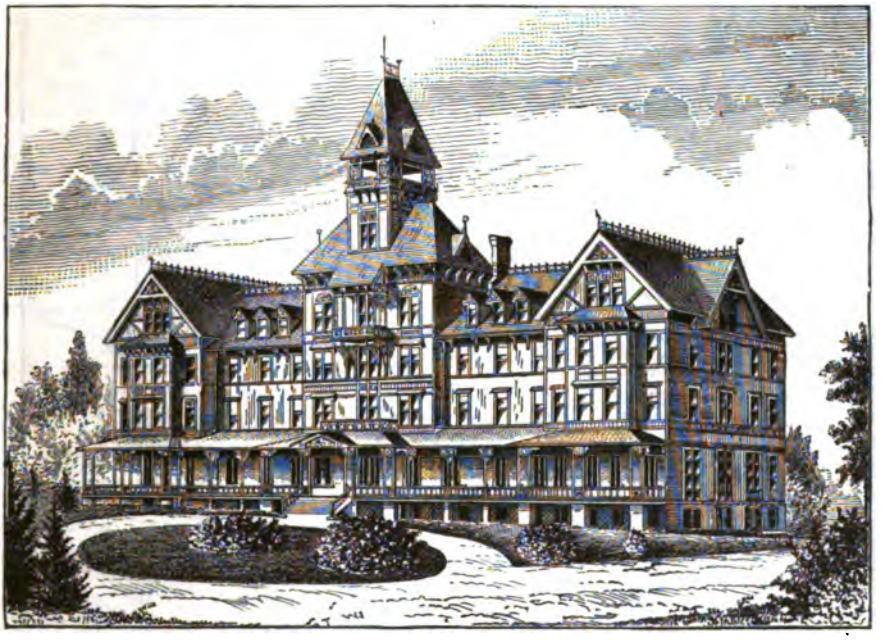
(which, being interpreted, may be read, "difficult, querulous, a praiser of past time, when he was a boy, the censor and castigator of his juniors.") And yet like the old man, pictured in Cole's celebrated allegory of the Voyage of Life, his face is turned to the past, and his thoughts refuse to go before him into that "great hereafter," which is so near at hand. The ode is certainly excellent of its kind, not chiefly, however, on account of its poetical qualities, but for its substance and the sentiments that it expresses. But its *kind* must not be disregarded in estimating its value. It is a pure, simple, and somewhat lofty, though really melancholy embodiment in song of genuine epicureanism, not that of the gross sensualist, the slave of animal appetites, but of the man of cultured tastes and rich imagination, and of philosophical self-control, exercised for the heightening of life's pleasures. All along it is assumed that this is a very good world, if only people will learn to pluck the fruits and leave the thorns, and avoid surfeiting, that the pleasures of partaking may continue. It seems to say that the only true wisdom consists in making the most of the world and of life as it is passing. True, this is not the philosophy of life taught in the New Testament, but it does not appear that the occasion for which it was prepared was of that kind. Dr. Holmes, no doubt, is a brilliant character, a fine writer, a poet, and a wit. But whatever he may be, and however admirable, it is very certain that he is not of the same denomination with St. Paul.

That breakfast and that ode have very naturally been made the theme of any amount of laudatory comments, and from almost all classes of people. The literary brilliance of its chief subject seems to have quite dazed the vision of some, who in other cases are Argus-eyed to detect the smallest aberrations from the faith of the fathers. The religious press of the country appears to have taken the key-note of the song and to be helping to swell the grand chorus, without the most remote reference to the fact that Dr. Holmes has won his chief renown by utterances that are distinctively and persistently hostile to Christianity. It is certainly a Christian virtue to forgive offenses committed against one's self; but that is rather a superabounding charity which fails to remember offenses committed and persisted in against one's best Friend. Nor should literary abilities be allowed to condone for persistent though verbally polite assaults against religion. As respects Christ and his religion, Dr. Holmes belongs to the category in which are found the names of Voltaire and Rousseau, Thomas Paine and Colonel Ingersoll.

NATIONAL REPOSITORY.

MAY, 1880.

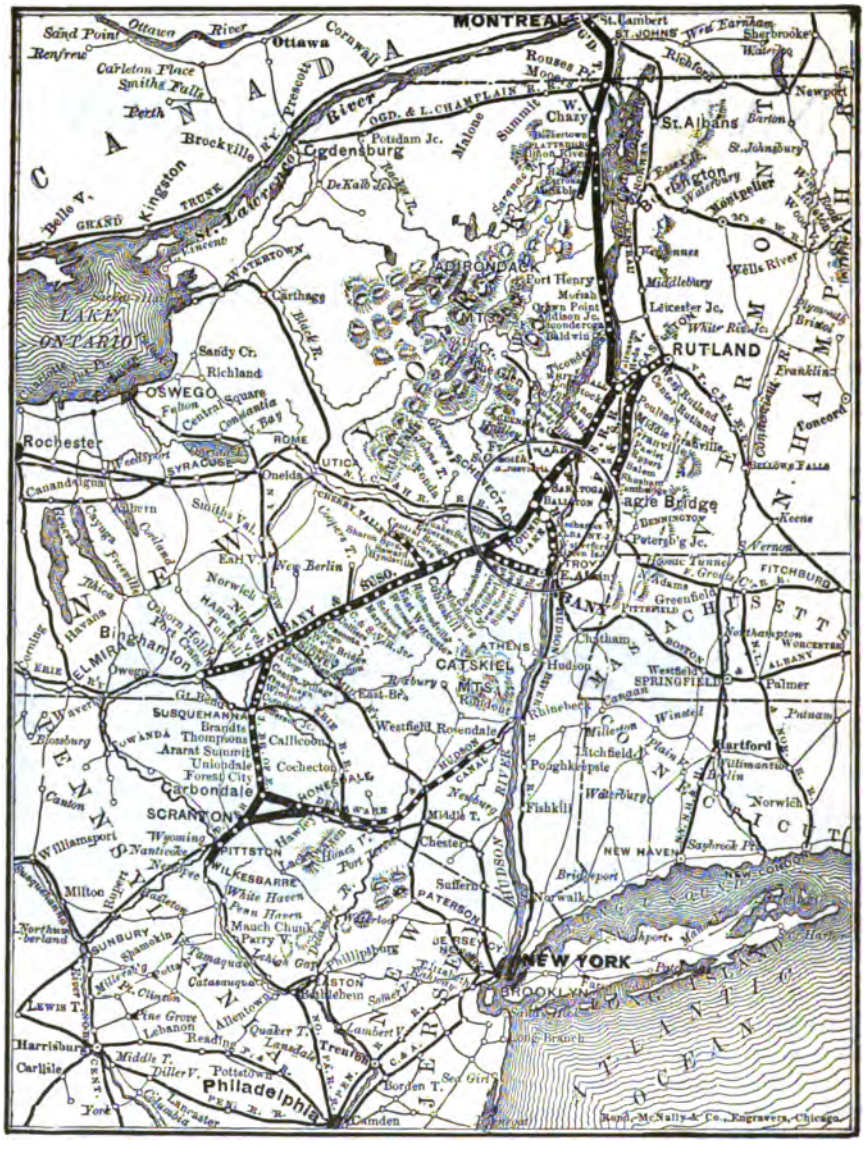
A SUMMER'S REST AT ROUND LAKE.



THE ROUND LAKE HOTEL.

WHERE shall we go this year? The Summer heats will soon be here, when it will be unfashionable if not unwholesome to remain in town. The seaside? The ocean is always sublime, but the air scarcely differs from that of our seaboard cities, and we need a change. The mountains? Their inexhaustible variety will never pall, but then we have "done" the White Mountains, explored the Catskills and encamped among the Adirondacks in years gone by; and, besides, solitude sometimes becomes oppressive. We need companionship and we want variety. Saratoga would supply the first. Too much of a good thing; besides, a great fashionable crowd is the loneliest sort of solitude, and, to say truth, we are heartily sick of "Summer resorts," with their smoking, drinking, and gambling. "The world, the flesh, and the devil," hold undisputed sway at the great watering-places, and we long for gentler rule. Have you ever tried a fashionable camp-meeting? Do n't shrink with denominational prejudice, but just try Round Lake. The very spot for novelty if nothing more, for complete separation from the unholy triad, for social companionship with the good, for busy idleness and complete rest; and so we decide to come to Round Lake.

Now for the preparations. What shall we take? That depends on how you are going



to live. The hotel contains every comfort, and a Summer wardrobe is all one will need there. But hotel life is no novelty. Why not, since we are to spend the Summer in camp, really camp out? That is all very well for ten days or a fortnight; but for weeks or months, perhaps, and for long storms, it will hardly do. Besides, the tents do n't mean to stay all Summer and we do. Suppose we hire one of the many furnished cottages which are always to let, and for the Summer time feel at home beneath our own vine and fig tree as symbolized by pine boards and a shingle roof. And now you know what to take, extra pillows and beds, for those of Round Lake do not tempt to unnecessary repose, fancy camp and garden chairs, toilet covers, pictures, and books (a few); in a word, such knickknacks as shall make our cottage as pretty and tasteful a little

baby-house as the others which nestle among the trees, or form the magic circle. And don't forget the umbrellas, waterproofs, and overshoes, for we are to take our meals at hotel or restaurant, and there will come to Round Lake days in which the Summer rain will come down as though the very skies had opened their flood-gates upon us, and there will be no arks to float us over the rushing torrents between the trees.

What route shall we take? That depends upon where we are going from. If from the great city whence all other good things as well as many bad ones proceed, the Hudson River day and night boats connect with the Saratoga trains, or a through ticket by the New York Central will carry us to the picturesque depot built on the very edge of the woods, and with one step, no staging, no tedious waiting, no vexatious changes, we are at our destination, our Summer rest. Of course, the Rensselaer and Saratoga Railroad brings visitors from the north and by cross-roads from the east and west, while for those who come in their own teams, as such multitudes do, a fee of twenty-five cents admits them to the new entrance at the end of Burlington Avenue, where are ample stables and sheds for their accommodation.

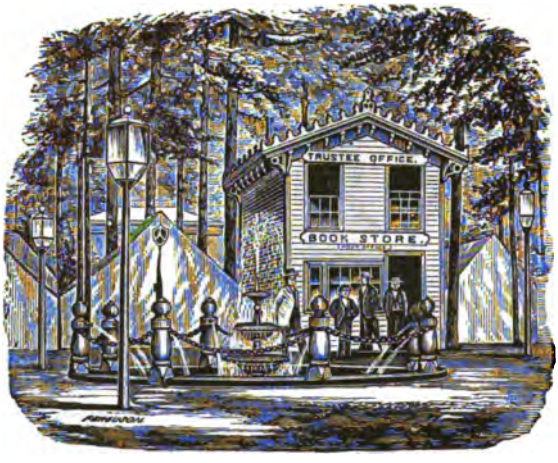
And now we stand upon the ground, let us take a first glimpse. To the left stands the hotel, covering what was a piece of waste land bordering a swamp, at our last visit, four years ago. It was built by the Association in 1878, at an expense of twenty-five thousand dollars, and is under the same management as that of the "boarding tents," or great dining hall, kept open only during the meetings, that of E. H. Armstrong & Co. It is a fair specimen of a Summer hotel, clean, sweet, and fresh, rooms comfortable and table excellent and remarkably well served, while we are surprised at the reasonableness of its terms, two dollars a day to transients and from eight dollars to twelve dollars a week for permanent boarders. It has about one hundred rooms, a broad, shady piazza, and is, of course, a temperance house. The tasteful manner in which the grounds surrounding it, vast as they are, are laid out is specially worthy of note, and the situation, near to the depot, yet removed from the camp-ground proper, serves to make it an exceedingly pleasant Summer retreat,

BOAT LANDING, ROUND LAKE.

even for families who are not especially in sympathy with the other objects of the Association.

But we are bound farther inland, so we turn up Fletcher Avenue, and walk between rows of cottages, vine-clad and ornamented with flower-beds, lamenting only their close proximity and the narrow avenue of separation, till we reach the center of the Forest City—Fountain Square. All of us may not be equally sensitive to beauty, but every one must remember the sensations which accompanied the first sight of this lovely spot. A pure, white basin it was when we first saw it, into which a central fountain and eight white jets are constantly pouring limpid water of a slightly emerald hue, suggestive, one would suppose, of innumerable sermons by the preachers on the water of life, the ever-flowing fountain, etc. In front of this, across a small park of tall trees, stands the dining-hall, and in front the trustees' office and the book-store, forming the two entrance pillars to the gateway, always closed during service, above which is painted in colored letters, "Enter into his gates with thanksgiving, and into his courts with praise."

But now we have to choose a dwelling, and multitudes of these little "shingle palaces," as Charles Dickens once christened our American architecture, pass in review before us. At length we are settled in our "own hired house;" our knickknacks have made the five rooms—parlor, dining-room, and kitchen on the ground-floor, with three tiny but airy bed-rooms above—quite homelike and habitable, and we sit on the piazza in front looking up at the moonlight between the trees with a sense of citizenship which will not be lessened when we retire to rest, with open doors and windows, if we so choose, since, under the guardianship of the nightly patrol of policemen, there is none to "molest us or make us afraid."



BOOK-STORE AND TRUSTEES OFFICE.

How do we spend our days in camp? With perfect freedom, you may be sure; formalities of dress and conventionalism have been left behind; there is pleasant companionship if one desires it, or complete solitude in shady nooks and upon rustic seats, if that is preferred; people gather in groups and chat, or wander about and think. There is not much work done, all have come here to rest. One day's occupations are much like those of another. Let us have a picture of a day at Round Lake. Whence came that dish which fills our center-table this early morning with pure beauty and fragrance? Ah! some one has been up earlier than we. Bessie has had a morning row across Round Lake, and passing through the channel only a few rods in length, has entered the little Crystal Lake, about one-eighth the size of its sister, and brought thence that group of lovely water-lilies. Every morning of the season shall we see them upon the table, and all Summer will youths and maidens be decorated with these emblems of purity. Let us pause to think how much of our enjoyment is to depend upon the lake formerly called Tanendahowa. Quiet rows at early morning, noon, or night are to be had in its many boats at the modest price of twenty cents an hour. The spot is a capital one for the practice of this most healthful occupation, smooth water, about one mile across in either direction, or three miles around, and the old boatman assures us there has never been an accident. Moreover there is a gay little steamboat ready to steam up for a party of eight or more, and a barge for excursions, which will contain a much larger number. And then if John

COTTAGE FOR PRESIDING OFFICERS OF THE MEETING.

JOSEPH HILLMAN, PRESIDENT.

has brought his fishing-rod he will find good sport here, for the lake is well stocked with native perch as well as the exotic bass, of which several thousands were imported five years ago, and fishing is allowed at all times. There is also a swimming-rink brought from Troy in 1879, and set up in the lake at an expense of two thousand dollars; but as yet it has not been very largely patronized. The lake is reached by a tunnel running under the high road which cuts the shore of the Round Lake grounds.

We are up too late for the lilies, but it is *en regle* to take a before-breakfast walk to the mineral spring, standing close to the hotel and covered by a graceful canopy, whether we are in need of its virtues or not. This spring has a history. As Round Lake stands in line with Saratoga and Ballston, it occurred to some wise heads among the trustees that in its precincts also might be found valuable and salubrious mineral waters. Geologists surveyed the land and decided that such might be struck at twelve hundred feet below the surface, and an appropriation of five thousand dollars was made with which to commence the boring. A religious service was held in 1875, when Bishop Janes and Mr. Hillman each took hold of the borer and gave the first turn, prayers and other brief exercises being participated in by the bishop and several other prominent speakers. Deeper and deeper went the borers, pure water and white sulphur water being successively reached, but still no mineral spring till at the twelve hundredth foot the five thousand dollars was exhausted, and the courage of the association began to flag. But after an offer from the president to take the whole off its hands, they finally concluded to risk another thousand dollars, and just before the fourteen hundredth foot of depth was reached the water followed the borer to the surface. Another service of jubilant thanksgiving was held as the water spouted bubbling and boiling up to the surface; the work was completed at an added expense of six thousand dollars, and it has since been decided to be

COTTAGE OF JOSEPH HILLMAN, PRESIDENT, 1880.

the most beneficial of the many springs in this region of country.*

*This water was analyzed by Dr. C. F. Chandler, and found to contain in each U. S. gallon, of 231 cubic inches: Chloride of sodium, 394.29 grains; chloride of potassium, 9.43; bromide of sodium, 1.47; iodide of sodium; 1.31; bicarbonate of lithia, 2.74; bicarbonate of soda, 48.98; bicarbonate of magnesia, 9 78; bicarbonate of lime, 13.44; bicarbonate of strontia, 1.20; bicarbonate of baryta, .55; bicarbonate of iron, .63; bicarbonate of manganese, .07; sulphate of potassa, 1.02; phosphate of soda, .02; alumina, .06; silica, 1.22; with traces of fluoride of sodium, biborate of soda, and organic matter. The density is 1, or a trifle over.

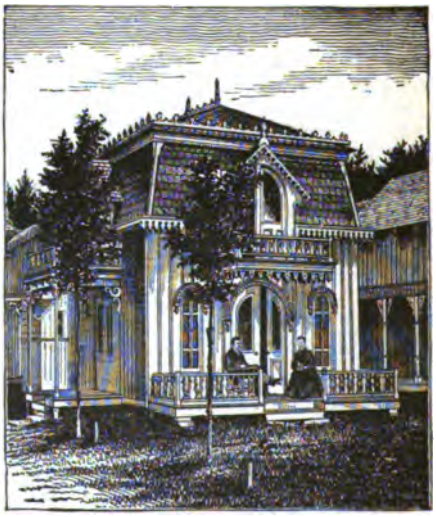
Breakfast over we will take a little drive to "view the land," its natural beauties, and well planned and executed "improvements." The circuit of the grounds is about one

COTTAGE OF J. D. RODGERS, SUPERINTENDENT.

mile, the area, two hundred acres, divided into over one thousand lots, of which about eight hundred have been sold and on which over two hundred cottages have been built. These cottages are generally planned with taste, and great pains is taken in the cultivation of door-yards, little flower-beds, creepers, and the like. They are interspersed with sunny lawns, parks of various shapes and sizes, sparkling fountains, and open squares. The association was formed in 1868, and for eleven years has, with few changes, continued to manage the enterprise with consummate skill. The rules of government are strict, and administered by an efficient police, in consequence of which a quieter, more orderly community in a neater, better kept town can not be found in the land. The grove of trees is the glory of Round Lake; many of them are nearly one hundred feet in height, and are found in great variety. Over thirty species have been noticed without reckoning the undergrowth. The very birds and squirrels twitter among the branches or skip along the ground, stopping now and then for a saucy look at their human companions, for, the use of fire-arms being interdicted, they are utterly devoid of fear, and rather enjoy the Summer season when they have so many visitors. The soil, a coarse, light gravel, renders the spot singularly free from malarial influences, the perfect cleanliness and good management prevent the usual evils of massing so large a body of people, and the elevation of the grove, sixty-five to eighty-five feet above the lake, gives the air a purity and freshness conducive to perfect health.

The stand, seats, double circle of tents, with their radiating avenues, and surrounded by Wesley Avenue, with its outer ring of cottages, as well as the dining-hall and the majority of buildings, are all within the grove, but just beyond the land suddenly falls off toward the lake, and here on the sunny slope and meadow are built many beautiful Summer homes. Nor must we forget the "cottage," or rather commodious home of Captain J. D. Rodgers, the superintendent, who lives here and keeps things straight "all the year round."

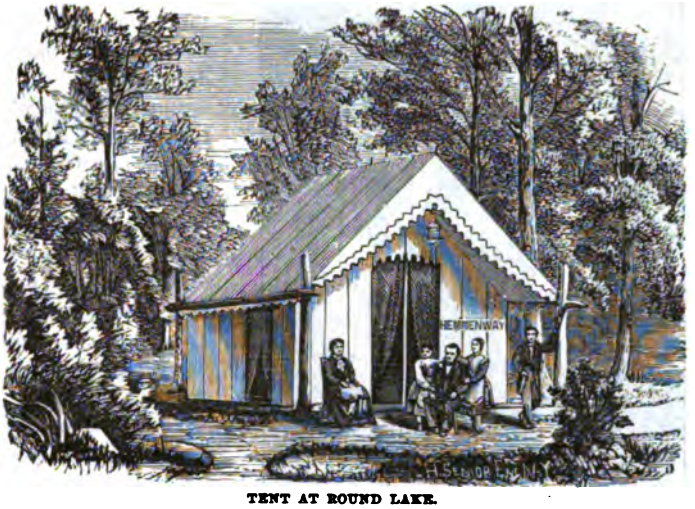
But is there not some monotony of occupation as the days go by? No, indeed!



COTTAGE OF REV. B. I. IVES, AUBURN.

This is a beautiful morning for "Palestine Park," a miniature representation of the Lord's Land. Clear sunshine, fleecy clouds mirrored in the smooth lake, and just enough

breeze to prevent the heat, from which there is no shelter, from being oppressive. The scale of the park, constructed in 1878 by Rev. W. W. Wythe, M. D., at an expense of twelve thousand dollars, is two and a half feet to a mile horizontal measure, and four hundred feet to one vertical. This scale is greater than that of Chautauqua, and the faults of that first attempt have been corrected by the architect of both. We notice this especially in the piles of cement and stone intended to represent the great mountains of Hermon and Lebanon, whose jagged edges as well as the winding paths by which they may be ascended, give a genuine impression of mountains on a small scale. The rivers, whose distinct banks of concrete confine the tiny streams and prevent the absorption of their waters, are fed by an ingenious system of underground pipes which run from a building wherein machinery is constantly at work pumping up water from the "Dead Sea," in which is a natural mineral spring strongly impregnated with iron. The entire size of the park is five hundred feet in length by two hundred and fifty in breadth. Such an object lesson can not but be of great value to the Sunday-school people who congregate at the Sunday-school Assemblies held here every Summer; and, indeed, we never feel the reality of sacred scenes and incidents so vividly as when studying Samson's exploits in full sight of Gaza, reading Jacob's vision at Bethel, looking up from the narrow valley in which lies Shechem, and listening to the curses and blessings from Gerizim and Ebal, rising abruptly on either side. Bethlehem, Cana, Capernaum, Nazareth—how vividly they call up pictures in the life of Jesus! while, as we look from the height of Carmel to the Bay of Acre, we have a sudden vision of the romance of the Middle Ages, the chivalry and the rivalries, the successes and failures, of the Crusades. Before leaving the inclosure we must look at



TENT AT ROUND LAKE.

the larger model of the Holy City on a scale of one foot to one hundred and fifty, where on a circular wooden scaffolding one may "go round about Jerusalem and tell the towers thereof."

Another morning we take the train to Ballston or Saratoga, and, spending the day among the noise and confusion of the butterfly throng, return in the cool and quiet evening to rejoice in our sacred rest; and if it be Monday, Wednesday, or Friday, attend the children's meeting, or the regular prayer-meetings, and feel that we have not, as is done in so many Summer wanderings, left our religion with our Winter life at home.

Yesterday we took a lovely drive through a smiling rather than a romantic country to the White Sulphur Springs, five miles off, on the shore of Saratoga Lake. This is the favorite drive from here, and as we often take it with our visiting friends we are familiar with the road and its points of interest, among which is an old Dutch stone mansion, built of cement, in which are embedded cobble-stones gathered by the first owner from his farm, and sifted that they might be of uniform size; also a church seventy-five years old, said to have originated

in a drunken frolic, two of the revelers when sober keeping the promises made when drunk, and giving the building to the village of Round Lake, with the sole condition that it

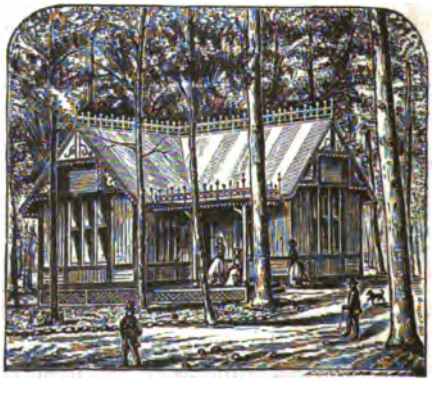
COTTAGE OF DR. BENJAMIN KING, N. Y.

should be occupied by Christians of all denominations, a condition still religiously adhered to.

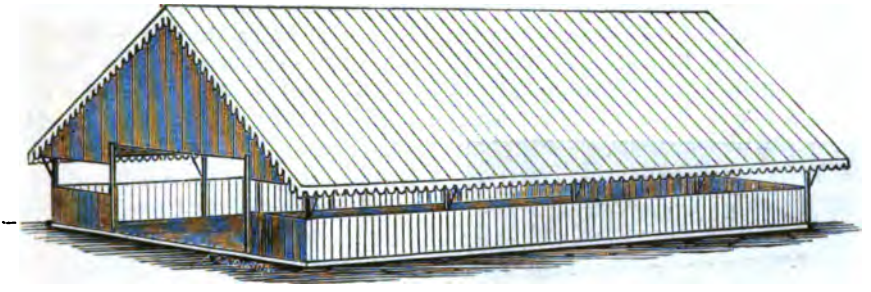
But our quiet mornings and sleepy afternoons are soon broken in upon by the busy preparations for the camp-meeting which is soon to begin. Come down to the depot and note the arrivals; it is still two days to the meeting, but those who mean to enjoy it always come early. What a heterogeneous mass of baggage! Chairs, beds, tubs, stoves, kitchen utensils, books, ornaments, pictures, and wearing apparel are grouped together in picturesque confusion; carts, loading and depositing their contents, tent-raising, bunk-erecting, and straw-bed making, the sound of the hammer from morning till night, mingled with the merry chatter of voices, the greeting of old friends, the laugh of happy children and the cry of tired ones—what a novel scene! You may be wearied and amused, but you will never be grieved by the sound of oaths or the utterance of angry words. What relishing dinners are eaten on barrel-heads, or *al fresco* on the ground, and what rueful faces appear at the discovery that the most necessary articles are those which have been left behind; what curious and ingenious contrivances are improvised to supply the want of shelves, drawers, and home conveniences! But all is settled at last and the little canvas home in the wilderness looks so home-like one can hardly realize that it is only to last for ten days.

But I am admonished that this rustic picture is rather a thing of the past in the early days of our Summer home. Now tenting is rather at a discount, the accommodation at cottages being so ample that the more primitive style of lodging is only needful in cases of an uncommon crowd, while the appliances of civilized life have so multiplied at Round Lake that one would almost as soon carry furniture or cooking utensils to Saratoga as here.

To the camp-meeting routine you will soon get accustomed, and you are at liberty to attend as many meetings or as few as you choose. The preaching is of every grade, and it will be hard if your tastes, spiritual or intellectual, are not gratified. To a student of human nature the gathered congregations give a never-failing occupation. Here come a farmer with his family and picnic basket, and there a group of exquisites from Saratoga, whose brilliancy of costume draws grave disapprobation from the few remaining primitive Methodists, in sad-colored dresses without ornament or superfluity. Great crowds come on some days, especially Sundays, when the gates are closed from ten till four; in consequence of



COTTAGE OF J. W OSBORN, ALBANY.



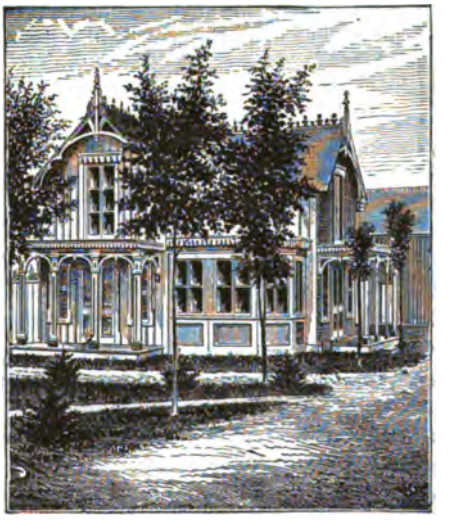
TABERNACLE FOR PRAYER-MEETINGS, ETC.

which, though there are often additional thousands present, perfect order and decorum are preserved throughout the day. The auditorium, with the stand decorated as it is on these festival occasions with hanging baskets, floral devices, and garlands of evergreen fronting the white seats, is packed with a dense mass of people. This, with the standing multitude often reaching to the very doors of the double concentric ring of white tents, constitutes a picture to be photographed and carried away for a life study.

The success of an enterprise must be judged by its results in the line of its legitimate purpose; and surely, in its spiritual aspect, that of Round Lake has been complete. Never has the social or recreative element been allowed to encroach upon the higher object to which a camp-ground is dedicated, and, in consequence, there is a feeling of quiet holiness pervading the place which we have never known elsewhere. To particularize the many meetings, Sunday-school assemblies, and temperance gatherings, which have from time during the past ten years been held here, would be foreign to the scope of this article. Perhaps the grandest and most far-reaching in its influence is the "National Camp-meeting for the Promotion of Holiness," held in 1878. The multitude which thronged the grounds during its session is almost beyond computation, over twenty thousand people having on several occasions been present at once.

But, perhaps, the meetings of most significant import were the two great fraternal meetings presided over by the sainted Bishop Janes in 1874 and 1875, which have done more than any other agency to heal the breach between the long divided Methodist Episcopal Church North and South, many of whose ministers and bishops learned anew under these trees the old lesson of "how sweet and pleasant a thing it is for brethren to dwell together in unity."

Another very interesting meeting was the Union Evangelistic Camp-meeting of 1877, in which all denominations took part, and a delightful spirit of unity and brotherhood prevailed. Since 1877 a grand Sunday-school assembly has been held here each year, that of 1878 being conducted by Dr. Vincent, with, of course, complete success.



COTTAGE OF A. BIRCH, AMSTERDAM.

Also, during the past two years, there have here been held important temperance meetings directed by Mr. Murphy and others.

To see Round Lake in its glory we must spend at least two Sundays here—one, when

the multitudes throng the forest sanctuary in meeting time, and the other when during our quiet country life only the citizens of the little village meet to worship God be-

COTTAGE OF HON. GEORGE WEST, BALLSTON.

neath the whispering trees. To wake with the six o'clock bell, and, while glancing at the early slant sunshine making broad patches of light upon the tree trunks, listen to the hymns of the early prayer-meeting as they swell up on the still morning air, is somewhat akin to awakening among the angels. And to sit through the morning testimony meeting, the morning service, at which some good preacher officiates all the season, to teach in the Sunday-school regularly superintended by Captain Rodgers, and to close the day with a praise meeting led by the far-famed Round Lake choir, always and ever with the accompaniments of quivering leaves, singing birds, and the indescribable hush which tells that nature knows it is Sunday, is to realize for one's self that "the groves were God's first temples," and that a camp-ground may be the very "gate of heaven."

But all good things must have an end. The season is drawing to a close. August evenings are chilly for out-door services, August nights cold for sleeping in tents or pine cottages with unplastered walls. September is near, and so is our flitting, but as our steps and thoughts turn homeward towards the conventionalities and duties of civilized city life we will imprint upon our memories one last enduring photograph of our Summer's rest at beautiful Round Lake.

RAPHAEL.

FIRST PAPER.

DOWN the road of iron from Bologna, the capital of the Romagna, that old Etruscan town at the base of the Apennines, which boasts the honor of an imperial residence and one of the world's oldest universities, where once ten thousand students sat at the feet of distinguished professors of the sterner and of the fairer sex too, the intelligent traveler, bound for Italy's free harbor of Ancona, so named on account of its position in an angle of the Adriatic coast, halts at the city of Pesaro. This is the old home of the dukes of Urbino, who made it one of the cradles of Italian art and literature. It is the Weimar of Italy. It is the birthplace, too, of the celebrated Rossini, whom the French delight to claim as one of their most illustrious composers because he dwelt most of his active life in Paris, but whom the Italians refused to surrender, and in self-protection surnamed "the Swan of Pesaro," that in after years the birthplace of the author of "Stabat Mater" might not be a matter of dispute between divers cities and countries.

The Valley of Foglia, in which Pesaro is situated, has, however, still greater attractions than are found where the land falls into the sea. Five hours back from the Adriatic in a south-easterly direction and pressing high up into the barrenness of the central Apennines, on a bold cliff, over the

THE SACRIFICE AT LYSTRA.

brawling Metaurus, where one commands a distant view of the blue sea, lies sequestered the old little university town of Urbino. In the fifteenth century it was "the Italian Athens," in the nineteenth century it is the Stratford of Italy. We are not drawn to Urbino because it bears the name of the illustrious house whose Frederigo di Montefettro, as first duke of Urbino (1410–1482), inspired the first stirrings of the Italian Renaissance, and for fourteen years kept twenty or thirty copyists at work transcribing Greek and Latin manuscripts, which now, bound in crimson velvet with silver clasps, enrich the Vatican library at Rome, or whose Giovanni della Rovere, nephew of Pope Sixtus IV, and last duke of Urbino (1548–1631), gave his almost exhaustless treasures for the completion, in its fullest fruition, of like glorious work, nor because the town contains much that recalls its pristine splendor. We jog along for five or six hours over an uneven hilly road in an Italian stage, to reach at last this ancient mountain town, because it is the birthplace of the prince of artists. We make our pilgrimage to the Stratford of the Shakespeare of painters.

In Strada del Monte, so called because it is situated on a steep hill-side up which the pack-mules clamber, cat-like, over rugged stone steps, we halt before an old rickety stone building, whose lower portion is used as a blacksmith shop. Over a little, narrow entrance, which admits to the hall-way and staircase of the house, we decipher the figures 276. This is the house in which the world's greatest painter, Raphael Santi, is supposed to have spent the earliest years of his life. Over the door of the shop an inscription, engraven on a stone tablet, informs the observing passer-by that this house was the dwelling-place of the family of Santi, when Raphael was born, on the 6th of April, 1483. Tradition is ever busy with the boyhood of great men, and often whispers more than it knows. So little is positively known about the first years of Raphael's life that we are skeptical about 276 Strada del Monte being his birthplace; but there is a great likelihood that it was once the dwelling place of the Santi family, and that it has some historical connection with the subject of our sketch. Let the fact that it is now reverently preserved and held as public property persuade us to abandon all our skepticism and foster the belief of the multitude.

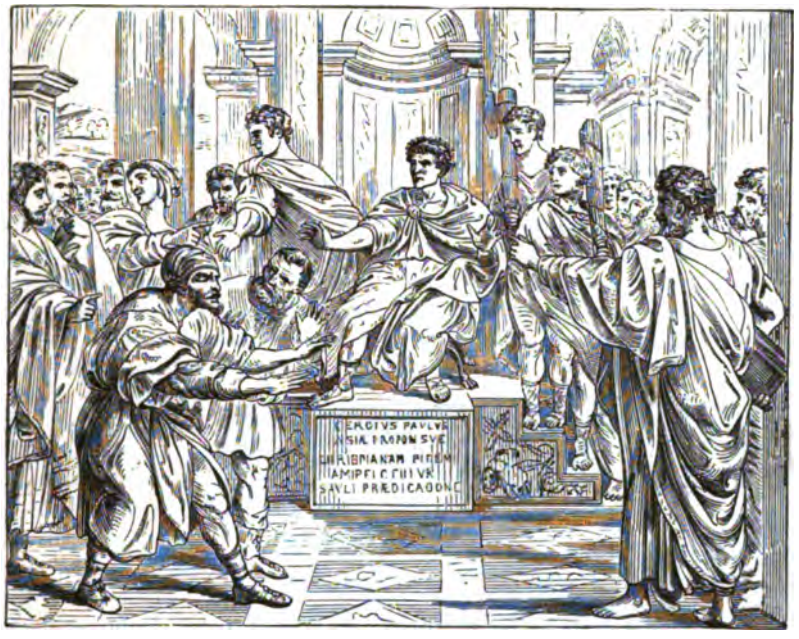
Raphael was born in one of the most favor-

able hours of modern history. He was swept into the domain of Italian art in the high tide of Europe's reawakening, in the full noonday splendor of the Italian Renaissance. There is no more memorable period as yet in the new history than that which closes the fifteenth century. Indeed, it must ever remain memorable in the annals of the human race. It marks the beginning of one of the great transitional eras of history. Its changes were in so many directions. There was first the ending of the feudal system and the re-establishment of organized government. Then there was the contest between Christian and Saracen, ending in the downfall of Constantinople and the general distribution of Hellenic art and culture among the different nations of Western Europe. And lastly, but most worthy of note, within this era is the start which invention and discovery took. A new life had come into the industries, sciences, and arts. "All was renewed," says Taine; "America and the Indies were added to the map of the world; the shape of the earth was ascertained, the system of the universe propounded, modern philology was inaugurated, the experimental sciences set on foot, art and literature shot forth like a harvest; . . . . there was no province of human intelligence and action which was not refreshed and fertilized by this universal effort." This was Europe's grand age and the most notable epoch of human progress.

To be sure the world had been moving onward ever since the opening of the Crusade wars. Possibly the era of our modern civilization should be dated away back to the reign of Charlemagne, when civil order was measurably restored in France, Italy, and Germany, and a profitable intellectual and commercial intercourse began to spring up between those countries on one side, and Spain and the Byzantine Empire on the other. But it was by contact with the Saracens that the European was first quickened with new life; to say nothing of all that the Christian brought back with him from the East, or that the Mohammedan brought along with him as he arrived on European shores.

From the East Europe got her windmills to grind her grain, her machinery to make paper, the art of distillation, perhaps, nitric and suphuric acids; a more manageable set of numerals, the science of Algebra, and that higher mathematical and astronomical knowledge, which subsequently procured the publication of annual almanacs, and the double entry in book-keeping, a superior skill in surgery, the art of making sugar from sugar-cane, the teachers for the schools of Cordova, which for several centuries continued the best in Europe. The more general use of soap and glass bottles was due to the same exciting influences, and so, too, the increase of the iron stock, and the encouragement of the fishing interests, and the multiplication of the implements employed in this trade. Without the Saracens Europe might never have known the magnetic needle, and Christopher Columbus and Vasco de Gama never brought to light new worlds. Gunpowder, too, though in many respects of questionable advantage to civilization, was one of the Chinese inventions brought by the Saracens to Europe. This plaything of Asiatics in fire-works the Western nations adopted as an important aid in warfare, and so gave the invention a very different purpose. Yet gunpowder helped also to work mines and stimulated the production of iron. Without the Saracens Europe might yet sit in darkened homes as it did for centuries after the discovery of glass in a monastery. Used in Pompeii in A. D. 79, its advantages seem to have been lost with that city, and though discovered by a monk in A. D. 653, it was not used in windows until 1177. Until about this time, too, houses never had had the convenience of a chimney or the advantages of even candle illumination, and from the same period dates the use of forks, though they were only slowly adopted and were still a novelty in England at the beginning of the seventeenth century.

It seems as though men suddenly opened their eyes and saw. In truth, they had attained unto a novel and superior kind of intelligence. The new century, the sixteenth, began so unlike the preceding one,

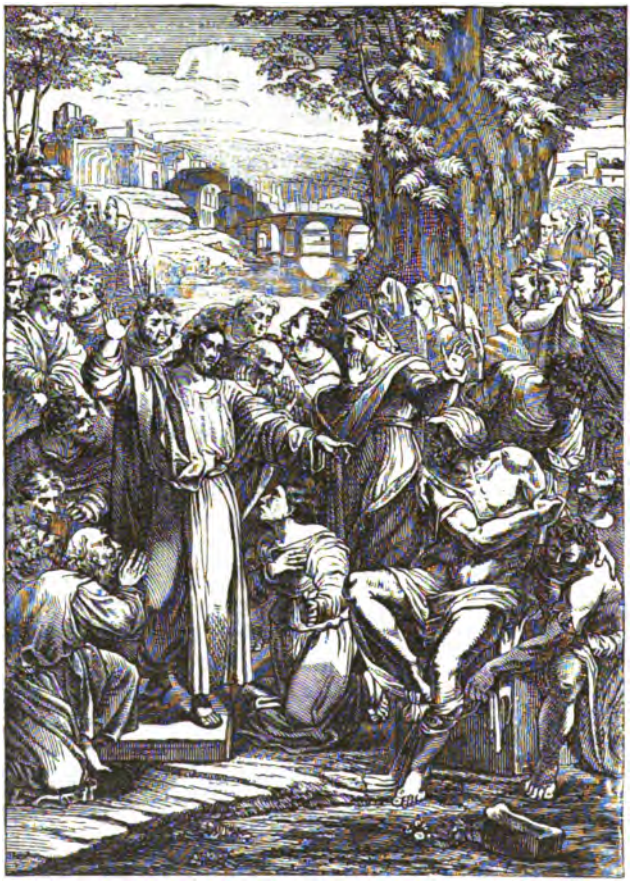


ELYMAS THE SORCERER STRUCK BLIND.

that a thousand years seem to lie between them like an unspanned gulf. But if the fifteenth had closed with a marvelous degree of activity and advancement, the strides of every year in the new age were working the complete transformation of Europe. Pocket-watches were invented, pins came into use, amalgam mirrors, too, and black lead or graphite pencils; machinery was employed for finishing cloth, spring-locks were devised for muskets, and in their day must have been a greater surprise than the needle-gun in ours; spinning-wheels, long used in India, were brought over to save ninety per cent of the labor in making thread; and, as men had learned to go on the water in all directions, the diving-bell now came to carry them safely to the bottom of the sea; zinc was discovered, the silk trade was established at Lyons, the first treatise on navigation was composed, the first coaches were made, and four-wheeled wagons for common transportation began to appear. Wooden bellows and the stocking-loom—previously hose were sewn together of cloth—were invented; the cauliflower, the potato, maize, timothy, and various other pasture grasses and tobacco, were introduced to European cultivation, and the turkey was added to the poultry-yard. At the same time Peruvian bark, ipecac, sarsaparilla, chocolate, vanilla, and cochineal were imported from Spanish America. Stamp-mills were invented to crush ores; the quicksilver mines of Huancavelica, in Peru, were opened, and the method of separating silver from its ores by amalgamation was discovered, and so a new impetus secured to the mining interests of the New World as it unfolded to European eyes.

The world was in a mighty flood of new ideas. Inventions, restorations, emancipations of thought and belief flowed in upon the human mind, and the accumulated obstructions of the Middle Ages were broken down by the irresistible force of a power greater than that of steam—the will of awakened man. The darkness of the ages was suddenly lighted up by a blazing luminary. The hour of midnight was spent; the morning dawn had given way before the resplendent glory of the noonday hour. The East and the West had met; Asia and Europe had kissed each other, and America re-echoed the shouts of brotherly love. The

world was become a common market-place. Was this all due to the contact of Saracen and Christian, of the red and the white man, the introduction of comforts, and the inventions of safeguards and facilities, or was there a greater cause yet than all these? The effects of the Crusade movement were beneficial, the discovery of new worlds a motor to enterprise and daring, the invention of gunpowder advantageous to society in many ways, and so the other discoveries and inventions, but they did not work the transformation. The fullness of this time came with the introduction of printing.



THE RAISING OF LAZARUS.

The greatest invention since the alphabet was that of movable wooden types, made in 1436 by John Gutenberg, of Mayence. The idea was original with him, though such types had been used for centuries in China; but the manner in which that language was written rendered the types much less valuable than those in Europe, where, almost immediately after their discovery they made a revolution in literature and education. Peter Schoeffer cast metallic type in 1452, and this was another great step forward. The cost of books was soon reduced ninety per cent or more. Now, indeed, a glorious future lay before the breaking sixteenth century. The seeds sown by the great minds of the fourteenth and fifteenth had been germinating and blossoming, unheeded save by the few; but now in this new age the blossom was to ripen into fruit, whose rich clusters would hang down within the reach of of many besides scholars. By the aid of Schoeffer's invention the new forms produced seven hundred and fifty-one books in the remaining years of the fifteenth century; and in the first decade of the sixteenth no less than eight hundred publications. A secure foundation had at last been laid for the new era of culture, and for its continuous development, with none of the interruptions which had been the misfortunes of the ancient civilization, and with no limit save those imposed by nature to avert the increase or the activity of mankind. "Printing," as has been well said, "is the art preservative of all arts," the chief foe of ignorance and superstition, the chief aid of civilization, and without exception the greatest invention in history.

This, the most efficient handmaid ever given to literature, had her home in Germany; yet it was in Italy that the best

printing establishments flourished. This is easily accounted for. At the beginning of the sixteenth century the richest literature in Europe was that of Italy. The Renaissance, as it is called, was not a mere servile reproduction of antiquity, it was the harmonious fusion of the elements of Christian civilization with the traditions of ancient taste and learning. Italy was the happy country in which these two streams blended their waters. During the Middle Ages, in the midst of prevailing darkness and disorder, Italy never wholly lost the traces of ancient civilization. "The night which descended upon her," says Macaulay, "was the night of an Arctic Summer. The dawn began to reappear before the last reflection of the preceding sunset had faded from the horizon." The three great writers—Dante, Petrarch, and Boccaccio—introduced a new era of culture. To the long neglect which the classic authors had suffered Dante refers, when he says of Virgil, that he

"Chi per lungo silenzio parea fioco."*

The mind of Italy more and more turned back upon its ancient history and literature. During several ages Italy had grown great by means of commerce and religion. The Crusades, which had impoverished the rest of Europe, had enriched her; and the subjugation of the nations to the court of Rome had made her the treasury of Europe. Material wealth permitted the encouragement of the study of literature, which relations of commerce or of conquest with the Greek empire had been the means of reviving. The study of the Roman classics became a passion. No pains and no expense were spared in recovering manuscripts and in collecting libraries of the remains of classical art. Princes became the personal cultivators and profuse patrons of learning and art. The dukes of Milan, the commonwealth of

ST. CECILIA.

Venice, the republic of Genoa, the democratic rulers of the Florentine house of the Medici, all vied in reviving the culture of old Greece and Rome. "In fact," says Taine, "at that time Italy clearly led in every thing, and civilization was to be drawn thence as from its spring."

This complete revolution of life and thought necessarily exerted a great, and in many respects favorable, influence upon the development of art. Indeed, if we wish to understand the Italian Renaissance, we must study the art growth in Italy in the fifteenth and sixteenth centuries. During the period,

*Seemed from long-continued silence hoarse.—*Inferno*, I, 63.

perhaps from about 1420 to 1520, that is, from the first dawn of the Renaissance to the death of Raphael—that golden age in Italian art—her masters raised or transformed the national schools with such originality and vigor that all art likely to survive is derived from hence, and the population of living figures with which they have covered our walls denotes, like Gothic architecture or French tragedy, a unique epoch in human intelligence.

The breath of a more deeply stirred mental life began to vivify the severe typical forms. Not only was a different style of art called out by a close study of the old classic worlds, but by the individuality of the times. There was a growth of individual conceptions and individual modes of treatment. The creations of art were no longer, as in the Middle Ages, symbols of the universal mode of thought prescribed by the Church, productions called out by the views of the Church. Works of art were now

MARY AND THE INFANT JESUS, WITH ST. JOHN.

produced to satisfy a strong instinct of the soul, a personal love for the beautiful and the sublime. They became things to treasure and admire, not because they told the well-known sacred histories, but because they contained within themselves a world of independent and sensitive beauty.

Taine says somewhere that when a new civilization brings a new art to light there are about a dozen men of talent who fairly express the general idea, surrounding one or two men of genius who express it thoroughly. Crayer, Van Oost, Rombouts, Van Tulden, Vandyke, Honthorst surrounding Rubens; Ford, Marlowe, Massinger, Webster, Beaumont, Fletcher surrounding Shakespeare and Ben Jonson; Signinelli, Perugino, Ghirlandajo, Fra Bartolomeo, Andrea del Sarto, Giulio Romano, Leonardo da Vinci, Correggio, Giorgione, Titian, Sebastian del Piombo, Paris Bordone, Tintoretto, Paul Veronese surrounding Michael Angelo and Raphael Santi. The first constitute the chorus, the others are the leading men. They sing the same piece together, and at times the chorist is equal to the solo artist; but only at times. One of the chorus occasionally reaches the summit of the soloist's art, hits upon a complete character, a burst of sublime passion; then he falls back, gropes amid qualified successes, rough sketches, feeble imitations, and at last takes refuge in the tricks of his trade. It is not in him, but in great men like Michael Angelo and Raphael Santi that we must look for the attainment of his idea and the fullness of his art.

Leonardo da Vinci and Michael Angelo will ever be acknowledged the supreme masters of form and expression; Giorgione and Titian of color; Correggio of *chiaroscuro*, the Italian phrase by which we describe the just arrangement of light and dark in a picture, whether applied to colors or shades; but it was the combining of all these with such mastery, temperance, and moderation, that gave Raphael his claim to be considered the prince of painters, and moved his countrymen to surname him "the Divine"—*Il Divino*.

"The thing that is most worthy of admiration in Raphael," says Lübke, the great art historian, whom we shall have occasion to quote frequently, "is a certain harmo-

nious combination of all intellectual endowments, such as is but rarely seen even in the greatest artists; in only one other and very similar master of another art, indeed,—Mozart—does it occur in the same degree of perfection. While in other men, even of the first rank, one gift or another predominates, whether it be the gift of strong characterization or that of producing the highest expression of the sublime, in Raphael, on the contrary, we find all the individual traits of intellectual life incomparably equipoised, and the highest expression of this harmony is perfect beauty. But this beauty does not consist merely of sensuous loveliness or fascinating grace; it is thoroughly permeated by thought and strongly characterized. Each beauteous form nobly and powerfully expresses one or another feeling of the soul, ranging from the tender to the sublime. It is a noble spirit of morality that gives it its full nobility." This moral power, which is here adverted to, we recognize above all things in the process of Raphael's development.

ÆNEAS CARRYING HIS FATHER ANCHISES FROM TROY.

The family of Santi belonged to the best middle class, and was old and respected. Several of its members had distinguished themselves as artists and ecclesiastics. Their old home was in the small castle town of Colbordolo, until the reaving Lord Malatesta burned and laid waste the country in 1450, and drove them into Urbino. The father of Raphael, Giovanni Santi, was himself a painter of some repute and also a poet. About twenty of his pictures still remain. They show feeble color and rigid outline, combined with correct drawing and simplicity of conception. He was accounted one of the best of the Umbrian artists and a modest competitor of Perugino and Pinturicchio. One of his poetical productions, a quaint epic of two hundred and twenty-four pages, covering twenty-six hundred lines, in *terza rima*, celebrating the martial deeds and noble virtues of his prince and patron, the duke of Urbino, whom the democratic Sismondi calls the Mæcenas of the fine arts, and whose court Tasso described as "the stay and refuge of gifted men," is now in the Vatican library.

In the hill-side home at Urbino there is a fresco of the Madonna painted by Giovanni Santi, in which the face of the Virgin is a portrait of Raphael's mother, Magia Ciarla, who was the daughter of a wealthy merchant, and, according to tradition, a tender,

large-hearted woman, from whom the great genius inherited his warm, affectionate nature. Young Raphael is also in this picture. The face of the young infant Jesus represents him. The portrait is not as satisfactory as that in the Tiranni chapel frescoes at Cagli. It is amongst the angel faces, and gives promise in its ethereal spirituality of that refined beauty which distinguished him throughout his life.

THE TRANSFIGURATION.

Raphael's mother died when he was eight years old. Giovanni having lost three children also, and being left with this one boy only, very soon contracted marriage again to provide a head for his home and a woman's care over his beloved Raphael. This stepmother, Bernardina di Parte, a goldsmith's daughter, was a woman of upright character, with many excellent traits, but in every respect a contrast to the gentle Magia. So long as Giovanni lived the boy fared well enough. Most of his time Raphael spent in his father's studio, and was thus made familiar with the implements and terms of art from his earliest childhood. Several crude Umbrian paintings are claimed by tradition as his juvenile works, but their authenticity is doubtful. There is a tradition that Raphael received his first lessons in art from Luca Signorelli or Timoteo della Vite; but Lanzi, the historian of Italian painters, says that Raphael was instructed by Fra Carnevale, the best painter then in Urbino, whose pictures were certainly carefully studied by Raphael and Bramante. It is also reported that Venturini, the tutor of Michael Angelo, taught him the Latin language, and that Bramante, Pacciolo, and other members of the galaxy of learned men who were attached to the court of Duke Guidobaldo, assisted in other branches of his education.

Giovanni Santi died in 1494, leaving his widow Bernardina and his brother Don Bartolomeo Santi, a well-to-do ecclesiastic, to act as guardians for his orphaned boy. But Bernardina was too resolute and Bartolomeo too grasping and officious, and there was consequently constant bickering and disputes, the rival authorities being unable to agree as to the disposition of the Santi estates. Fortunately for Raphael, and for the world, a friend soon rose up for the neglected boy in the person of his mother's brother, Simone

THE VIRGIN ENTHRONED.

di Ciarla. He appreciated Raphael's genius, and, deploring his unhappy situation, arranged that he should be sent away to pursue his studies in art. After a careful consideration of the schools of Leonardo, Bellini, Mantegna, Francia, and Perugino, it was decided to commit him to the care of the latter, who was then at the zenith of his career, all Italy praising the celestial beauty of his creations. There is a tradition that the painter, after inspecting several of the lad's sketches, exclaimed, "Let him be my pupil, he will soon become my master."

Perugia, whither Raphael removed late in 1495, to remain there for nearly nine years, is one of the most picturesque of the renowned hill-cities of Italy. It is called the Nuremberg of Italy, on account of its quaintness of structure and its mediæval characteristics. Its ponderous walls and gray Etruscan bastions crown a high green hill, and are overtopped by a cluster of church towers and domes. The battlements command a magnificent view over the valley of the Tiber, and the white cities of Spoleto, Assisi, and Foligno, and along the lofty and aus-

tere Apennines, from Radicofani to the cloud-piercing Monte Caltrio. The steep and rocky streets open on paved squares, adorned with ancient sculptured fountains and papal statues, and overlooked by rugged Gothic façades, and vast silent churches, rich in mediæval monuments and Pre-Raphaelite paintings. The Etruscan city of Perusia which once stood here was destroyed by Augustus Cæsar, who replaced it by a Roman military colony, afterwards the prey of the Goths under Totila. In the Middle Ages it was seized by the ferocious Baglioni family, who held it for several generations, desolating the Umbrian Campagna by forays from their grim lair. These lion hearts guarded the city while Raphael dwelt there, and the public squares often ran with noble blood, when the rival Oddi chieftains were cut to pieces by their pitiless foes, and the cathedral was so stained with massacres that it was washed with wine and reconsecrated. The memories of these terrible conflicts, prolonged through the years of his sojourn, Raphael preserved in some of his paintings.

"One of the strangest phenomena of the Middle Ages," says Sweetser, "was the growth and culmination of the Umbrian school of painting in the midst of these scenes of rapine and carnage. Drawing their earliest inspiration from Siena, the Umbrian artists had preserved a quiet and contemplative spirituality of manner. With the grim austerity of its rugged heights and the sympathetic sweetness of its rich and flowery valleys, the land seemed created for mystery, and was peopled with legends. Isolated among the glens of the cloudy Apennines and remote from the influences of the history and art of pagan or papal Rome, as well as from the materialistic methods of the commercial cities of the coast, the spirit of the people was reflected by their pietistic artists, who formed what may be called the last group of purely Christian painters. The pictorial flowering of this devout spirit appeared in Bonfigli Santi, Francia, and Perugino, in pictures whose mechanical defects are counterbalanced by their evidence of religious enthusiasm."

Perugino was nearly fifty years old when Raphael came to him as pupil. In his great poem Giovanni Santi had extolled Perugino as one of the great masters in art. We may suppose, therefore, that Raphael approached the Umbrian master with reverence and admiration. Numerous works in various Italian cities, particularly in Florence, Siena, Pavia, Naples, Bologna, and even Rome, bore witness to the justice of his renown and general favor. Pope Sixtus IV had employed him in the Sistine Chapel, and his fresco of "Christ Giving the Keys to Peter" is by far the best of those painted on the side walls of that chapel. At the time of Raphael's arrival at Perugia, Perugino was engaged on the frescoes in the Sala del Cambia, the city exchange. He had many pupils, among whom were then La Spagua, Pinturicchio, Ferrari, and Alfani. But Raphael at once took a leading part in all this work, and in many of Perugino's paintings the brush of the young artist assisted freely. The fact of his having had Raphael for his pupil has, no doubt, in one way increased the reputation of Perugino, but it has also in some degree tended to lessen it, as in many of his best productions the work of Raphael is confidently pointed out by connoisseurs, and, indeed, many important pictures at one time acknowledged as Perugino's are now ascribed to his great pupil. With the exception, perhaps, of Francia, who in some respects is esteemed his equal, Perugino must be acknowledged as the ablest of the masters of the Umbrian school. Perugino's works are remarkable for delicate execution and especially distinguished by rich and warm coloring. One of the most celebrated paintings, "The Bewailing of Christ," is now in the Pitti gallery at Florence. An excellent example of his work may be studied in the illustration which enriches our article. The painting is in the collection of the National Gallery, London (No. 288), and is entitled, "The Virgin adoring the Infant Christ." In the New York Historical Society there is a painting of his, "The Adoration of the Infant Jesus," and in Yale College there is one on "The Baptism of Christ." Ruskin calls Perugino "a noble,

gracious, and quiet laborer—never weary, never impatient, never untender, never untrue. Not Tintoret in power, nor Raphael in flexibility, nor Holbein in variety, nor Luini in love,—their gathered gifts he has in balanced and fruitful measure, fit to be the guide and impulse and father of all."

Raphael's first independent picture is supposed to have been the "Infant Jesus and St. John," after a work by his master, and now in the church of San Pietro at Perugia; the "St. Martin on Horseback," now in the Städel Institute at Frankfort is one of the earliest of his original drawings extant. In both of these works we can not fail to recognize the Peruginesque influence. Yet, after all, there is also apparent already the young painter's growth in and striving after individuality, and that wonderful combination of the formative and inventive power which characterize all his productions.

In 1502, while Raphael was hard at work assisting his master in his studio in the Via Diliziosa, near the city hall, word came to him from his former fellow-student, Pinturicchio, that our young artist's assistance was desired at Siena, where Cardinal Piccolomini was employing Pinturicchio with the adornment of the cathedral library. The first and fifth of a series of frescoes treating of subjects from the life of Asmas Sylvius Piccolomini were done by Raphael, and they are now accounted among the greatest art treasures of that time. If Raphael had hitherto failed to gain for himself a positive position as an artist these works secured it, and henceforth his fame was heralded throughout Central and Northern Italy. His native city longed to do him honor. He was finally prevailed upon to return to the walls of Urbino. This was in the Autumn of 1504.

LA BELLE JARDINIERE.

Many changes had been experienced in this hill-side town. The viperous Cæsar Borgia had defrauded Duke Guidovaldo of his army and treasury, and then occupied his territories. A year later the Borgia pope and his evil son were poisoned; and the Urbinos expelled the alien troops and welcomed back their duke from his exile at Venice. With the return of this learned and pious prince the golden age returned to the city, and the foremost scholars of Italy entered her gates. This was a most oppor-

tune moment for Raphael's arrival. The Duchess Elizabetta and other high-born dames vied with each other in securing to the young painter the honors which he had earned by his works while at Perugia and Siena. His brush was kept busy, and social advantages were accorded to him such as no painter had ever enjoyed before him.

He was at once admitted to the intimate companionship of such men as Count Baldasare Castiglione, writer and diplomatist, Giuliano di Medici, brother of Leo X, and who, like his brother Lorenzo, was surnamed the Magnificent; Andrea Doria, the famous Genoese admiral; Pietro Bembo, the savant secretary to Leo X, and cardinal under Paul III; Bernardo Divizio da Bibiena, the author of "La Calandra," and the first regular comedy in prose that had been written in Italy. Raphael must have had frequent opportunity of listening to the conversation of Pietro Bembo, and of being charmed with his Platonic rhapsodies. To breathe such a cultured atmosphere must have been to a soul that could so swiftly seize, rearrange, and refashion whatever came within its ken and grasp an education of itself; and Raphael's familiar intercourse with the kings of intellect will account for much of the thought and mental elevation manifest in his works. For the classic tendencies of the court he found almost immediate expression in his charming little picture of the "Three Graces," in close imitation of the antique group he had seen in the *libreria* of the cathedral of Siena.. This gem is now in the gallery of the Earl of Dudley. "It is remarkable," says Passavant, "that the first antique subject painted by Raphael should have been that of the 'Three Graces,' to whom the painter of Urbino rendered more constant homage than any other artist of Christian times."

THE MARRIAGE OF JOSEPH AND THE VIRGIN.

A genius never rests. He may enjoy periods of repose and bodily recuperation, but his spiritual nature is ever active, ever planning, if not toiling. There is a constant upward growth in genius. Pent-up condi-

tions, circumscribed limits, narrow borders may do for the mass of people; a man of talent is restive under these restraints; a man of genius must burst its fetters or die under it. Raphael was a genius. He loved his home and its friends. He could never turn cold to Urbino. But he wearied soon of the quiet provincial town, and an inexplicable longing drew him away to wider fields of activity and knowledge. He had yet much to learn. He needed the incentive of greater works, and the inspiration of nobler types of art, and of grander lines of thought. The world was sounding the praises of Masaccio, Leonardo da Vinci, and Michael Angelo—the great Tuscan painters. These finally drew him away.

Florence was at the beginning of the sixteenth century not only the capital of Tuscany, it was the capital of the art world. It has been granted to only two nations, the Greek and the Italian, and to the latter only at the time of the Renaissance, to invest every phase and variety of intellectual effort with the form of art. Nothing notable was produced in Italy between the thirteenth and seventeenth centuries that did not bear the character and stamp of fine art. "If the methods of science may be truly said to regulate our modes of thinking at the present time, it is no less true that during the Renaissance art exercised a like controlling influence. Not only was each department of the fine arts practiced with singular success, not only was the national genius to a very large extent absorbed in painting, sculpture, and architecture, but the æsthetic impulse was more subtly and widely diffused than this alone would imply. It possessed the Italians in the very center of their intellectual vitality, imposing its conditions on all the manifestations of their thought and feeling, so that even their shortcomings may be ascribed in a great measure to their inability to quit the æsthetic point of view. . . . It was an age of splendid ceremonies and magnificent parade, when the furniture of houses, the armor of soldiers, the dress of citizens, the pomp of war, and the pageantry of festival were invariably and inevitably beautiful. On the meanest article of domestic utility, cups and platters, door-panels and chimney-pieces, coverlids for beds and lids of linen chests, a wealth of artistic invention was lavished by innumerable craftsmen no less skilled in technical details than distinguished by rare taste. From the pope in St. Peter's chair to the clerks in a Florentine counting-house, every Italian was a judge of art. Art supplied the spiritual oxygen, without which the life of the Renaissance must have been atrophied."

Raphael reached the city of the Arno while she was in the full flush of the dawning cinque-cento. The only story in the history of the modern world which rivals in concentrated interest the story of Athens is the story of the peerless city of the lilies, in that hour of the Renaissance. What a display of jewels met the eye of the young artist as he entered the city. There were the marvelous bronze gates of Ghiberti, the marbles and bronzes of Donatello and Verocchio, the enamels of Luca della Robbia, the monuments of the Medici, the vast cathedral dome of Brunelleschi, the Campanile of Giotto, the paintings of Masaccio, Ghirlandajo, Angelico, and the ancient schools, with the fresh wonders of Angelo and Leonardo. For the artist it was, indeed, a city of enchantment.

The brave Pietro Soderini was now Gonfaloniere. Pietro di Medici—that weak and imprudent and treacherous prince, whose only glory was that he belonged to a most distinguished house and inherited the rule of his father Lorenzo, "the magnificent"—had disgraced himself by alliance with the French, and had been driven from the city by a most indignant populace in 1494. There was, of course, a party in Florence continuing loyal to the Medici in spite of the imbecility of its last ruler. The lovers of art and literature were especially restless. They missed the rule of the Medici. For two centuries its princes had most gloriously aided all artistic and literary efforts. This was not the most opportune moment, therefore, for strangers to enter the gates of Florence and hope for notice. Raphael, however, experienced no disadvantage. He came with

strong letters of introduction. The artists at once opened wide the gates to their homes. The nobles also bade him welcome at their palaces. Besides these favors, which made his entry pleasant, the city itself, the proud activity of its daily life, and the metropolitan art air which seemed to pervade it, the numbers of students and the ardor of their enthusiasm, might at first daunt, but were sure immediately after to captivate and delight the soul of Raphael. The frescoes of Masaccio and Fillipino Lippi, in the Brancassi and Corsini Chapels of the church of the Carmelites, attracted him; they were famous for grand composition and soft coloring. Masaccio is usually called the father of modern art; he is certainly the father of realism in modern art. Sir Joshua Reynolds says: "He was the first who discovered the path that leads to every excellence to which the art afterward arrived, and may, therefore, be justly considered as one of the great fathers of modern art." Masaccio was the first Florentine who abandoned the formal method of Giotto, and distinguished himself by love of nature, richness of coloring, and subtlety of expression. He is said to have held Giotto by one hand and reached forward to Raphael with the other. The pictures of Leonardo da Vinci, whose battle cartoon was then on exhibition, also impressed Raphael with the deepest admiration. All who know what it is to recognize in the productions of others the fulfillment of their own best and most secret aspirations will comprehend the effect of the study of these two masters on Raphael's development. The works of Masaccio, with their grand grouping of figures and admirable treatment of the human form, appeared to have revealed to the young artist the extent of his own powers in a similar direction; while in those of Da Vinci he found intensified the same feeling for spiritual beauty which was already his own principal characteristic. The serene smile which afterwards graced the faces of his Madonnas he is said to have derived from the Madonnas of Leonardo.

"In Raphael's earliest picture produced after his arrival at Florence," says D'Anvers, "we can distinctly trace the working of the double influence." It is a Madonna known as "Del Gran Duca," now in the Pitti palace of that place. It owes its name to the fact that the Grand Duke Ferdinand III of Tuscany carried it with him on all his journeys, and prayed before it every night and morning. The Madonna is depicted in a flowing blue mantle, looking down at the infant Jesus; and the firmly outlined figures stand out in impressive distinctness. It takes rank as one of the masterpieces of Raphael, although the work was done when he was only twenty-one years old. In contrast with this, the work which, perhaps, illustrates best the ultimate attainments of Raphael in the height of his glory at Florence, is his Madonna entitled "La Belle Jardiniere," which is now the gem of the Louvre at Paris, and one of the noblest specimens of achievement in art.* It portrays the Virgin in a flowery landscape, looking with intense and vivid maternal tenderness into the celestial eyes of the child Jesus. The mother's face is full of indescribable beauty, and the whole picture is unrivaled for artless and idyllic grace and perfect harmony. Clement gives the origin of its name in a tradition that the model was a beautiful flower girl, to whom the painter was much attached.

---

*We have been favored with an illustration of it by the publishers of "Lübke's History of Art," as revised by that most excellent of American art critics, Clarence Cook. No better evidence need be cited to demonstrate how greatly art study is taking hold of this country than the publication of such valuable works. Messrs. Dodd & Mead deserve the thanks of their countrymen for giving them this publication in such elegant and complete form.

ROBERT RAIKES AND THE CENTENNIAL OF SUNDAY-SCHOOLS.

ROBERT RAIKES'S FIRST SUNDAY-SCHOOL.

THE year 1880 has the double distinction of opening the second century of Sunday-schools and the second seven years' course of International Lessons. On June 28, 1880, delegates from the Sunday-school organizations of all lands will gather in London to celebrate the former of these facts and to do honor to Robert Raikes, who is known as "the founder of Sunday-schools."

It has been well said, however, that he was rather their *finder* than their founder. At one of the earliest celebrations of modern Sunday-schools, in 1786, Dr. Glasse, in the sermon of the occasion, recognized that the essential principles of the modern Sunday-school movement are as old as Moses, by taking for his text, Deuteronomy xxxi, 12, 13: "Gather the people together, men and women, and children, and thy stranger that is within thy gates, that they may hear and that they may learn, and fear the Lord your God and observe to do all the words of this law; and that their children which have not known any thing may hear, and learn to fear the Lord your God."

This divine charter for public gatherings to teach the Law of God to adults, children, and strangers, is broad enough to be the constitution, not only of Robert Raikes's Sunday-schools, but also of the most advanced ones of to-day. Moses is really the human founder of Sunday-schools, and 1880 is not the one hundred and first year of the institution, but rather the three thousand three hundred and thirty-first. Deuteronomy contains the God-given seed of which the present Sunday-school movement is the harvest.

In the Book of Nehemiah we see the Mosaic plan of Sunday-school in actual operation. In the service of two thousand three hundred and twenty-four years ago, we see a gathering for Bible study of adults and children, including all who were old enough

to understand religious teaching, with a layman as superintendent, responsive reading, and the bowing of all heads in prayer. Fourteen teachers are mentioned by name (besides many Levites), who "taught the people" in groups, and "gave the sense and caused them to understand the reading," that is, the Law of God, which had been read responsively. But by all the lesson was not only "understood" but carried home, and carried out in the very acts of gladness and charity which had been taught. This chapter of history has the seed-thought of Chautauqua, an eight days' tent-meeting or "Assembly" for religious instruction.

So all through the Bible we read of gatherings for religious conversation, "hearing and asking questions," in temples and synagogues and private houses. In Christ's intercourse with the twelve we see the model Bible-class, and the missionary work of the apostles was more like our Sunday-schools than our preaching services. The catechetical teaching of children was a part of the Jewish and then of the Christian system.

The "Dark Ages" buried this element of Christian activity, but it was raised up again by the Reformation. One of the first results of Luther's work was the establishment of catechetical schools for the religious teaching of children, and wherever the tread of the Reformation was felt the same results were seen. Indeed, the degree of recognition given to childhood is a kind of thermometer to indicate the progress of an age or nation. As the Bible says much more of childhood than heathen books of the same age, and Christian countries always show far more regard to the little ones than other nations, so in the Dark Ages we find childhood's moral wants almost entirely neglected and the Reformation recalling men to the important work of Christian nurture for the young.

In more recent years there have been many solitary instances of Sunday-schools before the days of Robert Raikes. As early as the sixteenth century St. Charles Borromeo founded several Sunday-schools at Milan, Italy, of which some yet remain. About a century later Rev. Joseph Alleine at Taunton, England, adopted the plan of gathering the young for religious instruction on Sunday, and about the same time, in Raikes's own county of Gloucester. And a century before him Mrs. Catherine Boevey held a mission Sunday-school at her home every Lord's day. About 1740 a Sunday-school was opened at Ephrata, Pennsylvania, by Mr. Ludwig Hacker among the German Seventh-day Baptists.

The first Sunday-school of Scotland, it is said, was held in 1756 in the house of a Presbyterian minister. In 1763 a Sunday-school was established in Caterick, Yorkshire, England, by the Rev. Theophilus Lindsey and a benevolent lady named Cappe. Miss Hannah Ball, a young Methodist lady living at High Wycombe, England, started a Sunday-school in her native town in 1769. In 1770 the first Sunday-school of Ireland was opened by Rev. Dr. Kennedy in Bright Parish, County Down. All these modern Sunday-schools, and others, notably one in 1778 by Rev. Thomas Stock, who afterward labored with Raikes, were before Robert Raikes organized his Sunday-schools in July, 1780, from impulses received probably in the closing days of June, which suggest June 28th as the day to open the celebration.

There are always such anticipators of a great reform, whose skirmishing is heard in advance of the march of the Luthers who make the movement effective; but these solitary shots amount to little until the leader comes who is able to concentrate and organize these scattered forces and lead them on to decided success. Alfred Gregory in his biography of Robert Raikes, from which we derive many of the facts of this article, says on the point just referred to: "Raikes's distinctive honor lies in the fact that, having in common with kindred spirits perceived the advantages that would attend Sunday teaching, he did not content himself as did others with establishing a school or schools in his own neighborhood, but by means of his newspaper and other organs of public opinion he recommended the practice far and wide, and never ceased his advocacy till the scheme was generally adopted throughout the land. He found the practice local,

he made it national. It is upon this ground that admirers of Raikes rest his claim to the honored title of 'founder of Sunday-schools.'"

Robert Raikes was born September 14, 1785, a day celebrated by a Sunday-school jubilee in 1885, with two poems from Montgomery and other exercises, and an appropriate day for general celebrations in 1880 in all parts of the world.

His father was founder, editor, and printer of the *Gloucester Journal*, the ninth of English provincial papers, which, like most papers of that day was only as large as a sheet of foolscap, but numbered Rev. George Whitefield among its contributors and had become a paper of large influence when it was left in 1757 to Robert Raikes at the death of his father. Having been prepared for his editorial duties by a good education he carried the paper forward to yet larger success, and made it a layman's pulpit for the advancement of the philanthrophic and religious movements in which he was so deeply interested.

He came into his life-work of introducing Sunday-schools to the nation through the vestibule of lowly and local philanthropy in connection with the city and county prisons that were located in his native town. He was the John Howard of Gloucester, devoting himself earnestly to prison reform and providing for the starving and degraded prisoners physical and moral food. These prisons were as dark and damp and deadly as that one where the ancient prophet sank in the mire, and the moral darkness and death were yet more terrible. The prisoners for debt had no food provided by the authorities and were dependent on Raikes and other charitable people from whom he collected funds. In ministering to the bodies of the prisoners he came to see the yet greater destitution of their souls, and he sought by conversation, by providing occupation, by good books and in other ways to reform their terrible immorality. He recognized intemperance as the chief cause of this poverty and immorality and crime, and through his paper warned the people against drinking habits then so seldom condemned. His efforts for the reform of adults, whose evil habits were fixed and hardened, were so often unavailing that he was at last led to feel that prevention was not only easier and better than cure, but in many cases the only method of safety. He began to see that it was better to form childhood aright than to wait to reform manhood. He learned the chameleon's philosophy, to destroy crocodiles in the egg, and turned his attention to the rough boys and girls who were learning in the street school of a desecrated Sabbath the first lessons of immorality and crime.

The immediate suggestion of the Sunday-school came to Robert Raikes through what we call, in thoughtless moments, an *accident*, but recognize in more thoughtful hours as a *providence*. Having occasion to hire a gardener, he went into one of the degraded portions of the city to see a man who had been recommended to him for the position. He called at the man's house and found that he was out, but was soon to return, and therefore he concluded to wait. This unexpected waiting gave the kind-hearted philanthropist time to look about at the poverty and vice of that neighborhood. His attention was attracted by a group of half-clad and foul-mouthed children, and he spoke of his pain at the sight to a woman near at hand, who assured him that the condition of things was a thousand-fold worse on Sundays, when the children who worked on week-days, let loose for play and noise and riot, filled the air with horrible oaths that made the place seem more like hell than any thing else. The thought at once occurred to Mr. Raikes that this evil could and ought to be checked by some kind of a school on Sunday. He inquired for teachers in the neighborhood, and at once made a bargain with four to teach in their own homes on Sunday the children he should send them, in reading and catechism, at one shilling a Sunday. In this plan he had the hearty co-operation of Rev. Thomas Stock, the parish clergyman, who is supposed to have opened a Sunday-school in another parish, previously, as we have already intimated.

The same plan, prompted by the same

need, seems to have been independently introduced at about the same time in another part of this same city of Gloucester by a young Methodist lady, Miss Sophia Cooke, who afterward became the wife of Rev. Samuel Bradburn, a celebrated Wesleyan divine; but while the clergyman and the lady seem to have an equal share with Robert Raikes in the honor of introducing Sunday-schools in Gloucester, neither of them, nor any other person, can dispute with him the honor of introducing Sunday-schools to the nation.

The characteristics of those Sunday-schools as they appeared a century ago, deserve attention. The place was usually a private house. When application was first made for a chapel the trustees refused, saying that the children would "make too much noise and spoil the place." The time was from eight to twelve of Sunday forenoon, and from one to three in the afternoon, the school then marching to Church service in a body, led by the teachers, a point in which we certainly have fallen behind the past; and then another school session from 4:30 to 5:30 o'clock, in which the pupils were examined as to the text and sermon they had just heard, and given other moral lessons.

The teachers were "mostly pious," and all poor and were paid, with classes numbering from twenty to thirty-five, subdivided during a part of the day and taught by pupil teachers—the best pupils teaching the others in the simpler matters.

The pupils were exclusively ragged children of poor and vicious homes, from six to fourteen years of age, none being admitted outside of those ages. The boundary was rags on one side and childhood on the other.

The exercises consisted of "the three R's," reading, writing, and religion, including the alphabet, reading, spelling, numbers, Watts's hymns, prayers, catechism, reading three or four chapters of the Bible, a few remarks by the minister or by Mr. Raikes or some other lay patron of the institution, and once a month an examination in the catechism, with anniversaries in which stringed and brass instruments helped on the music—another point in which most of our Sunday-schools might learn something from the beginning of the century.

The rewards, which very properly occupied a prominent place in that mission movement, were mostly of a very practical kind, and appropriate for half-clad, half-fed pupils—clothes, boots, gingerbread, sweetmeats, books, Testaments, and Bibles.

The purpose of the Sunday-school, as stated by Mr. Raikes, did not recognize the central aim of such efforts, as seen to-day—conversion; but was rather to teach the pupils "to be kind and good-natured to each other; not to provoke one another; to be dutiful to their parents; not to offend God by cursing and swearing; and such plain precepts as all may comprehend." These excellent objects were largely accomplished, and the Sundays were changed from wild carnivals of vice to days of quiet and instruction. It was not long before Adam Smith, author of "The Wealth of Nations," seeing these results, and the yet greater ones in prospect, said of the new institution, "No plan has promised to effect a change of manners with equal ease and simplicity since the days of the apostles."

The results of these Gloucester Sunday-schools were widely published in the Gloucester *Journal*, and others were organized in quick succession in other places, until at the end of four years two hundred and fifty thousand children were members of these organizations.

The year 1785 is notable also for the formation of the first society for the spread of Sunday-schools, organized by William Fox, a wealthy and benevolent man, who entered upon the work with the lofty international purpose "that every person in the world might be taught to read the Bible," and gave the movement great help by his association.

About this time John Wesley, with his usual insight and foresight, wrote, "I find these schools springing up wherever I go. Perhaps God may have a deeper end therein than men are aware of. Who knows but some of these schools may become nurseries of Christians?" From that time forward Wesley took great interest in Sunday-schools,

and the Methodists were the first denomination to introduce them generally.

But Methodism has a yet more distinctive honor in the introduction during 1785 of *gratuitous* Sunday-school teaching, without which the institution could never have had its present wide and Christianizing influence. The expense of hiring teachers for the first four years amounted to twenty thousand dollars, and at the end of that time very many schools had to suspend for want of funds, and even in Gloucester only one continued its work. The large expense of hiring teachers seemed to be an insurmountable obstacle to continuing the institution.

"The idea of conducting Sunday-schools by unpaid teachers," says the biographer of Robert Raikes, "is said to have originated in a meeting of zealous Wealeyan office-bearers, one of whom, while the others were lamenting their inability to hire teachers, for want of funds, said, 'Let us do the work ourselves.'"

The Methodist Sunday-school at Bolton, famous also for its fine singing, is the first on record where gratuitous teaching was practiced, and others gradually followed until in a few years "gratis teaching" became universal. The biographer of Robert Raikes adds further to the honor of Methodism that "the Sunday-school idea, improved by the introduction of unpaid teachers and with greater attention to its religious character, was developed in the United States by Francis Asbury, the patriarch of American Methodism. He planted what may be termed the first American Sunday-school in Hanover County, Virginia, in 1786." In 1790 the General Conference of American Methodism "resolved upon establishing Sunday-schools for poor children, white and black." Even with it the institution was still bounded on the one side by childhood, and on the other by rags, including none but the "poor," and none of the poor but the "children."

In the light of these facts we can see clearly that the work of Methodism in the introduction of Sunday-schools was an immense broadening of its field by the introduction of gratuitous teaching, and a deepening of its work by "greater attention to its religious character," — Sunday-school prayer-meetings being referred to by Wesley as early as 1788.

To review the progress to this point we find that many in various nations and denominations, before 1780, independently of each other, saw the importance of Sunday-schools in their own towns and established them as a local institution. Robert Raikes seems to have been the first to conceive and publish the idea of the Sunday-school as a *national* institution, and William Fox the first to plan and organize to make it *international;* but when local, national, and international ideas were all threatened with defeat by lack of funds, Methodism supplied the sinews of war by substituting the heart for the purse, as the teacher's incentive, and and making conversion rather than education the teacher's chief aim.

But the Sunday-school was still regarded as only a "nursery of the Church," "a children's institution." While Methodism was adding gratuitous teaching and religion to the institution, Wales brought in the idea of adult classes, and thus broadened the membership of the schools and made them teaching services for the whole Church, old and young. One of their classes was known as "the spectacle class," being composed entirely of old men who were thus looking into the truths they were soon to see face to face. The Welsh were the first to recognize that the Sunday-school or Bible service, like the Bible itself, was profitable not only for conviction and conversion, but also for Christian edification. In this respect most American Sunday-schools are decidedly behind those of Wales of the past and present. where nearly all the children go with their parents to the preaching service, and nearly all the parents go with the children to the teaching service.

In the growth of this century-plant of modern Sunday-schools which Raikes planted and so many have watered, and to which God's Spirit and Providence has given such wonderful increase, we find just here in the Welsh movement a notable branch which has itself become a great tree for the healing of the nations. The Welsh Sunday-schools

led to the formation of the British and Foreign Bible Society. Rev. Mr. Charles, who introduced Sunday-schools in that country, walking, one day in 1802, in the streets of Bala, met a little girl of his congregation, and asked her to repeat his last text. The child wept and was silent. At length she said, "The weather, sir, has been so bad that I could not get to read the Bible." "Could not get to read the Bible? How is that?" The reason was soon ascertained. There was no copy to which she could get access either at her own home or among her friends, and she was accustomed to travel every week seven miles over the hills to a place where she could obtain a Welsh Bible to read the chapter from which the minister took his text. This representative fact impressing Mr. Charles with his country's need of Bibles, led him to urge the formation of a Bible Society for Wales, which idea was broadened by the suggestion of a friend, and the result was the formation in 1804 of a Bible Society for the world—which is only one of many providential branches from the Sunday-school movement.

Meantime, in 1791, "The First-day Sunday-school Society" had been formed by Friends in Philadelphia; in 1795 the institution had been introduced in Scotland; in 1803 "The Sunday-school Union" of London had been organized and had given an immense impulse to the new movement; in 1804 the first abiding Sunday-school had been established in New York City by Mr. Divie Bethune. In 1810 the institution was introduced in the West Indies; in 1815 into France; in the same year into Ceylon by Wesleyan missionaries, and in 1817 into Boston.

It is an amusing illustration of that conservatism which opposes every new thing that an institution so greatly needed and so evidently useful as the Sunday-school should have been opposed by many Church dignitaries and members on both sides of the sea. The teachers were charged with violating the fourth commandment and desecrating the Sabbath and also with violating the laws that required teachers of religion to be licensed, and for these offences teachers were threatened and arrested on complaint of Church members. Ministers preached against Sunday-school teaching as a crime against the divine and human laws just referred to, and threatened to exclude from the Church all parents who sent their children to the schools. Even in Boston, in 1817, the movement was bitterly opposed by many Christians who called it a desecration of the Sabbath, and declared that after a man had taught his own children at home on Sunday he ought to spend the rest of the day in meditation rather than in teaching other people's neglected children.

Since 1817 the calendar of Sunday-schools has marked a constantly rising tide of progress whose ripple marks are (1) the Convention movement, beginning about 1830; (2) the Institute movement, which quickly followed; (3) the use of uniform lessons by single denominations or single Sunday-school unions in England and America, which came in at about the same time, and improved until 1872; (4) the introduction of Sunday-schools on the continent of Europe during the last decade by Albert Woodruff, of Brooklyn, and the "Foreign Sunday-school Association" which he founded, and the various missionary Churches; (5) the international uniform lesson system, adopted in 1873 chiefly through the planning and pushing of Dr. J. H. Vincent, Mr. B. F. Jacobs, and others, which has already been introduced in nearly every nation of the world; (6) the normal class and assembly systems of teacher-training, introduced into general notice by a gathering of Institute leaders in Plainfield, New Jersey, in 1872, and the Chautauqua assembly in 1874, both inaugurated and conducted by Dr. Vincent, and leading to the establishment all over the land of Summer Normal "Assemblies" on camp-grounds, and Normal classes in the various towns for Winter drills; (7) the Chautauqua Local Institute; that is, the bringing of Chautauqua methods and teachers to the Sunday-school workers who can not go to the assemblies, by four-day institutes in the various towns, to which the assembly lecturers and Normal class teachers are brought for twelve sessions, the large

expense of such instruction by specialist being met by various devices and the contribution of benevolent Christians.

As to the *time* of the sessions our short Sunday-schools of one hour or a little more might, perhaps, learn something from the longer sessions of a hundred years ago, especially in mission schools, where the pupils get no moral or religious instruction except from the Sunday-school. Either by conducting the school *en masse* from the teaching service to the preaching service in the good old way, or by two sessions, or by both, a larger portion of the Sabbath than an hour and a half ought to be provided for in the case of those who have no religious influences at home. A second session for such a class of boys or girls, when most of the school are not mission scholars, might be held as a social and spiritual meeting in the teacher's home or some room of the church.

As to the *teachers*, there is cause to fear that we have not yet outgrown that state of a century ago that they are "mostly pious." Few absurdities have lived into the nineteenth century so painfully ridiculous as the custom of some superintendents who appoint men and women to teach regeneration who have not themselves been converted to present to Sunday-school pupils the saving blood which they have themselves rejected—their very appointment saying to a class that conversion is not very important after all. Christ's plan is first to ask, "Lovest thou me?" then, to appoint those who can answer yes to "feed the lambs." Any other plan is treason to Christ.

Teachers to-day have better weapons and more of drill than a century ago. It is time we required also of every teacher the public oath of allegiance to Christ.

As to *pupils*, we have learned that "children of very tender years" are old enough to be taught in the Sunday-school the simple truth of God. And yet there are many teachers of the little ones to-day whose blindness on this point is only half removed by the century's light. They would not, like Robert Raikes, exclude "children under six" from the Sunday-school room, but they do exclude them from the teaching of the leading Christian doctrines in the false idea that they "can not be explained to children," which many experiences deny; and they exclude them from the International Lesson as "too hard for them to understand," regardless of the fact that other teachers have actually made clear and practical to little children *every lesson* of the seven years' course, and shown that each one is written not only to "fathers" and "young men," but also to "little children." Especially sad is that blindness which excludes the little ones from efforts for their conversion and Church membership.

Nor has the century removed entirely the idea that the Sunday-school is for none "over fourteen." We enter its second century with some men still talking of it as "a nursery," and addressing it as "dear little children." One of the greatest works yet to be accomplished is to make all the Sunday-schools, as a few of them are to-day, Bible services for pastor and adults, as well as superintendent and children. The ignorance of the Bible among adult Christians every-where, and the spiritual weakness that accompanies it, can only be removed by such Bible services for old and young as Wales has set before us for a century, by a similar obedience to the divine order, "Gather the people together, men and women and children and the stranger, that they may learn and fear the Lord your God." There is something of impediment to adult membership in the retention of the institution's "child name," Sunday-school. Calling the older half of the gathering an "Assembly," and treating it as such, as has been suggested, will help the solution of this difficulty; but yet more depends on personal and local effort.

As to *exercises*, while in the main ours are a century better than those of Raikes, yet many schools might copy with profit the pastor's monthly review, the memorizing of choice hymns, and the examination of each class by its teacher as to the minister's text and sermon in the preaching service preceding. Especially should we guard against the mistake as to the *purpose* of Sunday-school work—so naturally made at first,

so culpable if made to-day—the idea that outward morality and *future* conversion is all that we are to work for. A hundred years of experience in Sunday-school labors have taught many, and should teach all, that the true aim of Sunday-school teaching is conversion now in childhood and present upbuilding in actual Christian life.

At the second centennial of Sunday-schools they will have grown out of the "school" errors of the institution as it is commonly found at present, and into the *home-like* and *Church-like* excellences toward which we aim. When teachers become teacher-*mothers* and teacher-*fathers* to their classes and bring to them the atmosphere of *home*, the evils of lecturing and cold mastership will give way to ready questioning, free conversation, and loving fellowship; and as the truth that the Sunday-school is the teaching-service of the *Church* for the conviction, conversion, and culture of old and young gets down into the hearts of Christians generally, the lack of teachers, of adult classes, of funds, and of conversions, so painfully apparent in most Sunday-schools today, will change to a generous supply and its resultant fruitage.

MY LITTLE PRIMROSE FLOWER.

THERE grows a golden primrose
In a lone mossy dell;
The place where grows my primrose
I 'll not to any tell;
Beneath the shelter of an oak,
That 's wrinkled gray with age,
My pet flower blossoms sweetly there,
Safe from the tempest's rage.

A little rill that trickles by
Makes music to my flower,
And wafts itself in dewy spray
To cool its mossy bower.
The speckled trout leap up with joy
When bright it shines and clear,
And April brings its gentle rain
My little flower to cheer.

Spring wakens Nature from her sleep,
There little birds do sing,
To see the trees put forth their buds,
And flowers begin to spring.
The robin makes his cozy nest
Beside my little flower,
And close beneath its shel'tring leaves
His little brood does cower.

When in the west the evening star
Shines like a diamond bright,
The feathered choir in brake and brier
Sing sweet their last good-night;
And ere the morning star has sunk
Behind the Cheviots gray,
They sing to my flower in its mossy bower
Their hymn to the coming day.

At morning dawn a sunbeam steals
Where my pet flower is laid,
And wakes it with a warm soft kiss
Upon its golden head.
My virgin flower, like maiden pure,
Lifts its head to the azure sky,
And wafts perfume from its golden bloom
On the breeze that passes by.

Then come the bees through budding trees;
With a hum of joy they sing
To the flower of my little primrose,
The queen of early Spring;
From its cup of gold they sip
The honey sweet and clear,
And carry home with joyous song
The first fruits of the year.

As 'neath this old oak tree I sit,
I think of boyhood's day,
When, spotless as the primrose flower,
On the sunny bank I lay;
I gazed from earth to vaulted sky,
Till I seemed borne away
To a land of bliss, unlike to this,
Where flowers know no decay.

ERASMUS OF ROTTERDAM.

A MODERN historian says, "If we except the apostles, no body of human beings ever printed so deep a mark into the organization of society as did the Reformers; and if there be any value or meaning in history, the lives, the actions, the characters of such men as these can be matters of indifference to none of us." Whether the name of Erasmus may be properly ranked in this body of human beings is still an unsettled question. Biographers differ widely in analysis of the motives that governed his life. Perhaps Motley was right in concluding that had there been only such reformers as this peace-loving Dutch scholar, the Reformation would have been retarded centuries. Without stint he accords highest honor for his influence in refining taste, elevating scholarship, driving out "the owlish pedantry that had so long flapped and hooted through mediæval cloisters;" but he adds that in the religious strife his name is undeserving of praise.

Grotius says, "but he showed the road to a reasonable Reformation," and Motley replies that if that be true, he was careful not to venture upon it himself to a point of possible danger. Nor does Erasmus, shrewd, vain satirist that he was, allow himself the delight of any self-deception on this point. "I am not," he confesses, "of the stuff of which martyrs are made. I am not of a mind to venture my life for the truth's sake. For me, if it came to the point, I should do no better than Simon Peter."

And when it came to the point he did not much better; yet whether Reformer or only mild rebuker of papal wrongs, whether satirist or slave of the Church, such was his influence over the intellectual life of his age that he, without knowing it, sowed seeds for the great religious harvest. He planted for Luther to reap. Whatever he may have proved when the great religious crisis was upon the Teutonic world, he was a Reformer *before* the crisis came. If he was laggard or coward in the strife, he yet saw it coming with a prophet's vision, and helped it to advance with the scourging satire of his pen against monastic abuses and priestly ignorance and vice.

The Reformation, standing out as it does clearly defined against the background of the ages, has such a prominence among the world's religious events as tempts us to forget that it did not spring into existence like a tornado, whose track we can not trace. We forget that it was the child of slow processes of reaction and rebellion against tyranny, superstition, and greed—the child of the light, that had come as unheralded and as silently as the dawn. Thought was its mother, prayer its nurse. Great souls, here and there, with all the elements of the Reformation in them, had been struggling against spiritual thralldom for generations; great minds had been thinking out the problem of human destiny as affected by the ecclesiastical attitude toward the people, and among these minds none was more profound in research, more liberal and kindly in purpose, more earnest in the dissemination of light than that of Erasmus, the most eloquent theological and classical scholar of his age.

While it is the connection of his career with this great vital religious problem that naturally arises in contemplating his life, yet apart from that connection the life is full of interest as a special illustration of what may be achieved by genuine love of learning dominated by a resolute will. Impossible as it is to reproduce in any degree a vivid picture of his career, yet a brief outline of a few of its prominent events may help us to rightly estimate the character to which, as Dean Milman says, it is difficult to be calmly just.

In a certain sense Erasmus was a man of all ages and times, and, in speaking of his babyhood it is not easy to put it back to a quarter of a century before the Western world was sought by Columbus. The pitiless hand of the monastic system, specially

covetous of the youth of the land, had blighted his life from his birth. His father, Gerard Praed, one of the ten sons in an humble household, had been designed for the life of the cloister, which he escaped by fleeing to Rome, where he earned his livelihood by transcribing classical works, since the day of printing had not come. Gerard afterward took upon him the vows he had abhorred, and left the care of his son to his mother, Margherita, the daughter of a physician who had been an early friend.

To induce him to take the step that parted them forever, a rumor of Margherita's death was brought to him in Rome, and before he discovered the deception the irrevocable vow had been spoken that condemned him to the life of a monk. The little lad bore his father's name, Gerard, Latinized after a while into Desiderius, and then changed by himself to the Greek Erasmus. It would not have been strange if his hatred of monkhood had been imparted as soon as his infant mind could be taught to hate, but his mother evidently forgave the institution that had robbed her of her husband and her child of its parent, perhaps, because she knew no better or other way to educate her boy than to accept for him what the ecclesiastical scholars could give.

We hear of him first at a school in Gonda, whose teacher thinks him a dunce. But at nine years of age they discover that the lad's voice is pure and sweet, and he is taken to Utrecht to become a chorister in the cathedral. Then, too, he became a pupil at Deventer, a school kept by a religious brotherhood not bound by vows. Here his mother came with him and personally watched his progress, securing him instruction in drawing and designing. Here Hegius was his teacher, and, differing from the earlier instructor, prophesied that the boy would attain to the highest summits of learning. Erasmus says of this school, that here he went through the whole course of scholastic training, logic, physics, metaphysics, and morals, and learned all of Terence and Horace by heart. Yet, even here, that which Milman calls "inveterate monkish proselytism had begun its work upon him." To show the secret of some of his after bitterness of feeling on this subject I quote from his own account of these trials. "There was no youth," he says, "of good fortune, whom the monks and friars did not study to break and seduce to their service. They spared neither flatteries, insults, terrors, nor horrible tales to drive us into the fold. I was of a very pious disposition, but wise enough to plead that I could not take vows without my parent's permission." But the harassed boy was soon deprived, alas! of even that excuse by the death of both his parents. There was some property, and his father had left it in charge of friends, who proved utterly unfaithful to their trust. Desiring the money for themselves, it became now more important than ever that they should induce the boy to enter the cloister. The fortune was sufficient for his education, and the father's desire accorded with the ambitions of the son, that the latter should be entered at one of the famous universities of Europe. But university life was costly, and instead of entering upon it, the youth was sent to an institution at Herzogenbusch, conducted by a brotherhood who made it the object of their school to train youths for the cloister. Here he remained during two of the most impressible years of his life, and the pictures of his school life as delineated by one of his biographers leave no room for surprise at the pitiful and paralyzing effect upon the young scholar's mind.

Ignorance, bigotry, and cruelty marked the character of his instructors. He had already outgrown their knowledge; but, while unable to instruct him, they would not allow him to instruct himself. When fasting had reduced the body to weakness, the mind was assailed by all horrible tales of the fate of those young men who refused the sheltering sanctities of the convent. Goblins and devils were invented to startle the imagination, penalty followed every deviation from the rules of the order; scourgings were a frequent discipline; yet the boy resisted persuasions and persecutions alike, and pursued with unswerving fidelity his purpose to devote himself to study.

Yet this very longing to study which

proved the strongest ally to his resistance against a monastic life became when all schemes failed the great temptation to that life. He had had a lonely boyhood, and homeless and motherless, his heart a gentle heart from first to last, held closely to his friends. And the one intimate friend of his boyhood, a schoolmate at Deventer, older in years than himself, selfish and ambitious, had entered a cloister at Stein. "Not," says one, "from piety, but for ease and self-indulgence as the last refuge of the needy and idle."

Through the representations of this friend as to the charming life of literary leisure the convent afforded, such as books without stint, companionship of men in sympathy with his own pursuits, untrammeled freedom, uninterrupted time, he was persuaded to enter upon his probation there. His hunger for knowledge overleaped all barriers raised by his conscious unfitness for the life. He loved freedom, but for freedom to study he would be a slave in all things else. His body, frail and sensitive, was unfit for vigils or fasts, yet he would suffer hunger and cold, and mind it little, if only he could feed the brain and keep the lamp of thought aglow. And this he did, till blinded by its light, he reached the edge of the precipice, and was ready to take his final vows, before he saw clearly the reality of the monastic life, to which he was about to be irrevocably sealed.

Then, indeed, he drew back, pleaded, rebelled, struggled in the ever-tightening bands, but in vain. His guardian, to whom he sent in his despair, fearing, perhaps, that if his victim escaped, he might be required to account for the youth's inheritance, opposed his release. His friend, unwilling to resign so cheap a tutor, gave the struggling boy no aid. All influences urged one way, and under the combined pressure Erasmus took on his lips the vows against which already his heart rebelled.

Had he found his new life a continuation of the old, the monk might have been lost in the scholar, and instead of its severest satirist the monastic system might have found in Erasmus its ablest defender. But, alas, the promised leisure for study was now filled with rigorous, often menial labors. Meaningless prayers were multiplied on his unwilling lips, harsh discipine took the place of fatherly sympathy, and refined companionship gave place to enforced association with disgusting and ignorant men. If, as many think, Erasmus revealed in this his first yielding of conviction to the pressure of cowardly expediency, the weakness that marred his career at every critical moment of his life, he ought certainly to have learned a lesson from the bitter repentance that followed his first attempt to accomplish his desires at the cost of his conscience. And he did learn, in part, so that for many years he was careful to what yoke he bowed his head, and once free he tried to keep free from the ecclesiastical chain. Had he endured to the end, had he not at the last bowed in all the strength of maturity as here at Stein he bowed in youth to the mandate of the Church, there would be no doubt to-day of his place in the ranks of reform.

The five years of cloister life, in which the young brother gave himself to learning with all the devotion of a heart that has nothing else to live for or to lose, were not lost years. He shared in no revels of the monks, and, on the contrary, was unsparing in his contempt of the profligacy and ignorance of the fraternity, who hated him as he scorned and sneered at them.

They were not unwilling to part with him, when the bishop of Cambray, who had heard of his learning, desired him to go with him as his private secretary to Rome. The journey was not taken, as the bishop lost his hope of being made cardinal; but he retained Erasmus in his service, and after a time promised to grant him the desire of his heart, a chance to study at a university. He had already taken priestly orders, and the bishop promised th support him at Paris at college, support which, it must be said, he utterly neglected to bestow. If the life at the monastery of Stein was hard what can be said for that in Paris, which was far more comfortless and severe? No description can equal that given by Erasmus himself.

Reading of these hardships we no longer wonder at the exceeding care which, in after life, Erasmus took of his health. From the illness contracted in Paris he was never in his after life free, and robust men have sneered at his love of ease and his tender care of the body, forgetting how closely courage is allied to good digestion. If the sons of the rich, who could pay for outside luxury, suffered, how much more the poor student, who had absolutely nothing but his pensionate or right to shelter and food in the college, from hard bed, scanty food, rigid vigils, and unceasing work. "In the first year of my experience," he says, "I saw many youths of great gifts, of the highest hopes and promise, some of whom actually died, some were doomed for life to blindness, to madness, to leprosy. No one was exempt from these dangers and disciplines, and even the generous spirits of the sons of the affluent were broken under them. Personal chastisement was not uncommon. They breakfasted on bits of dry bread; they were sent in the depth of Winter to the well for water, and this was often frost-bound, or fetid and unwholesome. The sleeping rooms were on the ground-floor, and the walls were damp with mold and plaster, and the beds stocked with vermin."

On the promise of the bishop to provide for him Erasmus soon learned that he could not rely. The money for clothes, for books, fees, and lectures was, if at all, only irregularly supplied. Surely a mind that under such conditions so grew in knowledge that, notwithstanding his homeless, orphaned, and friendless poverty, it attracted the friendship of the most distinguished scholars in Europe, was one of no ordinary fiber and force. Already literature was making for itself a kingdom in the world apart from the Church, and through the open portals of thought the young scholar passed swiftly and took his own high place. For the mind he used every advantage offered by the college, and for the necessities of life he began to take private pupils, and his reputation for learning brought to him pupils from the wealthiest and most distinguished names in the land. So many desired his instruction that he could choose the best. He began with the son of a rich burgher of Germany, who gave place to a member of the almost royal house of Grey.

With the superintendence of the education of Lord Mountjoy began a life-long friendship that affected all Erasmus's after career. It took him to England, and opened to him some of the most charming phases of English life. The pension his pupil settled upon him later was continued through the years. At first, driven by necessity to accept whatever pupils offered, he was soon able to refuse offers like that of the Earl of Derby, who promised a benefice, a loan of three hundred crowns, till it should be vacant, and one hundred crowns a year if the great scholar would prepare the earl's son for a bishopric. His employers became his patrons. Lord Mountjoy proved a liberal host, and the finest minds of the kingdom gave him warm welcome. He found quick recognition and true appreciation in scholars, and the nobility flattered and petted and heaped presents upon him. He began now the friendship with More, which was the solace and delight in all the after years to both. During this visit to England he learned Greek, in which he could have had instruction in Paris but for the pitiful lack of means. In Latin no one surpassed him, though Budaeus, who was at the same time his friend and his rival, was the better scholar in Greek. English he did not understand at this time, nor ever after. He disdained all modern languages, and when later in life he was presented with the living of Aldington in Kent he resigned it on the plea that he could not pretend to feed a flock of whose language he was ignorant.

During this first visit, which lasted two years, he was a pupil more than a teacher; his promise received the adulation that only fulfillment merits, and he went away laden with the gifts of his friends. During the seven years that passed before Erasmus returned to England the promise of his youth had, indeed, been fulfilled,—he was the great Transalpine scholar. Those years had been passed in Paris, whence he was twice driven by the plague, in Holland, and various other

countries, living every-where the life of a scholar and teacher, constantly growing in reputation and power. No one ranked with him except Reuchlin, whose fame was confined chiefly to Hebrew learning, to which Erasmus made no pretension.

In this interval had appeared the first edition of his "Adagia." Its vast erudition excited the admiring astonishment of the world of letters. This work traces to their origin, says Dean Milman, all the strange and recondite sayings of classic authors. Erasmus arranged them under different heads in alphabetical order, and sometimes took one adage as a text for a long dissertation, and the work is, therefore, a very curious storehouse of his opinions. Under Simulation and Dissimulation he discusses the wealth and pomp of the clergy. On "Macho Indoctine" he brands the ignorance and immorality of the monks.

The most obscure writer receives his notice? The extensive reading the work reveals astonishes even students, and, if for nothing else, it deserved its reception as a gigantic monument of industry. Edition followed edition. Paris, Strasburg, Venice all reproduced the work, and every-where the people waited for it to be prepared.

A second short visit to England renewed his friendships, though the most precious, such as that with More and Colet, had suffered no interruption. He resided for a time at Cambridge, and received the degree of doctor of theology. This visit refilled his purse and enabled him to carry out his long-cherished hope of visiting Italy, whither he went in 1507.

He brought to the sunny land a scholar's dreams of open universities, of rare libraries, of cities where every enthusiasm for literature or art was encouraged, where lavish and princely patronage awaited the man of letters. He stayed long enough to know that the country was no peaceful retreat for meditative minds, but was utterly given over to convulsions of war, and that prelate and prince, and even the pope himself, went forth to battle, not exactly for the cause or with the weapons prescribed by the Prince of Peace.

This state of things supplied the pen of Erasmus, whose nature and principles were both of a most peaceful order, with abundant subjects for satire, which he used unsparingly alike on whining monk and martial pope. At Turin the university presented him with the degree of doctor of theology; at Bologna he lived a year, and during this time the plague, which had twice driven him from Paris, broke out, and the physicians and watchers of the infected persons were distinguished by a white cloth upon the shoulder. Erasmus, who had never laid aside the white scapula of his order, was mistaken for one of these attendants, and as he prided himself on not knowing a word of Italian, came near losing his life in a mob on account of wearing the plague mark and yet mingling with people who feared contagion.

In Venice he superintended his work through the famous Aldine press, and became a warm friend of the Aldi. At Padua the brightest minds of the day vied in showing him honor. In Rome the cardinals who were patrons of letters bestowed upon him every attention, and the pope gave him a dispensation from his vows, and offered him every emolument to induce him to remain in Italy and give his learning and talent to the service of the Church. But Erasmus, already skilled in temporizing, though he responded to the pope's wish in so far as to give before him an exhibition of his power in debate, arguing at different times both for and against the projected war against Venice, yet in his heart scorned the public acts and private life of the papal court, and above all things had a deep-rooted hatred of war. He did not say much about it, however, until he was well on his way to England, where he was induced to return by the persuasions and promises of his friends on the accession of Henry VIII to the throne.

On the journey northward over the Alps and down the Rhine the scholar's opinion of the condition of pope, cardinals, and priests, and his views of the papacy itself, found voice in the famous satire called the "Praise of Folly." His habit was to compose and arrange as he journeyed, and to

write out his thoughts when he stopped at night. He finished the composition after he crossed to England in the house of Thomas More, who, his biographer says, enjoyed the kindred wit, nor took alarm at the tremendous sarcasm against the whole papal scheme.

No adequate impression of the work can be given in a few words. So great was its popularity that seven editions sold in a few months, and twenty-seven during the author's life, and it was translated into many tongues. The famous colloquies that followed were not less bold nor less popular. Both works, says one, were in every house and school, and we suspect in every cloister. The "Encomium" handled every thing weak or wicked in monkish or priestly ways with a touch sweet and playful as that of a child, but under the words was the sting and sneer of the most biting sarcasm. The "colloquies" did not let one superstition go unmocked or one vice escape the scourges of his scorn.

At first the ecclesiastical world laughed with the rest, though for far less heretical words men have been persecuted and burned at the stake. And when the Church recovered from its astonishment and began to see itself caricatured and offered its indignant protest, it only served to advertise the work, till when news of the proscription of the "colloquies" arrived, a printer of Paris immediately struck off twenty thousand copies more. It was not altogether a satisfactory life in England. King Henry's patronage did not fulfill the expectation which had lured the scholar back to his realm. Cardinal Wolsey's noble promises of nothing less than a bishopric ended in words. Through the influence of the bishop of Rochester Erasmus was made professor of divinity at Cambridge, and afterward professor of Greek. His rooms were in Queen's College, and a walk is still called by his name.

But even Cambridge was a disappointment. The pupils were few, he missed his London friends Mountjoy and More and Colet. Between the two latter and himself an ever growing friendship existed. More afterward withdrew from the Romish Church, but was at this time tolerant of its abuses, and tolerant too of the satire of Erasmus against them. With Colet's ideas he was in full sympathy, and like brothers they warred together against the scholasticism which had already lost its hold in part, but which still fought in the cloistral schools and wherever in the colleges the Church held sway against the new and more liberal education. Not content with attacking abuses, says D'Aubigné, he labored to recall divines from scholastic theology to the study of the Scriptures. "The highest use of the revival of philosophy," said he, "will be to discover in the Bible simple and pure piety." "I am firmly resolved," again he said, "to die in the study of the Scriptures."

Dean Colet's school at St. Paul's had the help of Erasmus's pen in favor of its teaching and the benefit of text-books and manuals prepared by himself. He wrote not grammars only for his friend, but hymns and prayers to the child Jesus, and during all the years of his stay in England threw the weight of his influence toward a more liberal and refined education.

Various reasons have been assigned by authors for his departure from Cambridge, chief among which lies disappointment in his English career and hope of a wider field at the court of Charles of Austria, who had invited him to the court at Brussels or at Rome, where his old friend Cardinal de Medici was now as Leo X occupying the papal throne. Charles made him councilor, with small salary and the privilege of residing where he pleased. The pope offered a bishopric in Sicily, but Erasmas, who liked to have all things offered, was yet careful to accept no duties by which his liberties of movement could be curtailed. He had no kindred, and his native city had never been his home. He belonged to all times and to the whole world. Books and manuscripts were scattered widely. Printers to whom great works could be intrusted were very few. He lived in libraries. Some one says three things made home for him—books, printing, and literary friends.

At this time there came from his old convent at Stein an invitation to return. The

brotherhood envied the world the possession of its great scholar. Erasmus's reply to this invitation is one of the finest of this great collection of valuable letters. It is a dignified letter, but the fire of contempt for the whole system, kindled by the hard experience of his youth, had never gone out, and fed by the observation of the years it flamed out in scorching words that must have burned in the hearts of more cloisters than that of Stein. There was no temporizing or hesitancy of utterance on this point. He denounces the degeneracy, ignorance, selfishness, and sensuality of the system with unsparing scorn.

Suggestions constantly arising in the study of his life as to his lack of courage, make peculiarly refreshing this fearless outbreak of his opinion. His position, already secured, as the greatest scholar, and almost the greatest theologian, of his day, allowed him freedom of speech that would not have been granted to any other. He denounced, condemned, ridiculed every clerical abuse, and though an object of jealousy and suspicion, he was also an object of fear. He spoke bravely, overcame easily his few opponents, and required no great courage in the earlier part of his career. His vanity was nurtured by adulation, which he was accused of seeking; but which came often, too, unsought, and the proudest cities were proud to secure him as a resident. From the court of England he was tempted to the court of Brussels, but Henry VIII would have had him back on almost any terms. The Archduke Ferdinand paid him the greatest attention. The elector of Bavaria offered him the presidency of the university at Ingolstadt. Sigismond, the king of Poland, sent him letters and gifts. The king of France invited him again and again, and the popes of his day made most flattering offers of positions of influence and power, while the scholars of every land united to do him homage. The work that he did with the aid and comfort of this adulation was noble work for religious freedom; and that he could not have been its martyr should not rob him of the honor of preparing the way and making the paths plain for those who were to come.

As time passed on and the marvelous effect of his writings was felt, there was aroused against him the bitterest hatred from the orders whose vices and weaknesses he mercilessly exposed. It was at its worst, perhaps, when, in 1516, he went to Basle, and issued the first printed edition of the New Testament from manuscript, a work which required no common honesty or courage, "for it presumed," says Milman, "to call in question the authority of the Vulgate, which had held uncontested sway over the western mind for centuries." He says suspicion, jealousy, as well as awe, greeted the work. Scholars and pretenders to learning fell on it with rabid violence; but it had the pope's name on its front, and behind that Erasmus fought till he silenced all controversy. The immense industry required for the work, as well as its critical ability, should have secured the admiration of all modern Biblical scholars.

Says one author, "Erasmus was the parent of all Biblical criticism;" another, "He was not editor only, but interpreter of the New Testament to the western world." Another calls him "the parent of sound, simple, historical exposition of the sacred writings." Milman says, "He struck down boldly through layers of mystic, allegoric, scholastic, and traditional lore, which had been ages accumulating over the Gospel, and laid open the vein of pure gold, and gave the obvious literal meaning of the apostolic writings." A translation of the paraphrases was ordered to be placed in all English churches.

But having furnished a key to the treasure-house of Scripture, he wanted all the world to enter, and we hear his voice ringing out for once boldly as Luther's, when he says, "I altogether and utterly dissent from those who are unwilling that the Holy Scriptures, translated into the vulgar tongue, should be read by private persons, as though the teachers of Holy Writ were so abstruse as to be only intelligible to a very few theologians, or as though the safety of these Scriptures rested on man's ignorance of them. It may be well to conceal the mysteries of kings, but Christ commanded that his sayings be published as widely as possible." "Would," he

adds, "that the Scriptures were translated into all languages, that they might be read and known not only by Scots and Irishmen, but even by Turks and Saracens;" and (wonderful stretch of the masculine magnanimity), he is even willing that *women* should read the Gospels and the epistles of St. Paul.

At whatever conclusion the student of the life of Erasmus may arrive concerning its great controlling principles, he can not fail to be impressed by the evidences of its very remarkable industry. The aggregate of his work in comparison with that of modern scholars is immense. In the classics he edited editions of at least ten of his favorites both in Latin and Greek. His treatises, expositions, and controversies were voluminous, and his valuable epistles are almost beyond compute. Nor was this all. His editions of the early Fathers, ten in all, began with his favorite, St. Jerome, with an attempt at the entire works of Origen, at which he was engaged at the time of his death. His biographer says his books were many in number and size; many folios closely printed, and filled, some of them, to the very margin, testify to his untiring industry. At the time of the preparation of his edition of the New Testament Erasmus, declining all offers of residence at court made to him by different monarchs, chose to establish his home in Basle. Thither came to him letters from kings, praises from scholars, homage from the whole world of letters. Homeless, he had made all cities proud to be his abode; friendless, the greatest in all nations vied to do him honor. Free from the thralldom of monastic brotherhood, he entered with all humanity into fraternal bonds.

His best work was done. No man had done more than he up to this time to expose the degradation of the fallen Church; no voice had called through the nations more publicly than he, "Prepare the way of the Lord." He was at the zenith of his fame. It was a good time to die. Had he died then the Reformation would have come all the same; his great work in preparing men's minds for it would have been acknowledged, and his after history spared the shadow that darkens the page.

As we approach that shadow Erasmus's favorite maxim arises naturally to the mind, "Let in the light, and the darkness will disappear." We let in the light of every excuse upon his action, or rather his lack of action, when the Reformation burst upon the Teutonic world at the burning of the papal bull. We remember his immense service in opening the eyes of thinkers every-where to the dangers of monkish superstition and of papal despotism. We see his touch in the slow gathering cloud, and try to forget that he shrank when the cloud became a whirlwind and the tempest threatened destruction to that which he had so striven to overturn. We remember that years were creeping upon him, and physical weakness called for repose and not for strife. We remember that from nature and principle he hated warfare, and that in his mind the woes and cost of battles far outweighed the value of any victories that might be won. Again, we remember that he knew no weapons but those which the student wields. Absolute truth, he reasoned, was not essential to the vulgar mind, but for those only who could receive it. Give all the Scriptures, give learning to all who could receive it. Leave the leaven to work, and gradually the minds of the few would drop their garments of evil and stand forth clad in the light. Evil practices and superstitions would depart before the dissemination of true teaching, and excitement and violence, he thought, only stood in the way of the light.

These were, we must admit, real sentiments, not born of timidity, but acted upon as truly before as after the crisis came. To espouse the cause of Luther, after Luther's manner, was to act against his judgment. He did not think Luther's way was best. Strange as this may seem to us, the faith of Erasmus in a peaceful Reformation had its ground in the work of his whole life. To abandon his theory was to go contrary to his convictions—to abandon his methods. The abuses against which Luther fought Erasmus had already attacked with his pen, but when called upon for more zealous warfare, he counseled a more prudent and pa-

tient strife. He would have had Luther protest and remonstrate, but his protest should be offered in conciliatory spirit, and not in a spirit of open revolt. He would have had the Church, on the other hand, abate its abuses, purify itself from within, using clemency and mercy even toward her accusers. He wanted them to "let in the light," but not to curse the torch-bearer. He approved no thunderings of revolution, on the one hand, and no tyranny over thought, on the other.

Nothing can show more clearly his misapprehension of the importance of the contest than this pacific attitude. It was no time to be on both sides of the question, and the day of mediation was past. Secundus Como says, Luther felt the whole career of Erasmus gave him a right to expect his support, and through him the support of the educated classes, which his literary reputation placed so largely under his control; and, therefore, he could hardly be patient with the scholar's vacillations and inconsistencies. "You are trying to walk on eggs without breaking them," said he; while adherents of Erasmus, deploring the rashness of Luther, said, "Luther tries to force the door of which Erasmus had already picked the lock," and that Luther only "hatched the eggs which Erasmus laid." Luther, however, disowned the brood, and felt, what later thinkers have often said, that had the Erasmian ideas prevailed, the educated classes would have been mere skeptics, the multitudes sunk in superstition.

So, though Erasmus had pointed his lance stinging with satire at every opinion and practice condemned by Luther; though on many vital questions they were agreed; though Erasmus's knowledge of ecclesiastical literature gave him weapons against error such as Luther could not wield; though they both appealed to the Scriptures as the standard of truth,—yet the two men could not make common cause. To Luther the truth was every thing, the truth he must have at any price. For Erasmus, the truth, if peaceably it might prevail; but he would rather surrender some portion of the truth than to disturb the peace of the world.

Still the Reformation kept on its way, and so far as Erasmus was concerned, unhindered and unhelped. Luther and the Lutherans exhausted exhortation and sarcasm upon him. The papists tried flatteries, promises, and solicitation. Princes tempted, kings offered honors, the pope himself condescended to urge him to return to full communion in the Church and array himself against the reform. When, after the insurrection of February, 1529, the papal religion was prohibited in Basle, and those who opposed the new doctrine were obliged to depart, Erasmus was among those who left, though he had already been condemned as a heretic by the College of the Sorbonne. He took up his residence at Fryburg, in the territory of Ferdinand of Austria. Still he tried to maintain his neutral ground; but was considered by the reformers a cowardly apostate, by papists a cowardly hypocrite. It grew harder and harder for the harassed old man to bury himself in books, when, blind himself as he might, he could not but feel the heart of the German people throbbing out the longing for the very religious liberty which he had taught them to desire and which his whole teaching had inspired.

And not the heart of Germany alone, but that of England, too, was in tumult, the nation that had drunk deepest of his discontent with the Church was preparing the martyr's death for More, his friend, the man whom of all men, perhaps, he loved the best. In France, too, the man who, perhaps, of all men loved him the best was hastening to his glorious death—Berquin, to whom when it came the blazing stake was like a chariot of fire on which his soul sped swift to God; Berquin, whose crime was that he translated and disseminated the proscribed writings of Erasmus. He did not wait for these blows to fall, but he must have felt them coming. Slowly, reluctantly, step by step, he had drawn near the arena. At first he praised Luther's work, then refused to condemn, then silently disapproved, then deplored his rashness aloud, then criticised his methods and motives, then gave sharp retaliation to his attacks, and finally, yet still reluctantly, entered the lists against him. The Church

knew the value of its ally; but the service he rendered in his diatribe on the "Freedom of the Will," while it served to define his own position, served little the cause of which he was now the avowed champion. It was like the old Erasmus in the elegant ease of its Latinity and the elaborate finish of its style, and also in the passionless argumentative treatment that showed it to be the work of the intellect alone. His heart was not in it. It did not fall upon an hour favorable to abstract theology or abstruse philosophy, but on an hour when the people were stirred at the very bottom of the heart.

Some one has said of this treatise that it was cool, smooth oil that only made the fire which Luther kindled in his reply, burn more fiercely. Sure it is that the heart-warm, but rough and sturdy eloquence of Luther robbed the argument of its power, and that Erasmus gained by it nothing in fame, and the papacy nothing in influence. So in this slow reluctant effort he was a disappointment to himself, a disappointment to the Church which he served without loving, and a disappointment to the reform which we believe he loved without serving. Of his service before the Reformation in tearing the veil and the fetters from the Scriptures, in exposing abuses in religion, too much can not be said. He won fairly the influence over the minds of the age, the homage of the great of all nations and the regard of the friends who, Romanist and Protestant alike, comforted his declining years. He gave those years to books, keeping up to the last his industrious habits; and in his favorite pursuits the sands of life ran lower, till he died, disregarding those administrations of religious devotion which he had so much derided in the monks, and fervently imploring the mercy of God through Jesus Christ.

His property was left to the poor, his grave was surrounded by students of every creed, his memory has come down to us of to-day as that of a gracious scholar, too gentle to be strong and who, when greatness came so near, that all men longed to see him grasp a crown, had not the courage to be great.

HAPPY ACCIDENTS.

IT is startling to observe in how many instances a great discovery seems to have hung upon a single thread. One little chance, one event in itself most trivial, and the invention might have been delayed for centuries before it would have presented itself to the mind of another.

I do not know a more curious book than one entitled "A Century of Inventions," published in 1645, by the Marquis of Worcester. It consists of descriptions of a hundred projects which resemble to a remarkable degree inventions which since have rendered men famous; and it is most tantalizing to be unable to discover how far the Marquis of Worcester had gone with the telegraph, with automaton figures, with machines for dredging harbors, with an endless watch which should never need winding, with cannon which should shoot six times in a minute, with flying machines, with lightning calculators, with revolvers, with steam-engines, and with many other projects which more fortunate men, as Watt and Stephenson and Morse, have linked with their names through time.

A brave man and a true one was this Marquis of Worcester, and like many another cavalier lost his all in fighting for Charles I, and received no recompense from the ingrate Charles II. There is an amusing story connected with one of his inventions at Raglan Castle, the incidents of which took place during the civil war. The marquis had built some hydraulic machinery for conveying water to the high tower of the castle, and, one day, observing some Roundheads approach, he gave orders to set the water-works, which moved with a great amount of noise, in motion. The marquis writing an account of it to a friend said: "There was such a roaring the poor, silly men

stood so amazed as if they had been half-dead, and yet they saw nothing. At last up comes one of my men, staring and running and crying as he came to them, 'Look to yourselves, my masters, for the lions are got loose.' Whereupon the Roundheads tumbled so over one another down the stairs, that it was thought half of them had broke their necks, never looking behind them till they were sure they were out of the reach of the beasts of prey!"

Many inventions are the slow growth of ages, while others spring instantly from the inventor's brain, the result of some happy accident, which relieves suffering humanity from some heavy load and sets an iron giant to perform the tiresome task. Watt's steam engine, which we are told advanced the world at one stride a thousand years, was the slow growth of time. It is generally acknowledged as far back as the time of Charles I, that our fun-loving Marquis of Worcester had made a model of a steam engine, but this was never utilized. Newcomen's engine was the first in which was combined a cylinder and piston with a separate boiler. The piston was driven by steam which was afterwards condensed by the application of cold water to the outside; but by a happy accident, a hole was made in the cylinder, which admitted the water to the inside, and it was found to work much better. But Newcomen's engine was only used for pumping water from mines, and was so very expensive, consuming such a quantity of coal that it was an open question whether horse-power was not cheaper in other than coal districts. It was at this critical time, one cool Sunday afternoon in the year 1765, in a stroll across Glasgow green, that Watt conquered nature by "finding out her weak side," conceived the idea of a separate condenser, which abolished the great waste of heat caused by the injection of cold water into the cylinder at every stroke, and utilized what, perhaps, had been lying loosely in his brain ever since his grandmother had given him, when a little boy, such a round scolding for playing with the tea-kettle, and for being such an idle good-for-nothing. Poor Watt seems always to have been the bane of womankind, and stood in the most deadly fear of his wife as well as of his grandmother. The poor fellow had a little garret fitted up as a workshop, and here he often cooked his own meals, as his wife had such a horror of his leathern apron and soiled hands, that it was necessary for him to go through with a lengthy cleansing process before he dared to present himself in her presence.

Among the accidental improvers of the steam-engine, was a fun-loving boy by the name of Humphrey Potter, whose duty it was to open the valves for the admission of steam. This youthful genius soon discovered that by uniting the valve by a string to another part of the machinery, the work would be better done and he have more time for bird's-nesting than he had hitherto enjoyed. This arrangement, rude as it was, continued till 1788, when Henry Beighton constructed an engine in which the valves were worked by a rod connected with the beam. Of poor Humphrey Potter, whose genius for fun combined with observation was so largely developed, we hear nothing further. This invention, though it has been of great importance to the world, brought him neither fame nor pelf, and took from him the only occupation he had (save that of bird's-nesting), so it is to be presumed he grew disgusted with inventing and devoted himself entirely to ornithological pursuits.

Another accidental improvement was the steam blast. As the engine puffed along and the engineer gazed anxiously down the iron track to see that all was right, the waste steam was constantly blowing in his face, preventing a clear view of the road, which was both unpleasant and dangerous. Somebody, it is not known who, said, "Let us send the steam up the chimney," and a new pipe was made connecting each cylinder with the smoke-stack. Before, bellows worked by the engine had always been necessary to keep up the fires; but to the great astonishment of the engineers, not only was the steam annoyance done away with, but the bellows were no longer needed. The hot steam being discharged into the comparatively cold chimney, a vacuum was produced, by the air which rushed through the furnace

to fill, and, of course, the faster the engine went the faster the steam was sent up the chimney, and the greater the draft through the furnace.

The cases of the discovery of the law of gravitation and of animal magnetism are too well known to need mention here; but one thing is forcibly brought to mind in the case of Sir Isaac Newton. Apples had been dropping to the ground since the world was made—at least according to the popular idea that the fruit which tempted Eve was an apple—but who had deduced from that fact any great law, or even given the matter a second thought? But here was Sir Isaac Newton, whose life was given up to study, whose relaxations were mechanical experiments and dabblings in ancient chronology, in whom the passions of other men, love, power, possessions, were totally absent, he, lying under the tree, the blue sky bending over him, still in his youth, only twenty-three, heard the twig snap, saw the apple leap to the earth, and the question which had been in his mind for months, Why does the moon go round the earth and the planets round the sun when it is natural for bodies in motion to go straight on? was answered, and the great discovery of the age made. It is the free, not the vacant, mind which discovers great truths, and if you are thinking upon any question, keep it before your mind, and suddenly a thing *happens*, as we say—something which has been taking place for ages, but it occurs for the first time for you, and your problem is solved.

It was a beautiful tribute to Newton from Pope, a just as well as a generous thing for him to say, that his life and manners would make as great a discovery of virtue, goodness, and rectitude of heart, as his works had done of penetration and the utmost stretch of human knowledge. And yet he was the man to exclaim, "I have gathered but a few shells upon the shores of time."

One day an honest man named Joshua Heilman sat in his little cottage in Alsace with his head upon his hand, thinking over his troubles, the greatest of which was his poverty. His daughters were many, while his dollars were few and hard to get, and the absorbing question was how to provide with food and clothing the dependent girls who were so dear to him. Upon this particular day he sat moodily watching them as they dressed their long, golden tresses, their only wealth. As they combed their yellow locks he noticed they drew the curling hair through their fingers and an idea flashed upon the lucky man. Why could not this process be imitated in dressing long staple (the long thread of wool, cotton, or flax), a commodity which had hitherto baffled all machinery? He acted upon the happy thought, and soon constructed a machine with a double action. By one the long fibers were combed out smoothly, by the other the comb was reversed and drew back the short threads. The machine was an entire success, and made the fortunes of both father and daughters.

Once there lived in the city of Haarlem an old gentleman by the name of Lawrence Coster, who kept the keys of the cathedral of that city. He was fond of taking a walk after dinner, and used often to indulge himself by going to a wood just without the city walls. One day, more than four hundred and fifty years ago, he went out as usual to take his after-dinner constitutional when, as he walked musingly along, he chanced to notice lying near him a very smooth piece of beech bark. Though the old gentleman was Dutch, he possessed all a Yankee's fancy for whittling, and upon this memorable walk he cut out upon the wood several letters. And he cut them so well that he was rather proud of them, and took the piece home, stamped the letters upon paper, and gave them to his son for a copy. After this he thought a good deal of this little circumstance. He cut more letters out of wood, and, covering them with ink, he stamped them upon paper, and after much work and much thinking, he finally stamped whole pages of letters, and so printing was invented. Poor old Lawrence Coster had little comfort from his discovery, as one of the apprentices, whom he found it necessary to hire, and upon whom he had enjoined great secrecy, and who, some people think, was John Gutenberg, ran off

with most of his wooden type and entire pages of a book he was about to print. The old gentleman's statue is upon the market-place at Haarlem, and some of his rough, dingy-looking old books, printed with very poor ink, are still to be seen in that city. There is no date attached to them, but antiquarians assign them to an earlier time than either Faust or Gutenberg, who generally have all the glory of the discovery of printing.

The time is a hundred years ago, and the scene a small bare cottage. A humble, illiterate weaver, awkwardly enough, has just overturned a common, one-thread, hand spinning-wheel—the only kind known. As it lies upon the floor, both wheel and spindle continue to revolve. A thought quick as inspiration darts upon him. It possessed his whole being in a second of time. Why can not a row of spindles be set side by side? Why can not one hand drive them all? Why can not some mechanical device let through just so much soft thread for each spindle, and so one spinner make eight, sixteen, thirty-two, any number of threads, as easily as one is made? The weaver thought about it for weeks and months. Doubtless his friends pitied him, and thought him half-daft; but he minded none of them, and his new idea possessed him and claimed him for its own. One day, as his sick wife lay in bed, he began marking upon the cottage with a burnt stick, as he was much in the habit of doing of late. He made the lines and curves with which he had grown so familiar over and over again. Suddenly he stopped to think, then quickly adding a line or two, he sprang to his feet, and to his wife's side, exclaiming, "I have it! I have it now!" and seizing her in his arms lifted her to the spot, while in hurried words and with excited manner, he explained to her the way that eight spindles could be run by the same wheel that had been turning only one. "We will call it 'spinning-jenny,' after thee, dear," he said; "they called thee spinning Jenny afore I had thee, because thou beat every lass in Stanhill Moor at the wheel. Yes, yes; it shall be called the spinning-jenny after thee." The new invention was indeed a great one, and any woman might have been proud to give it her name. It gave a wonderful impetus to cotton manufactures, and where before this industry had crept upon the few slow wheels, it now took wings and fairly flew. At the present day, a hundred and twelve years after the excited weaver lifted his sick wife from her bed to see what he had done, we have in many manufactories twenty-two hundred spindles all managed by one spinner. But poor Hargreaves made little by his grand invention. The weavers, supposing their trade was to be taken from them, raised riots, broke his machinery, and drove him from his home. It broke his heart, and he died. For the vast good he did the human race he has no recompense save that his name will never know oblivion, but will ever be mentioned among great inventors. Richard Arkwright took up his idea, improved upon it, and eventually became Sir Richard, giving employment to five thousand people in his mills, and finally died worth two or three millions of dollars.

The stocking loom was the result of a hasty love match which was made in 1589. William Lee was a bright fellow, and a Cambridge student, but like many another talented young man, he found his own love story much more interesting than those related by Virgil or Homer. His Greek and Latin and mathematics became secondary considerations, and most of his hours were spent with bright, bewitching little Peggy, the innkeeper's daughter, whose flashing eyes and floating curls claimed his admiration much more than the pompous, bewhiskered, bespectacled, stupid old dons of the college. Finally, one day, it was settled between them that it was too long for them to wait till the tedious course should be finished; so, in defiance of the university laws, instead of William Lee's stumbling through his Iliad, Peggy tied on her hat and they went together to the rectory and were married. The grave old dons were dreadfully indignant at this breech of the rules, and forthwith expelled the young lover, resolving to make such a dire example of him as to nip in the bud all love affairs in the future.

The poor young things were cast helpless upon the world with neither friends nor money, and with nothing but Peggy's knitting-needles to depend upon. Peggy was a famous knitter though, and she went bravely to work, while the poor young husband sat helplessly by, gazing at her with both love and despair gleaming in his eyes. One day, though, after he had been watching her nimble needles, with their cheerful click, very earnestly for a long time, it is said he suddenly exclaimed, "Eureka!" "Who?" asked poor Peggy, very anxiously. "It's found, dear; hurrah! I can do it better than you, and ever so much faster." He hastened off, purchased some wires, and after much patient work the stocking loom was an accomplished fact. Young Lee received no encouragement in England, but under the patronage of Henry IV and his great minister, Sully, his invention was introduced into France. Not until after Lee's death was the stocking loom brought before the English people, but it is interesting to know that there are now some fifty thousand looms (of course much improved since the young lover's time) in use in England, and in Nottinghamshire alone forty thousand people are employed in the manufacture of stockings.

The invention of envelopes is within the memory of middle-aged persons, and was the result of a Brighton stationer's endeavors to make his store look attractive. He took a fancy for ornamenting his show windows with high piles of paper, graduated from the largest to the smallest sizes in use, and to bring his pyramid to a point he cut card board into very minute squares. Ladies took these cards to be small sized note paper, and voted it "perfectly lovely." So great was the demand that the stationer found it desirable to cut paper to the size so much admired, but there was one difficulty. The little notes were so small when folded that there was no space for the address, so after some thought the idea of an envelope pierced the stationer's brain. He had them cut by a metal plate, and soon so great was the demand that he commissioned a dozen houses to manufacture them for him. From such small beginnings came this important branch of the stationery business.

Tinted paper was the result of the accidental dropping of a blueing-bag into one of the vats where paper was being made. The manufacturer, supposing the stationery ruined, stowed it in the warehouse for five years, and then sent it to London to be sold for whatever it would bring. Greatly to his surprise it sold exceedingly well. More of the same kind was ordered, and tinted paper became the fashion of the day.

It was said concerning our late Centennial Exposition that there was exhibited there but one entirely new invention. Have we lost our powers in that direction? Is Nature so poor as to have already given up all the treasures hidden in her dark recesses? As we stand upon the starry heights a hundred years from now, what will our eyes behold? The Atlantic bridged? The people of one hemisphere conversing with those of another through the telephone? The Keely motor a success?

WINTER'S HOPES.

THOUGH 'neath the Winter's dreary chill,
Faded and fall'n lie leaf and flower,
The root, unblighted, liveth still,
And bideth but its coming hour.

And when the first soft gale of Spring
Shall breathe upon that icy chain
All life and joy, the flower shall fling
New sweets and charms abroad again.

Then yield not thou to dark despair,
My heart, 'neath Fortune's bitterest frown;
Love's hope-fed flame yet gloweth there,
And memory still is all thine own.

Though sad and slow the hour the while,
O, doubt it not, 't will bring again
For every tear a brighter smile,
A dearer joy for every pain.

PHIDIAS AND HIS ART.*

EVERY BODY has heard of Phidias and his art, for is not his name a proverb in all the world? And yet comparatively little is known of his life and works. Detached notices here and broken fragments there—this is all we know and possess of that great genius of whom classical antiquity unanimously said: "He had no rival." Not even the dates of his birth and death can be determined with any degree of certainty. Nor is his father, Charmides, anywhere mentioned as his instructor, from which it is inferred that he was not an artist by profession, though being a member of a family that was related to the distinguished artists, the Daedalians, of Athens.

The genius of Phidias was early developed. When still a boy he exchanged the studio of Hegias, or Hegesias, his first master at Athens, for that of Ageladas, at Argos, the most celebrated sculptor of his time. It appears from data still extant, that at the time of the battle at Marathon, Phidias was about twenty-five years of age, and that he already then occupied a prominent position among his contemporary artists. For when the conquerors of Marathon devoted one-tenth of the spoils of war as a thank-offering to Pallas Athene for the purpose of erecting on the Acropolis a bronze statue in her honor, the Athenians chose him from among his numerous competitors to design and execute that work, a work of such colossal proportions and faultless symmetry as to challenge the wonder and admiration of the world for several succeeding centuries.

The life of Phidias embraces the period between the breaking out of the Greek-Persian wars and the beginning of the Hellenic civil war, known in history under the name of the Peloponnesian war (490–431 B. C.). But these fifty or sixty years form a period of purely human culture such as the history of the world has never witnessed before or since. The Greek-Persian wars ended in making Greece free and rich. The great victories won at Marathon, Salamis, and Platæa, and sung by poets, extolled by orators, and praised by historians, impressed, as it were, a threefold seal upon its charter of national independence and civil liberty, and saved Hellenic culture from the destructive influence of Oriental despotism. By these victories, to use Plutarch's fine expression, Grecian liberty became firmly established upon adamantine rocks. Within fifty years three men—Themistocles, Aristides, and Cimon—raised Athens to the first position among the Grecian states. Through Pericles it became "Hellas within Hellas." The name of Greece was lost in that of Athens. Its strong fortifications and powerful fleet gave it security, against foreign enemies, while the transfer within its limits of the federal treasury, the productive silver mines of the country, and its extensive trade and commerce with other nations, made it the abode of opulence, the center of culture and refinement, and the home of art, literature, and philosophy. But the republican traits in the character of the Athenians, intensifying their patriotism and enlarging their public-spiritedness, induced them to devote their large revenues to public purposes. Not splendid palaces and elegant villas were erected by and for its wealthy citizens, but temples, theaters, odeums, basilicas, and propylæa. The rivalry of great and wealthy party leaders contributed much towards the adornment of the city and the advancement of the fine arts. It was a noble ambition to devote one's wealth to the production of works which afforded pleasure to the citizens and enhanced the fame of the city. It is not to be supposed, however, that such liberality and public-spiritedness were the result of a demagogic desire to gain the applause of the multitudes and to control them by specious and deceitful arts. Cimon and Pericles were no more

*Torso: or, Art, Artists, and Art Works of Greek and Roman Antiquity. By Adolf Stahr. Second Improved Edition. Two Volumes. Pp. 642 and 558. Braunschweig: Fr. Vieweg & Son. 1878.

demagogues and tyrants, in the ordinary sense of these terms, than were the people of Athens, whose leaders they were both in the agora and on the battle-field. They were men of great minds and noble purposes, and planned and labored for the greatness and glory of Athens. It was, therefore, a pardonable pride in Pericles, when he caused the magnificent Odeum, built by his order from the wrecks of the conquered Persian fleet, to be constructed in imitation of the gorgeous tent, with its golden dome, from which the Persian monarch had once reviewed his (supposed) invincible fleet.

Indeed, the period of Grecian history in which Phidias lived is a remarkable one. National independence and civil liberty were now in the full possession of the Greeks. They had become conscious of the dignity and worth of their citizenship. As it is now the case in the United States, so it was in Greece;—every citizen had the right and the opportunity to be and to become and to develop into what there was in him, or for what he had a special aptitude; unhampered by oppressive laws and unannoyed by useless police regulations. Hence the fine arts flourished and were brought to unparalleled perfection. Mind and thought were free, their freedom having for the first time been asserted and maintained by the incomparable philosopher Anaxagoras. In poetry, Homer's grand epic, the Iliad, had become the common property of the Greek mind and furnished the foundation for its education, while sculptors and painters were embodying his gorgeous imagery in splendid visible forms. Lyric song was brought to perfection by Pindar, and the drama by Æschylus and Sophocles, while a perfect histrionic art furnished ideal forms to the plastic arts, and the latter again in their perfection influenced the former. In short, whatever tended to increase the greatness and fame of Athens, enhance intellectual culture, intensify æsthetic enjoyment, beautify life, and adorn society, was concentrated in that marble-glittering city. In addition to all this, a number of statesmen—Miltiades, Aristides, Themistocles, and Cimon—graced their country, whose names shine with luster on the pages of history; while the name and fame of the still more illustrious Pericles eclipse even theirs. To his genius as a statesman and art connoisseur are due the real greatness of Greece and the highest glory of Athens. He was among the people what Zeus was among the gods, and his contemporaries called him the "Olympian." It is upon this man we have to direct our attention for a while, before we are able to comprehend Phidias and his art.

Pericles was the descendant of an ancient noble family, or, as the Athenians expressed it, "a good one coming from good ones." His father had conquered the Persian fleet at Mykale, and his grandfather overthrown the power of the great Pisistratus, the ruler of Athens. Aged men saw in the physical and intellectual traits of young Pericles a striking resemblance to those of that great tyrant. The early years of his youth and manhood were spent in the military service of his country, in which he displayed great skill, courage, and bravery. But when Aristides was dead, Themistocles in exile, and Cimon in the camp in foreign countries, Pericles stepped forth and devoted himself to the advancement of the interests of the poor as against the rich and powerful oligarchs. Forty years he stood at the head of the republic, the greatest democrat among a pure democracy, and the foremost in the public councils, holding his power by no other means than by the greatness of his mind and the nobleness of his purposes and actions. The Athenians looked upon him as the realized ideal of the head of a free state. He was not only the wisest statesman and most successful general, but also the most accomplished orator of his day. Though never writing out his speeches and orations, "he poured forth," as one of his contemporaries said, "thunder and lightning from his lips and shook all Greece by his eloquence." Whatever was great and noble in the mind and character of the Greeks seemed to be concentrated in him. Pythoclides and Damon, the greatest masters of the muses, had been his tutors; while Anaxagoras and Zeno, the greatest thinkers and dialecticians of his age, were his com-

panions and counselors during his life. Possessing a highly cultivated sense for the true, the beautiful, and the good, he surrounded himself with persons of like tastes. He found in Phidias a true friend and a promoter of his great plans. As regards the varied accomplishments of his great mind and the tender qualities of his large heart, his untiring devotion to the interests of the state, and his keen relish for elevating amusements, his singular freedom from the religious superstitions of his age, and his temperance in eating and drinking, his severity towards evil-doers and his kindness to his friends and the poor, his noble conduct and uncompromising integrity, Pericles towers far above his contemporaries, so that even his rivals and enemies were compelled to pay homage to the greatness of his genius and the nobleness of his character.

Such was Pericles. As the champion of Hellenic liberty against the Persians and as the head of the Ionic Confederation he had made Athens politically the foremost city of Greece. And it was but natural that he should now turn his attention to its decoration, for it was politic that it should be adorned with a beauty equal to its prestige, and be the center of all that was glorious and beautiful in art, literature, and culture. Mention has already been made of the Odeum built by him to serve as a place for musical performances and the recitations of the rhapsodists. Other parts of the city he strengthened and beautified; but it was the Acropolis itself which witnessed the greatest splendors of his administration. Within its limited area arose buildings and statues on which the genius of Phidias and of other artists was employed for years. The colossal bronze statue erected by him to Pallas Athene has already been mentioned. A statue, the warlike appearance of which, according to Pausanias, gained for it the title of "Promachos" (champion), and the gleam of its helmet's plume and uplifted spear was hailed by the homeward-bound seamen as they doubled Cape Sunium.

But the national deity was to receive still greater honors at the hands of Pericles. He proceeded to rear, on the south side of the Acropolis, a magnificent temple to the virgin goddess known ever since by the name of "Parthenon." It was a masterpiece of architecture, completed in sixteen years, and stood upon the highest platform of the Acropolis, so that the pavement of the peristyle of the Parthenon was on a level with the capitals of the columns of the east portico of the Propylæum. It was built of white marble from the quarries of Mount Pentelicus. Within the outer portico, along the outside of the top of the wall of the building, ran a frieze three feet four inches in height, and five hundred and twenty feet in length, on which were sculptured figures in low relief, representing the Panthenaic procession. These splendid decorations were executed by Phidias. The marvelous beauty of these reliefs, which was heightened originally by color, has been long familiar to the world from numerous illustrated descriptions. The designer of the temple itself was not Phidias, but Ictinus.

Opposite to the Parthenon, on the northern edge of the Acropolis, Pericles reared another remarkable temple, smaller in size than the Parthenon, the "Erechtheum," built in the most graceful forms of the Ionic order, and in beautiful contrast with the severe sublimity of the Parthenon. Then came the construction of the "Propylæum," which, according to Pausanias, among the many glories of the Acropolis, was exceptionally magnificent. In felicity of execution this work rivaled the Parthenon, and in boldness and originality of design surpassed it. It was one of the most splendid of all the buildings of Pericles, and was completed in five years.

The magnificent works of art just mentioned are only a few among the many with which Athens was adorned by Pericles. Even Plutarch, who flourished about five hundred years subsequently, and who was by no means an art enthusiast, confessed that all the glories Rome possessed in ante-imperial times, could not be compared for a moment with the splendor and magnificence of the works of art that sprang into existence at Athens during the administration of Pericles. Nearly thirteen million dollars

were expended by him in the decoration of the city. On one occasion, when the people instigated by his political opponents, murmured against such extravagant expenditure of the public funds, Pericles thundered into their ears from the rostrum: "Well, then, I will assume all expenses myself, but I will set my name on all these offerings to our deities!" The Athenians struck by his high-mindness and liberality, and desiring to emulate his patriotism, exclaimed: "Take from the public treasury what is needed to carry out your great plans!" They showed themselves worthy of their great leader.

Only a genius recognizes a true genius. Thus Pericles discovered in Phidias a genius of the highest order—an architect, sculptor, painter, engraver, founder-in-bronze, gold and silver smith, carver in ivory, equally perfect in all these arts. Having chosen him in the first instance as his friend and confidential adviser, Pericles appointed him also general superintendent over the numberless artists and mechanics employed by the state, from architects and sculptors down to the carpenters and weavers. Phidias furnished them with plans, designs, or suggestions, as the case might be, for their respective works. Pericles's house was the rendezvous of the great artists and thinkers of Greece. Here were presented and discussed the plans and designs of those great works that were to adorn the city. Any differences of opinion were generally settled by an appeal to Pericles and Phidias, whose decisions were final. On the other hand, Phidias's studio was visited by Pericles and others to encourage him in the execution of his works and to make such suggestions as were deemed necessary for enhancing their beauty and symmetry. Nor is this all. The handsome young men and women of Athens sat willingly for him as models for his artistic creations. Only this co-operation of the highest and the best among the people of Hellas rendered it possible for the plastic arts to reach a degree of perfection never equaled before or since.

But there was another element necessary for their success and perfection, namely, *an appreciative public*, and *they had such a public.* The fine arts can not flourish unless they have an appreciative and patronizing public. The truth of this statement is confirmed by their history during the classic and Renaissance periods. Nor is their present state in Europe and America less corroborative; they require a communism in the best sense of the term—and this is the result of education. In Hellas the taste of the public for the fine arts was cultivated by state institutions as well as by the artists themselves, and thus the latter received in return vigorous impulses, fresh inspirations, and new suggestions. The masterpieces of Phidias and his numerous contemporary colleagues found their way not into the palaces and villas of the rich, but into the temples and theaters, the agoras and avenues, the groves and hills. The poor had as much a chance to see and enjoy them as the wealthy; they felt that they, too, had an ownership in them; hence they made themselves well acquainted with the lives, style, method, and peculiarities of the different artists. Art was considered a public affair, in which all alike were interested. Even the theater was a state institution. The poorest citizens were afforded an opportunity of becoming acquainted with the dramatic masterpieces of the poets of his country. While the rich, as a matter of honor, defrayed the expenses connected with "la mise en scène" of a drama, the state, under Pericles's administration, paid the entrance fee for the poor—about six cents a person. Equally free to the public were the musical and rhetorical contests, to say nothing of the performance in public of the various athletic games. It is, therefore, a matter of history that no people of ancient or modern times were such excellent connoisseurs of the fine arts as the ancient Greeks. True, they were, as a general thing, neither book-learned nor artistically polished; but from early youth they were being educated by seeing and hearing what was beautiful and sublime in nature and the fine arts. A lively sympathy for and acquaintance with artists and their works were thus engendered and developed in them, which prepared them to become intelligent and appreciative critics. Later on, the only approach to this

state of things was made by the Italians during the Middle Ages and the Renaissance period, during which the fine arts flourished and reached a high degree of perfection. Magnificent churches and splendid chapels, grand palaces and elegant council-halls arose on every side, filled with exquisite statuary and handsome paintings. But never did there exist such a universal community of interest in the fine arts as among the ancient Greeks. This could not but exercise a strong reflex influence upon the position and importance of the artists in social life. They were not regarded as eccentric persons—as is often the case in our days—to be tolerated only because of the amusement they may afford or the works they may have produced. The genius of Phidias, as an artist, and that of Pericles, as a statesman and art-patron, raised them to a position of equality with the highest and best in the public and social life of the Greeks. Art-schools conducted by great masters, like the schools of great philosophers, became centers of æsthetical culture and intellectual power, exercising a not inconsiderable influence upon the religious and political affairs of the state. The production of an art-work like Phidias' statue of Zeus, which, to use the expression of an ancient author, enhanced the sublimity of the worship of that god, was a great event in the religious history of the Greeks. The same was the case with Polyclet's statue of Juno, as with every other statue that represented an embodied ideal of a deity. The reason of this was the worship by the Greeks of ideal beauty embodied in art creations; and from this worship of the beautiful the artists received their inspiration.

Phidias, comprehending the Greek mind, by his art-creations satisfied its longing for the embodiment in visible forms of the ideal beauty with which it invested its deities. Zeus, the father and head of the Olympian gods, and Pallas Athene, his favorite daughter, and the goddess of manly wisdom and strength, are the poetic creations of Homer, whose ideal beauty Phidias embodied in visible forms—consummate masterpieces, or, as Mr. Stahr says, "the Iliad and Odyssey of plastic art." Nine statues of Pallas Athene proceeded from his hands, three of which were placed on the Acropolis. The first, Athene Promachos, mentioned before, was about sixty feet in height without the base, and, though placed between the Propylæum and the Parthenon, it towered above both. The second, called the "Lemnian Minerva," for the reason that the inhabitants of Lemnos ordered and presented it to Athens, though somewhat smaller in size, excelled the first in exquisite beauty, so that even Phidias considered it as his masterpiece. But the most celebrated of all his statues of Minerva was the one called "Athene Parthenos." Being designed for the Parthenon, it embodied the idea of the *virgin goddess*, as that of Athene Promachos did of the *warrior goddess*. It was placed in the *prodomus*, or front chamber of the temple, where, together with the temple itself, it was considered for centuries the pride and glory of Athens. It was formed of plates of ivory laid upon a core of wood or stone for the flesh parts, while the drapery, the shield, the ægis, the helmet, and other accessories were of solid gold, adorned with a world of exquisitely enchased designs, forms, and figures, the subjects of which were taken from Athenian legends. No expense was spared by the Athenians to make this statue worthy of the magnificent shrine in which it was to be placed; and it is said that when Phidias intimated his desire to execute it in marble, they directed him to use those materials which were the most costly. Pericles estimated the weight of the gold at forty-four talents, or in value about fifty thousand dollars. The whole was affixed to the statue in such a manner as to admit of its being removed like real drapery. Once, it is said, it was thus removed to be weighed again in order to clear the artist from the charge of having stolen a portion of the gold originally appropriated. In the time of Demetrius Poliorcetes, about 296 B. C., it was permanently removed from the statue by Lachares. Previous to the time of Phidias colossal statues, when not of bronze, were acroliths, the head, hands, and feet being of marble, while the body was of wood, concealed by real drapery; and the substitution

of ivory and gold for these materials is believed to have been his invention.* This great statue was finished in 438 B. C., and, with the Parthenon, was dedicated during the same year.

Shortly afterward the inhabitants of Elis—a district which by the common law of Greece was regarded as sacred on account of its possession of the temple of the Olympian Jupiter and of its being the seat of the most famous of the Greek games, and the quarternial scene of the most splendid Greek assemblages—invited Phidias to Olympia for the purpose of designing and executing a statue of their supreme deity for their temple. He was accompanied by numerous assistants, among whom were Colotes and Alcamenes, sculptors, and Panænus, a painter. In a sacred grove the Eleans built him a magnificent studio, which was still in existence at the time of Pausanias, a Greek traveler and topographer, about A. D. 150. Subsequently an altar was erected in it, and both were dedicated "to all the gods." Here Phidias and his assistants labored assiduously between four and five years before they succeeded in finishing that colossal chryselephantine statue which is known in art-history under name of the "Olympian Zeus." Pausanias, who has given a full description of it, relates that the god himself testified his approval of the sculptor's work by striking the pavement in front of it with lightning; and, according to Arrian, it was considered a calamity to die without having seen it. In the opinion of the different authors of antiquity who have written upon the subject, it was the great artist's masterpiece. The Eleans were so highly pleased with it that they granted him the honor of inscribing the following line upon its footstool: "Φειδίας Χάρμιδον υἱος Ἀθηναίος μ' ἐποιησεν—Phidias, the son of Charmides, the Athenian, made me."

Phidias, in this statue, represented Zeus as seated upon a throne of cedar-wood, holding in one hand an ivory and gold statue of Victory, and in the other a scepter, with his feet supported by a footstool, which, as well as every part of the throne and its base, was elaborately adorned with gold, ivory, ebony, and gems, with enchased work and paintings, with sculptures of precious metals, and with numerous accessory groups and bass-reliefs representing allegories and legends. "The idea," says P. Smith, "which Phidias essayed to embody in this, his greatest work, was that of the supreme deity of the Hellenic nation, no longer engaged in conflicts with the Titans and the giants, but having laid aside his thunderbolt, and enthroned as a conqueror, in perfect majesty and repose, ruling with a nod the subject world, and more especially presiding at the center of the Hellenic union over those games which were the expression of that religious and political union, and giving his blessing to those victories which were the highest honor that a Greek could gain. . . . Expression was given to this idea not only by the whole proportions and configuration of the statue, but more especially by the shape and position of the head. The height and expansive arch of the forehead, the masses of hair gently falling forward, the largeness of the facial angle, which exceeded ninety degrees, the shape of the eyebrows, the perfect calmness and commanding majesty of the large and full-opened eyes, the expressive repose of all the features, and the slight forward inclination of the head, are the chief elements that go to make up that representation which from the time of Phidias downward has been regarded as the

* For a full description of this wonderful statue the reader is referred to Mr. Stahr's excellent work (the title of which is given at the beginning of this article), Vol. I, pp. 176–180, to which we are indebted for much of the information contained in this article. In some of the subsequent pages of the book the reader will also find descriptions of five Minerva statues, exhumed at different times and places. From a minute examination of them it becomes evident that they are imitations, or copies, of some of Phidias's Minerva statues, executed by unknown sculptors of ancient Rome. The first of these—Pallas of Velletri, called so from the place where it was found—is preserved in the Louvre at Paris; the second—Minerva Chigi—in the gallery at Dresden; the third in the museum at Cassel; the fourth—Minerva Giustiniani—in the Vatican at Rome; the fifth in the Villa Albani. They are all of colossal size, and are said to be of exquisite workmanship. Another Minerva statue is found in the Hope Collection, London; another at Naples, and still another in the Villa Ludovisi, belonging to an Athenian. They are all worthy of careful study by art-students, especially young sculptors.

perfect ideal of supreme majesty and entire complacency of the 'father of gods and men' impersonated in a human form."

It appears, then, as if Zeus himself, in all his glory and majesty as pictured by the Greek imagination, had been sitting for Phidias as a model. A legend says that the Olympic god had appeared to him in a dream in exactly the form in which the artist produced his statue. The same was said of Onatas, after having executed his celebrated statue of Ceres for Phigalia, and of Parrhasios, after having finished a painting of Hercules. We find similar legends recorded of Raphael and other artists of the Christian art-period. The meaning of these legends is simply this: the glorification of the creative genius of great artists. Macrobius, however, reports that when Phidias was asked from what pattern he framed so divine a figure, he replied that it was from the archetype which he found in the following lines of Homer:

"He spoke, and awful bends his sable brows;
Shakes his ambrosial locks and gives the nod,
The stamp of fate, and sanction of the god;
High heav'n with trembling the dread signal took,
And all Olympus to the center shook"*

[*Homer's Iliad, Book I, lines 683–687—Pope's Translation.*]

"Revolving in his mind the ideal of Father Zeus as described in these lines, Phidias," as Cicero said, "gave free reign to his art and hand," and like Raphael, later on, in his thoughts and labors pursued a definite ideal as well as a definite idea.

For nearly eight hundred years this statue was the wonder and admiration of the ancient world. By a state decree its preservation was intrusted to the lineal descendants of Phidias. Even Caligula, the personification of meanness, malice, and vice, was deterred from transferring it to his palace at Rome for the purpose of taking off its head and placing his own in marble on its shoulders. When partially injured by lightning and despoiled of some of its ornaments, it was still an object of admiration to the Emperor Julian and his contemporary artists (A. D. 361–362). Theodosius II, it is said, caused it to be transferred to Byzantium, together with other works of Greek art, where they all perished in the great fire of A. D. 475.

Besides the colossal statues mentioned in the preceding pages, Phidias is said to have executed about twenty more, representing Juno and Venus, Apollo and Hermes, heroes and Amazons, to say nothing of many smaller ones. As an artist it was not his aim to produce statues representing merely human beings, but statues representing gods and goddesses in human form. "He was the first to break away from the stiff, archaic style of the earlier school of Greek sculptors, and to aim at pure and severe ideal beauty. He is said never to have imitated exactly any human model, however beautiful, nor do his works exhibit any of that sensuous grace which, in the productions of succeeding sculptors, tended to deprave the taste and to corrupt the art. Dignity, majesty, and repose were his distinguishing characteristics, and in no artist have they probably ever been united in so high a degree. He has been called 'the sculptor of the gods,' and his age 'the golden age of sculpture.'"

* For a full and interesting description of Phidias's Olympian Zeus we must again refer the reader and art-student to Dr. Stahr's work, Vol I, pp. 187–197. There they will also find descriptions of "Jupiter Atricoli" and "Jupiter Verospi;" both these statues are in Rome. A Greek sculptor residing in Italy executed them in Carrarian marble in imitation of Phidias's great statue. They are said to give the beholder an approximate idea of its magnificent head and bust. An image of it is also found on an ancient Greek coin, preserved in one of the collections of antiquities at Florence, pictorial representations of which are given in Overbeck's "History of the Greek Plastic Arts" and Lübke's "History of the Greek Plastic Arts." Art-students will find in Dr. Stahr's work full and interesting descriptions of all the works of plastic art of ancient Greece and Rome that have come down to us in a state either of entire or partial preservation. The author starts out with a description of the nature, country, and people of Greece; its gods; its connection with the Orient; then passes in review pre-Hellenic art; and describes the various periods of Greek plastic art, and the architectural and sculptural remains of that art wherever found; and then he passes in review the history of the plastic arts of ancient Rome down to the time of the Emperor Justinian, together with the remains of that art found in the various art collections of Europe. The whole work is the result of immense labor, extensive travels, and deep research. It contains a full description not only of the numerous works of plastic art of the countries which are referred to, but also of the lives and times of the different artists that produced them. No art library is complete without it, and no artist should fail to study it.

After the completion of the colossal statue of the Olympian Zeus, Phidias returned to Athens, honored by the warm friendship of Pericles, surrounded by numerous admiring art disciples, beloved by the people, and enjoying a happy old age. And yet he did not escape calumny and ingratitude. A formidable political party, led by one Cleon, a demagogue, aimed at the overthrow of Pericles. Fearing to attack the great statesman directly, they sought to undermine his influence by slandering and persecuting his friends—"*tout comme chez nous;*"—and Phidias, being his intimate friend, was accused by one Menon, a workman employed upon the Parthenon, of having stolen a portion of the gold appropriated to the chryselephantine statue of Pallas Athene. As the gold, however, had been affixed to the statue in such a manner as to admit of its removal, the accusers were challenged to substantiate their charge by weighing it, which they shrank from doing. Phidias, however, had it done, and thus triumphantly refuted the charge and established his honesty. Another charge, according to Plutarch, was then made against him of having introduced portraits of himself and Pericles in the bass-reliefs of the shield of Athene Parthenos representing the battles of the Amazons. As this act was supposed to imply a dishonor to the national religion, he was thrown into prison, where he died either by poison or by a natural death. But this entire story is regarded as suspicious in the extreme. No other ancient author mentions it. Plutarch, who lived about five hundred years after Phidias, mentions it only incidentally and in connection with the life of Pericles. It is known, however, that he drew his materials from sources inimical to Pericles. If it was really sacrilegious to use human models in subordinate positions on a grand work of art, it may be asserted with confidence that Phidias would not have committed such an act; but if he had, the portraits in question would, no doubt, have been effaced. There is, however, no record that such was the fact. Nor is it likely that the Athenians would have disgraced themselves by sentencing to imprisonment or death by poison one of their greatest men—now about eighty years of age—who by his great genius and splendid art creations had shed a luster over their city and country such as no other man ever did before or after him, except it be his intimate friend Pericles. Other slanderous charges were brought against him, but they all bear the stamp of falseness on their very faces. In all probability Phidias died a peaceful death, mourned by an admiring and grateful nation.

OLD STORIES ABOUT THE NEW WORLD.

IT is now the well settled opinion of the learned, that at some remote period the American continent was occupied by a rude race whose highest art was embodied in implements of stone. The weight of evidence points to Asia as their original home, whence they migrated eastward to our continent by way of Behring's Strait. A more cultivated race entered the country near Yucatan from a place called "Tulan" or "Tulopan," conquering the tribes whom they found in possession and being subdued themselves by a people known as the Aztecs. A careful scientific study of the monuments and picture-writings is demonstrating that the irruption from Tulan took place near the third century of the Christian era. Old beliefs on such points are gradually yielding, and it is becoming more and more evident that the Atlantic Ocean was the theater of nautical triumphs ages before the Northmen and Columbus. Yet at the end of the fourteenth century, the Arabic geographer, Ibn Khaldun, speaks of it as a sea upon which the sailor did not venture far, as there was no inhabited land beyond and the Atlantic was known as a "Sea of Darkness." The classic literature, nevertheless, brings forward topics of interest connected with the Western Ocean, the story of "Atlantis"

being one of the oldest of the stories about the New World.

Theopompus, in the third century B. C., preserved a fragment from Ælian, stating that beyond the then known world there was an island of continental size; but a century earlier, Plato, in his "Timæus and Critias," gave an account received by Solon from the Egyptian priests, according to which the island believed to be greater than both Asia and Africa had already been destroyed by a convulsion of nature. Before the catastrophe took place certain kings in the island combined and subdued the rest, next turning their attention to Europe and Africa. After many successes they were defeated by the Athenians, whose work was supplemented by an earthquake. In proof the priests added, "the sea is unnavigable at present, on account of the gradually impeding mud which the island produced." This is clearly a reference to "Sea of Saragossa," a region of the Atlantic, according to Humboldt, six times as large as Germany, filled with dense packs of weeds.

Three hundred years after Solon, Proclus visited Egypt, and was told the same story heard by Solon; while the Athenians, according to Brock, preserved a memorial of their victory upon a *peplum* carried in processions.

In considering narratives like these, many persons are influenced by the notion that the childhood of the world was all childishness, fancying that the mists which brooded over the earlier days were engendered of nothing instead of rising out of the great ocean of truth; yet, as time rolls on, supposed facts are often resolved into fiction, while the shadowy and obscure take on tangible and enduring forms. Plato's account of the lost island of Atlantis has often been subjected to a form of criticism that is itself beneath criticism by men anxious to be truly wise, rather than to seem to be so. Hence, when the subject of early transatlantic colonization is brought forward, it is treated with the irony of Imogen, who exclaimed,

> "Prithee, think
> There 's livers out of Britain,"

or, with the astonishment of the good woman in the White Mountains, who, upon being told by some tourists that their home was in Boston, threw up her hands and wondered that people should be able to live "so far away!"

It is, of course, too early to argue the historical character of Plato's narrative, yet it may be observed that there is no impossibility, or even improbability, respecting the main points. The groups of islands that strew the region once occupied, according to Plato, by a continent, may yet prove to be simply the memorials of a lost world. The invaders who came from Atlantis were, indeed, spoken of as giants, a common term for "mighty men;" but the fact that the people of Atlantis were called giants does not prove that there was no Atlantis, any more than the fact that the people of Patagonia are still believed by some to be giants proves that there never was any Patagonia. The question of "Atlantis" is one for the geologist, the linguist, and the ethnologist.

The first people positively known as navigators on the Atlantic were the Phœnicians. Homer calls them "men illustrious by sea," and Strabo observes that they studied "night sailing," otherwise, navigation by means of stars. Eleven hundred years before Christ they founded "Godir," the Spanish city of Cadiz, where they built large ships for the "exterior ocean." To the British Isles they resorted for tin, while unexplained mining operations in the West Indies point to their agency. The islands of the Atlantic appear to have afforded resting places in their secret expeditions. The Phœnician was the Englishman of antiquity, controlling the carrying trade of the nations and pushing his fortunes in distant portions of the habitable world. From them Homer must have known the "Isles of the Blest," though the Greeks learned of the establishment of the Phœnicians at Godir only by accident, when, in the seventh century before Christ, Colæus was blown to sea through the Straits of Gibraltar. Six hundred years before Christ the Phœnicians made the first authenticated voyage around Africa. As venturesome navigators, the Irish imitated the Phœnicians. Irish monks had

reached Iceland in 795, as proved from Dicesil, who wrote in 825.

The authenticity of the transatlantic voyages of the Northmen is now accepted almost unanimously, only an occasional writer opposing a mulish obstinacy to the educated intelligence of the world. From the tenth century to the time of Columbus Greenland was never forgotten, and in the "Ptolemy" of 1482, published at Ulm, the Genoese navigator saw Greenland laid down, though incorrectly, and given as an extension of Europe. The story of a voyage to America by Modoc and the Welshmen is to be taken with many qualifications, not because it involves any improbability, but because it lacks confirmation.

The authenticity of the Zeno voyage, however, must be conceded, for it is now well established that Nicolo Zeno, the Venetian, was wrecked in Frisland or the Faroe Islands in the year 1380, and thence reached Greenland and portions of America. The old objections to this voyage have been thoroughly dissipated.

Columbus was a late comer upon the scene. As a scientific man he possessed neither genius nor originality, drawing his nautical knowledge from D'Ailley and his (false) geography from Toscanelli, refusing to set out upon his voyage until his enormous demand for a tenth of the wealth to be won from India was allowed. When steering straight for South Carolina, supposing that his course led to Cathay, he was deflected from his route by some parrots, and by accident discovered the West Indies. In his second voyage, when near the western end of Cuba, he forced his officers to sign a declaration that Cuba was no island, but a part of the continent of Asia. Whoever denied this being liable to a fine of five thousand maravedos and to have his tongue cut out. (Navarrete. Vol. II. P. 145.)

When the existence of the American continent had been demonstrated, the Sea of Darkness did not at once become a sea of light. In addition to such well-known groups as the Azores and the Canaries, rumor would have it that the Atlantic was strewn with islands, certain of which appeared enchanted, while all played their part with the navigator in a geographical game of hide and seek. Some of these islands were laid down on maps prior to Columbus, and where, upon search, they could not be found. The general opinion was that they were the offspring of imagination. Amongst these islands was that called St. Brandon, in honor of an Irish saint, whose nautical adventures were curious. According to report, some time during the sixth century St. Brandon went forth in search of an island supposed to lie westward in the Atlantic, and came to one then called Ima, but afterwards "St. Brandon." In this island he found entombed the body of a giant, whom the saint restored to life, and from whom he learned that the Jews and pagans were disposed of in purgatory as they deserved. He, therefore, asked to be baptized; but at the end of fifteen days he found existence above ground a bore, and begged permission to die, a request that was granted after Mildun had done his best to pilot them to a neighboring island, with walls of crystal and burnished gold. St. Brandon, however, had time to say only a single mass on this wonderful island before it sank. Thus

> "From that dale forth the isle has beene
> By wandering sailors never sene:
> Some saye 't is buryed deepe
> Beneath the sea which breaks and roars
> Above its savage rocky shores,
> Nor e'er is knowne to sleepe."

A learned Portuguese writer thinks that, while it is contrary to reason to affirm the existence of this island, to deny it would be to suppose that many intelligent persons did not have the proper use of their senses, and thus between two stools the author of the "History of the Canary Islands" comes to the ground. Nevertheless, expeditions went in search of St. Brandon in 1526 and 1570, while in the next century the quest was renewed by De Acosta. Dominques also sailed for St. Brandon from Teneriffe in 1721, more than a hundred years later than De Acosta; while in 1759 the island was "seen" from Gomera on the "third day of May, at six o'clock in the morning," by a monk who, possibly, had not passed the night in his cell. At all events, he first

discovered the island with "two lofty mountains and a fertile valley between them." Father Fegjoo was skeptical, and suggested that it was the *Fata Morgana* of Sicily. The Isle de Fer in the Canaries is often reflected a long distance, and Viera held that under proper conditions the refracted air of those regions would enable one to see as far "as the Appalachian Mountains of Florida," thus suggesting a method by which the ancients may have discovered America. It is a curious fact that the reproduction of the above mentioned "Isle de Fer" was regarded as a veritable island, and so certain were those who saw it, that the Portuguese granted it to Louis Perdigon. This is why Father Fegjoo, after the style of Prospero, waves his wand and bids the vision of St. Brandon depart in company with those phantom ships that sailors see mysteriously sailing on under the arch of the sky:

"Fata Morgana, by thy potent spell
The sullen vapor weaves fantastic forms;
Isles float in beauty where the surges swell,
And golden cities break from dying storms;
Fair mountains tower round the sun-bright bays,
Arcadian beauties gem the verdant vale,
Earth, sky, and water glow with burnish'd rays
And notes of music wake the balmy gale:
While, dazed, the sailor steers with saddening eye
For ports and landmarks that before him ever fly."

The Island of the Seven Cities forms another curious subject, being referred to in the letter of Foscanelli to Columbus. Martani Behaine, who made a globe dated 1482, in one of the legends inscribed thereon, says that the seven cities which he laid down on the Tropic of Cancer, west of Teneriffe, were founded by an archbishop of Oporto, who fled thither in 734. He adds that a Spanish vessel came near the seven cities in 1414. Sailors also reported to Prince Henry the navigator, that they landed and found the people "good Catholics." What was still more to the point, the sand of the country was composed chiefly of gold. The English appear to have joined with other nations in the search for this wonderful island. In the year 1498 the Spanish envoy in England, who watched all the maritime enterprises of the country, wrote to his king that since the year 1491, the people of the city of Bristol had sent a number of ships annually to search for the Island of the Seven Cities. This was done at the instance of Cabot. Pasqualigo, an Italian resident in Spain, wrote home to Venice, in 1497, that Cabot, upon his return to Bristol, was received with the most joyous public demonstrations because he had actually discovered the "Seven Cities." The English annals, however, are silent. The existence of these islands was universally admitted, and Jehan Allefonse, the French navigator, near the year 1542, writes: "Southward, about three hundred leagues from Cape Breton, there is an island called the Seven Cities, forming one large island, and there are many people who have seen it besides myself, and can testify; but I do not know how things look in the interior, for I did not land on it."

We finally reach the island of "Antillia" (not to be confused with the ancient "Atlantis"), and which appeared in a map preserved at Weimar of the year 1405. It is placed in the Atlantic far to the west, though its name is not given. In 1436 it was laid down again by Andrea Bianco, being called "Antillia." The island was searched for many times, but was never found. Therefore, it has been concluded that Antillia was the offspring of the imagination, as was supposed with respect to St. Brandon and the Seven Cities. Geographers, however, may ultimately learn that the vast island known as Antillia represented a portion of the continent of America, which by the Cabots and many others was supposed to be formed simply of a collection of islands. When, however, the continent was somewhat solidified and found to be no part of Asia, another notion had to be met. It was long fondly held that a passage could be found extending into the Pacific, giving a clear course to the East. The maps of Verrazano show an isthmus in latitude 42° north only six miles wide. Cartier, in Canada, held that the great lakes furnished a route to India, while in 1542 Allefonse, a navigator yet destined to be known in America, thought that New England formed a part of Tartary. In 1524 Verrazano sought for a passage through, and Gomez followed him in 1525. In 1602 Champlain declared that

he would not return from Canada until he had discovered the route to China. In 1609 Henry Hudson searched the Hudson River for the same purpose, having been recommended to do so by Captain John Smith. In 1612 Champlain was still on the *qui vive* for the route to China; and a Frenchman, named Vignau, told him that he had seen the ocean at the west, where the wreck of an English ship lay upon the shore. He even volunteered to show Champlain the way. That intrepid adventurer at once set out, and it was only at the end of seventeen days of terrible trial and suffering that he discovered the fallacy. Vignau, with a blunderbuss at his head, confessed that the story was a device of his own, and he has generally been alluded to as an "impostor;" yet there is every reason to believe, while he had never seen what he described, that there were good reasons in his own mind for the existence of the sea, and that he simply intended to get the credit of being its discoverer. The Lachine Rapids on the St. Lawrence took their name from the fact that an early French missionary, when leaving that point for the interior, stood up in his canoe and waved his hand in that direction, saying, *à la Chine*—to China!

The English in Virginia were beset with the same dream. They believed that the shore of the Pacific lay just behind the present city of Richmond, and that the waves of that ocean sometimes broke over into the James River. The wise men composing the council at London had thought the matter over, and when the colonists went out they took with them a boat built in sections, with which they were to make the ascent of the James, and afterwards transport it over the hills and launch it in the sea. When the time came to make the experiment, Captain John Smith ridiculed the idea, but Captain Newport replied that Smith wished to discourage others in order that he might take up the exploration himself and cover his name with lasting glory. Accordingly Newport set forth upon his quest, in the end narrowly escaping starvation in the wilderness. Forty years later the distance from the head of the James to the Pacific was extended, and ten days was supposed to be the time required "for 50 foote and 30 horsemen" to reach the "happy shores" of the "peacefull Indian Sea." It is so laid down in a published map of 1651, sold in London at the "Sign of the Sun."

In this connection stands the "Strait of Arrian," which, according to a manuscript in the Ambrosian Library, was discovered in 1558 by one Maldonado. It was said to be in 75° north, connecting the Atlantic and the Pacific, and being about fifty miles long. The voyage through was described, and in a map the best places to erect fortifications were pointed out. The Spaniards believed in the strait, and in 1789 an expedition was charged with its rediscovery. This "geographical puzzle," so called, appears to have been a device arranged for the benefit of the Spaniards, and it antedated Frobisher's imagined discovery of a strait.

It will be perceived that some of these old stories concerning the Atlantic Ocean are formed of a mixture of truth and error. Yet even in cases where they appear the most fanciful, there are reasons to infer that they are based upon fact. Few persons in reading "Sinbad, the Sailor," suspect that the route pursued by the adventurer indicates courses known to old Arabic geographers. Hence they do not hesitate to class with stories of the "Arabian Nights" that found by Brington, which states that "St. Patrick sent missionaries to the islands of America." The Icelandic sagas, indeed, speak of a country in the Western Ocean called "Iceland the Great," but the unscientific methods taught in the average school secure little attention to the genesis of ideas. Hence the zeal and daring of the Irish monks and sailors, who performed marvels in wicker boats, goes for nothing. In time, perhaps, we shall come to believe that there were both ships and sailors before the days of Columbus.

It is by no means surprising that so many fanciful ideas prevailed respecting the islands lying in the Atlantic, since from time to time many new islands have appeared. On one occasion no less than seventeen rose from the sea near the Azores. At St. Michaels,

in 1810, an island was formed two miles in circumference and five hundred feet high, of which no trace remains. Allefonse tells of the "drowned isle," near the Sable Bank. This fishing bank itself, perhaps, is the wreck of an island once known to navigators. The same is probably true of the shoals of Nantucket. Webb's island, off Cape Cod, once resorted to by the people of Nantucket for wood, has disappeared, its place being occupied by deep water. Thus islands come and go, while the old map makers were never backward about making changes, but changed both the real and imaginary isles from place to place as the chess-player moves knights and castles. Such has been the fate of Crusoe's Isle. The original edition of De Foe's immortal work, published in 1719, describes the adventures of one "who lived eight and twenty years all alone in an uninhabited island on the Coast of America, near the mouth of the Great River of Oroonoque." Nevertheless, popular opinion will have it that De Foe intended to write about Juan Fernandez, in the Pacific. With the best of reasons, however, many Shakespearean scholars teach that the Bard of Avon had in mind the Bermudas when he composed that grand creation of his ripened imagination, "The Tempest." There are more things in the play than are dreamed of in Bermuda, but this does not prove that Shakespeare knew nothing about Bermuda, any more than the exaggerations of Timæus and Crito, respecting Atlantis, prove that Plato and the Egyptian priests knew nothing about a continent at the west in the Atlantic.

These old stories were based upon an early knowledge of the fact that another world, otherwise "much continent," existed far away in the sea. Atlantis, Antillia, and the Isles of the Seven Cities were reminiscences of early discoveries. The fact that these places were called "islands" does not make against this view. Strabo said, "Perception and experience alike inform us that the earth we inhabit is an island." In the early ages the term was applied to almost any region reached by water. The coasts of Asia Minor and Greece were known as the "Isles of Elishah," famous for "blue and purple;" and Isaiah says, "I will make the rivers islands," that is, dry and barren places. Cabot, as noted, held that America was simply a collection of islands. Fables were mixed with truth, but that was to be expected. The same is the case to-day, and in each case it is our duty to consider the probabilities.

THE SQUIRE.

MANY years ago I was one of a picnic party driven by a sudden storm to seek shelter in the hotel of the village of Woodbridge. The storm continuing, supper was served us in the long dining-room with bare floor scrubbed to marvelous whiteness. Among those who besides ourselves surrounded the table was an individual who especially attracted our notice. He was a spare gentleman of middle age, dressed in rusty black, but with scrupulous neatness, and his glossy black hair just sprinkled with white was arranged with great nicety. He kept his eyes fixed upon his plate evidently regardless of all that was taking place about him. If addressed he seemed to undergo almost a paroxysm, his eyelids twitched, a tremor ran through his frame, he grasped his knife and fork, dropped them again, moved his saucer, then his cup, then his salt-cellar; it was not until after several minutes that he regained composure. We were young and light-headed and ready to find a frolic in any thing or nothing, and so several of the young gentlemen in their gravest tones made of him numerous inquiries concerning the town, its size, its business, and the like, to which he responded in the briefest manner possible, but always with the same contortions, the rest of us meanwhile choking down our mirth as best we could. He left the table, at last, long before any one

else, evidently unable to endure the strain longer. After our return to the sitting-room, and on our homeward ride, we made merry at his expense; one of the young gentlemen being an admirable mimic, personated the quivering unknown, as we dubbed him, and we re-acted the supper scene, rallying the young lady who had happened to sit next him as being the probable cause of his embarrassment.

Years passed on. Fortune cast me thousands of miles from Woodbridge, and also separated me far enough from the bouyancy of youth. Twenty years after my first visit, wherefore does not concern the interests of this story, it was my lot to pass the months of one Summer in the same hotel where I had stopped by chance so long before. The village seemed exactly as I remembered it; I could hardly repress a sigh to think that nothing had changed except myself. It was a wonderfully fresh little town. It seemed to me that never before had I seen the grass so green or the flowers so bright; the houses all modeled very much alike had a clean, trim look; but except its extreme neatness there was nothing striking about it. It was situated in a valley walled in by high green hills, and was scarcely ever called Woodbridge by the dwellers upon these hills, but known unpoetically enough as "The Flat."

The church and grave-yard had a peculiar interest for me. The latter was not at some distance from the town, as is often the case, but close to the church which stood in the center of the village. It was originally on the outskirts, and it was not expected that the village would grow in that direction, they told me. However, there it lay a constant reminder to the inhabitants of "the house appointed for all living;" and whoever looked down upon the white spire of the church and the white homes of the living, looked also upon the white tablets of the dead. I noticed that some precise people of the place were careful to say cemetery, but I thought it a misnomer. Cemetery appears to me adapted to a stately city of the dead with winding avenues and lofty monuments; but for a place like this, where the tomb itself and not its surroundings was the chief object of contemplation, and the graves so close together that you unwittingly trod upon them, grave-yard seems much more appropriate.

The church was quite old as we reckon age in this new country of ours—at least the young people thought so and were clamorous for another; but the older and the moneyed portion of the congregation seemed very well content. I thought its old fashion a great charm. I used to think, as I looked upon the young girls in the choir, that probably their grandmothers as fair and hopeful had sat in the same seats and sung the same tunes and looked out through the narrow-paned windows where now the sunshine was falling upon their own graves; and how brief a time it would be before these too would be gathered to the generations that had gone before them. Such reflections used to wind like a commentary in and out among the words that floated down from the pulpit: "We spend our years as a tale that is told. . . . So teach us to number our days that we may apply our hearts unto wisdom."

But these matters I learned gradually. I was more than surprised on sitting down to supper the first night of my arrival to see the same gentleman opposite who had so provoked our unseemly mirth twenty years before. I had hardly thought of him since; but there was no doubt but that it was the same, the nervous gestures were unaltered, though the face was older and thinner and the hair considerably whitened. I asked Mrs. Fellows, the landlady, when she came into my room that night, if that elderly gentleman had boarded there long.

"Oh! the Squire, you mean," she said. "Mr. Laselle he is, but he is known all round these parts as 'the Squire;' la, yes, towards thirty years, I believe. I've been here eighteen of it myself. I presume you noticed, ma'am, how kind of fidgety-like he is, but that's his way; he's a good kind soul as ever was, never makes no trouble."

"Is his health poor?" I asked.

"No, I guess not," she rejoined. "He never makes no complaint. Some folks think he must have been love-cracked some time or

other, but nobody knows nothing of it, and I doubt it; he is too shy of men, and women too, for that. I think likely he had fits when he was little. My sister had a child that used to go into spasms, and I declare if it don't call up that poor young one sometimes when I see the Squire. That only lived, though, to be three years old, and every body thought it was a mercy when it died."

"Has he a business?" I inquired again, not unwilling to break the thread of her discourse.

"Yes, a store, though I guess he don't sell much; don't make stir enough, and they get all the custom across the way. He goes and sits there all day, just the same, though. I've been told he used to own the place upon the hill that you can see from your window. He has a sister, who comes to see him every Summer; but she is no more like him than nothing," and my voluble informant, suddenly bethinking herself of the bread she must "put to sponge," bustled away.

For some reason or other, possibly because I felt conscience-stricken to remember how we in our youthful folly had annoyed him, or perhaps because, as I have before hinted, I had not since then "fed on the roses or lain in the lilies of life," and so was quickened into sympathy with all suffering, I came to take a strange interest in this lonely man. Several weeks passed by. My acquaintance with him did not advance. At first, I had ventured a friendly "Good morning," but this was evidently so distressing that I left it off, and so day after day he sat silent as a statue. He went regularly to his store, and to church on Sunday. No one seemed to think any thing of his singular manners. They had long been accustomed to them; "it was the Squire's way." It was said that at rare intervals, generally after a severe rebuke from the pastor to those members of his flock who failed to find a voice in the prayer-meetings, the Squire would rise to his feet and begin to pray, at first stammering painfully with all his usual embarrassment; but gradually seeming to forget every thing about him, he would pour out his soul in an appeal so fervent and touching that devout hearts were lifted up by its remembrance for weeks after; as one lady said: "To hear the Squire's prayers is like reading the Psalms; what you want to say to God is said for you as though he were looking into your very heart."

Sometimes I questioned whether it were remorse or grief that had shattered his system, and wondered what secret crime he could have committed, or what terrible sorrow could have so blighted his life. One morning he did not appear at the breakfast table, and Mrs. Fellows went to his room to ascertain the meaning of so unusual an occurrence. She came down, her eyes wide open and face white with terror, "Oh, he's dead in his bed!" she gasped. It was true; the doctor was instantly summoned and pronounced that he had died several hours before, in his judgment, from heart disease. Later I went in to look at him. His face was peaceful. Neither word nor look disturbed it now. His secret, if he had one, throbbed no longer beneath the breast over which the hands were calmly folded. "And to think," said kind-hearted Mrs. Fellows, wiping her eyes on the corner of her apron, "that the poor soul should ha' died alone, and the rest of us sleeping sound and never knowing. I always ha' said that if he was ever sick, I'd nurse him like my own brother;—never making no trouble, and paying his board regular every week."

A telegram had been immediately sent to Mrs. Belmont, the Squire's sister, living in Newark, and an answering dispatch had directed that the funeral should be postponed until her arrival. She came the next evening, a sweet-faced woman in widow's weeds, considerably younger than her brother. She wept much at the sight of the placid face, saying over and over, "Poor Phil!" The funeral was held, according to custom, in the church of which he had been a member many years. The discourse was an indifferent one and seemed unfeeling; but the choir sang "Asleep in Jesus," and I remember thinking that one need wish for nothing more. After the services the congregation straggled past the coffin to look on the face of one

whom most of them had always known; the glances which they bestowed were indifferent or curious, evidently he had held himself aloof too much from society to have any hold upon it. Some women in shabby clothes were exceptions; they lingered long, shedding many tears. A lady in the pew with me remarked that the Squire had always been very kind to the poor, giving away, no one knew how much, every year; that they would be likely to miss him if no one else did.

After the funeral, the will was read in the hotel parlor. There were several bequests; one to Mrs. Fellows, which caused her to throw up her hands and wipe her eyes in a truly tragic manner; but the bulk of his property—quite a fortune—was equally divided between Margaret Laselle Belmont and Catherine Fielding Stone.

"You know the joint heir with yourself, Mrs. Belmont?" said the lawyer.

"Certainly," was the reply; "she is a resident of Newark." But no one else seemed to know her, and I heard much speculation on the subject from Mrs. Fellows, who reported that not even the oldest inhabitant knew any Stones or Fieldings. I judged from her conversation that she had also sounded Mrs. Belmont upon the matter, but without obtaining the coveted information.

Mrs. Belmont remained several weeks in Woodbridge until her brother's affairs could be settled. Quite an intimacy sprang up between us, owing largely to the fact that she was a frank, social woman, and the friends of her youth had either died or removed. So it happened that, one day after we had driven past the home of her childhood, she told me the story of her brother's life. The Laselle homestead was a tall, narrow house, with high chimneys built of stone, the gray tint of which blended well with the landscape; there was a row of dying poplars along the roadside; the front yard was crowded with evergreens and lilac bushes, long untrimmed, which gave to the premises a funereal look. The lilacs were in blossom when we drove by, and nodded their purple plumes, wafting to us their subtle perfume; since then the sight or odor of lilacs always gives me a feeling of sadness; they seem dedicated to the dead like the weeping willow and the cypress.

Many years before, Hugh Laselle, a stern, taciturn man of thirty-five or thereabouts, had lived here; he had little intercourse with his neighbors, and apparently wished for less. In the next house an orphan of seventeen, a shy, shrinking girl, lived with an uncle; she was heir by her father's will to a large property, which her uncle thought by right belonged to himself, and her life was far from happy. Her fertile meadows adjoined those of Hugh Laselle, and he was thought to have looked upon them with covetous eyes, avarice being one of his leading characteristics; however that may have been, he wooed this timid girl, wedded her, and brought her to live in the old stone house. People seldom saw her after her marriage, but those who did remarked her pitiful, frightened look, like that seen in the eyes of a hunted deer. Two years from the day that she was a bride she lay dead in the gloomy parlor, and her stern husband shed no tear, or otherwise made sign of grief, but sitting rigidly in the room across the hall, chided sharply the nurse because she could not hush the week-old baby, that wailed as though conscious of its loss. An old woman, almost as stern and silent as her master, was secured as housekeeper, and in such companionship the early years of little Philemon Laselle were passed. His young mother had bequeathed to him the sad heritage of her timid nature. From infancy he seemed to shrink in mortal terror from his father, and this fact prevented what little tenderness there might have been in the heart of the stern man from manifesting itself. Living in so secluded a manner, he grew to almost fear the face of man. When old enough he was sent to school, where his nervous, frightened ways were taken as evidence that he was lacking in ordinary intelligence, and the expressions "half-witted," "Laselle's fool," from unfeeling lips fell upon his sensitive ear. He played truant for many a day, wandering in the fields and woods, where the birds and flowers had only tender utterances

for him; but this coming to the knowledge of his father, who had no more appreciation of the boy's feelings than a hawk could be expected to have for those of a turtle-dove, regarding it as rebellion against lawful authority, he beat him severely, thus securing for the future his presence in the schoolroom, where he made commendable progress in every thing except happiness. When he was fourteen years old there came a great change in his life, which, had it come a dozen years earlier, might have been his salvation. Hugh Luselle married again. The lady of his choice was a very different person from his dead wife; a brisk, warm-hearted woman whose merry manners covered a very resolute spirit. People shook their heads, and said that "Mirandy" Warner would do well to remember the fate of poor Mary Sears. But it is a noticeable fact that in no stratum of society has there been known to exist a man so disagreeable, brutal, alas! vicious, but that some woman, very frequently a worthy woman too, has been found willing to unite her fate with his. It can not be denied that this is against the sex, and it is to be hoped that in the new dispensation for women there will be a radical reformation in this respect.

Miranda Warner was not as young as she once had been; she was a poor tailoress, who sewed from house to house. A needle is hardly equal to making provision for old age; she preferred a home of her home, even with the drawback of a husband. Probably, too, she felt herself capable of managing him. Whether remorse had gnawed a little all these years at Hugh Luselle's tough heart, or whether a strong nature was able to thwart his inclination to tyrannize, was not known, but it was certain that Miranda's face was as merry as ever, that she had occasional tea-drinkings in the old house, and that her husband actually appeared at church with her the Sunday following her marriage and at rare seasons afterwards, which was something so unprecedented that it kept all Woodbridge in a ferment for at least a week. But to the lonely boy she was indeed a ministering angel. To him she brought a wealth of pity which ripened into love. Diligently she worked and patiently she waited to gain entrance to a heart at which no human being had ever knocked before, and though she was repelled long, at last she was admitted, and Philemon ever after rendered her an affection almost idolatrous. Gradually his shyness became imperceptible at home except in the presence of his father, though he never went out except to accompany his step-mother to church.

When a baby sister was given him he seemed to cherish her with a tenderness and devotion more like that of a mother than a a boy of sixteen. He never wearied of holding her, of talking to her, and as she grew older the slightest wish of the little creature was to him as law. When Maggie was five years old their father was kicked by a horse so violently that he died a few hours after. If ever kind things are said concerning a man it is over his coffin, but conversation seemed to turn almost wholly upon the living.

"Mirandy" had not made such a bad bargain, after all, as things had turned out, and she might take a sight o' comfort now if she and Philemon could manage to run the farm. "Take comfort" they certainly seemed to; Philemon, though he never sought enjoyment or companionship away from home, almost lost his startled ways, and the farm seemed to be "run" as well as ever. There were some innovations and extravagances, however, that the neighbors thought must make the avaricious Hugh Luselle turn in his grave. The house, which had had only the most meager appointments, was handsomely furnished, and a piano, the first in the town, was brought over the hills for the little Maggie. As has before been stated, Philemon was a most loyal knight for this dainty lady. He scarcely knew that he could sing until she coaxed him to accompany her. For her he made flower-beds and put up swings, told stories, and helped her in her lessons. As she grew older she beguiled him into acting as her escort to many places where he would never have consented to go for any other's asking.

Finally, after many refusals, by dint of much urging and a few tears, still more

effective, she succeeded in getting his consent to attend a Winter singing-school. He was thirty, and the Woodbridge girls had never before noticed what a handsome fellow Phil Laselle was, and began to regard him in the current parlance as "quite a catch." The following Winter pretty Maggie would not have been obliged to depend on the kind offices of her grave brother, for she was a great favorite. But her mother pronounced her too young for such things, and that if Phil could not take her she must be content to remain at home; so there was no help for it, and Phil was enlisted for another Winter. It was during these days that Philemon received the sobriquet of "Squire," which clung to him through life, as sometimes happens. It was given him by the young people, good-humoredly enough, on account of his staid demeanor.

But all earthly happiness is uncertain. It seemed very terrible and mysterious to Philemon and Maggie when the Death Angel again entered their home and claimed their mother as his prey. "So sad! every thing to live for!" people murmured as they heard that she had been summoned. She died intrusting with her last breath her child to the guardianship of Philemon. But young hearts recover quickly, even from heavy blows, and Maggie rallied sooner than her brother, whose heart bled long over the grave of the first friend he had ever known. His love for Maggie could not increase, but now it was coupled with a tender solicitude. He became convinced that she must have better educational advantages than Woodbridge afforded, and after careful inquiry at length fixed upon a boarding-school, to which he sent her for three years.

It was a sore trial for him to part with her, but her letters showed her to be happy, and her vacations brought her home affectionate and unspoiled; but it was not well for him to have her away, for he sank into the hermit way of life which was only too natural to him. Nothing would do but that Phil must come down and see her graduated, in all the glory of white muslin and blue-ribboned essay. It had been arranged that her dearest friend, Kate Fielding, of New York, should accompany her home to spend a few weeks, and that Maggie should return the visit the following Winter. Kate Fielding was a sparkling, warm-hearted girl. Of course, being so intimate with Maggie, she could not help hearing much of Philemon, and was prepared to regard him very much as his sister did. Thirty-five seems an almost infinite distance from nineteen, and he might have been fifty from any indications of youth in his manners. She was delighted with every thing in the country, and treated him with an engaging familiarity, unconscious of the mischief that she was working. Shy and unsophisticated as a boy of sixteen, her hand kindled the fires of love in his heart, where they burned secretly, unsuspected even by his sister. She sat in the singers' seat with Maggie. It was the custom in those days to face the choir during the singing, and he used to gaze upward on her face with the rapt look that the Romish devotee gives to a picture of "Our Lady."

It was in vain that the damsels of Woodbridge cast upon him languishing glances. He had no eyes for them. Kate went home; the fire burned steadily on her shrine, fed by all the forces of his nature. She wrote weekly letters to Maggie, always sending gay, friendly messages to Phil. She came up for a week early in the season the following year. The night of her arrival she and Philemon were out on the piazza as the sun was going down. Nature was at her best, with the freshness of Spring and the completeness of Summer. Far off, the hills lay blue and peaceful; nearer, the slopes were covered with velvety turf, the orchards were white with blossoms, the air was laden with the perfumes of lilacs, and over all the sun was casting his good night glory.

Kate stood drinking it all in, her face radiant. "One could stay in this lovely spot always," she said. The flame that had burned in Philemon Laselle's heart a year, leaped suddenly to his lips. "Do stay always, Kate," he said, his voice trembling with his great yearning. Had it been any other man, perhaps if she had glanced at him, she would have understood his mean-

ing; but her gaze was riveted upon the hills, and, indeed, she would have as soon expected a declaration of love from her own father. "I suppose there is somebody who would have a word to say about that," she laughed, and then flushing prettily, "O Phil! I have something to ask you; I am going to be married in the Fall. I waited until I could see Maggie, to tell her. We have been talking it all over this afternoon, and she has promised to be my brides-maid, if you are willing. Say she can come, won't you Phil? that's a good fellow. I could not be married without her."

Philemon, with his hand to his face, as if to shade it from the sun, managed to articulate something that she took for consent, and Maggie coming out presently, their talk flowed on—a girlish babble that would have been music to his ears but yesterday, but was now keen torture. They were so absorbed in themselves that they did not notice that Philemon was silent, even beyond his wont, and he was grateful for the kindly darkness which soon settled down and hid his face from them. All that night he strode up and down among the lilacs. For him the sun and stars were blotted out forever, so far as this life was concerned, and he knew it.

"I happened to come down very early the next morning," said Mrs. Belmont,—"and opening the front door I found Phil on the piazza with his face in his hands; his clothes were drenched with dew, and as he lifted his face I was positively frightened, it was so pinched and haggard. "Oh, Phil, Phil! what is it?" I cried. "Oh nothing, nothing!" he answered, trying to smile, but he shivered. "I know you must be sick," I went on confusedly. "Come into the house, and let me send for a doctor and call Kate." "Not her," he said hoarsely, seizing my arm with such a grip that I bore the marks of his fingers for weeks. "Not her," and turning he strode off into the fields. The truth flashed upon me, and I had hard work to conceal my feelings from Kate. We hardly saw any thing of Phil during the rest of the time that she stayed. "So busy," he said, but she was too much taken up in her own happiness to notice any thing strange in either of us.

The night after she went away, I crept into Phil's arms, and made him tell me about it. I thought perhaps it might relieve him, but he made me promise solemnly that I would never mention it to her. "Poor Phil!" she said, smiling, though the tears stood in her eyes; "he knew less of the art of love-making than Captain Miles Standish. It might have been, I have thought sometimes, if he had but known how to woo, if he had shown her before that he loved her, for I think it was but a girlish fancy that she had for the man she married."

"And you think she never suspected his attachment?" I asked.

"O, I am sure of it. He never saw her face afterward, and I rarely mentioned her name to him. The wound never healed, and I knew it but made it bleed afresh. Poor Kate! her husband proved to be a worthless, dissipated fellow, and she has had a hard struggle with poverty and shame. She has told me many times of receiving sums of money in an anonymous manner and wondering who could have sent them. I knew it must have been Phil. I was married a year or two after Kate," she went on. "Sometimes I have thought I was selfish ever to have left him; but my plans for his happiness all came to grief. I never doubted but that I could coax him to come and live with me; but it was the only thing in all my life that Phil ever refused me. My husband had a brother, a wild young fellow, who was fast going to ruin, and we thought if we could get him away from the city and bad associations it might save him. He had no taste for farming, and we persuaded Phil to sell the old homestead and go into business with him in Woodbridge. We thought if he were obliged to mingle more freely with his fellow men, it would be better for him than living that secluded life on the farm. It was much against his inclination that he consented, and we never could have had the heart to urge the matter if we had not believed we were acting for his good, and I am certain we should have failed if it had not been for his spirit of self-sacrifice; for we really

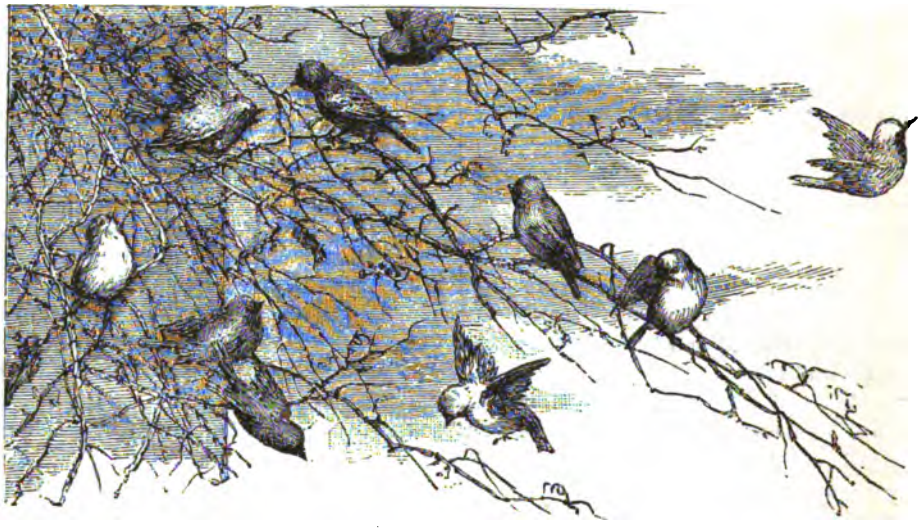
felt that it would be the salvation of Henry, and I believe it was. There was a great change in him, and the two were warm friends, widely as they differed. We hoped that, after a few years, when Henry had become firmly established in a steady life, that the partners would remove near us; but in three years Henry died, and we never could prevail on Phil to make any change, not even to visit us. It is a crooked world," she concluded, sighing. "I never could understand why his life was blighted so."

Mrs. Belmont left Woodbridge a few days later, and in a few weeks I, too, bade farewell to the quiet nook among the hills, never probably to revisit it. The day before I left I went into the grave-yard and stood beside the grave of the one whose sad story had so interested me. Beneath the record of his birth and death were the lines—odd, indeed, for a tombstone, but doubtless his sister's solace in regard to the "crooked world:"—

"God is his own interpreter,
And he will make it plain."

The western sun lit up the polished marble with dazzling brightness, and the living words made the tablet seem not so much a memorial of the shrinking, suffering, earthly tabernacle as of the freed spirit ushered into "the glorious liberty of the children of God."

SWEET BIRDS.



SWEET birds, that breathe the spirit of song,
And surround heaven's gate in melodious throng,
Who rise with the earliest beams of day,
Your morning tribute of thanks to pay,—
Ye remind us that we should likewise raise
The voice of devotion, and songs of praise;
There is something about ye that points on high,
Ye beautiful tenants of earth and sky!

DE PROFUNDIS VIA CRUCIS.

I. PRELUDE.

OUT of the depths by the way of the cross!—
I mused on man's grandeur, his ruin and loss,
That problem of evil all ages have pondered,—
Saints trusted with awe,—sages questioned and wondered.

I mused till the anguish of millions was mine;
Prayed, wrestled, and groped for the secret divine;
Debated with schoolmen, vexed science and seers,
Then bowed, like blind Samson, in fetters and tears.

II. THE PROBLEM OF THE AGES.

What is it to be? What is it to be?
Forever to drift o'er a limitless sea,
Lost in a trackless and infinite haze
Of glories that dazzle and doubts that amaze?

O, what is existence? How awful! How dread!
My soul shrinks appalled, and I cover my head,
As being's vast mystery looms on my thought,
Eternal, avoidless, unshunned, and unsought.

I scarce had dared ask so tremendous a dower;
'T is mine, by the fiat of infinite Power:
I tremble; 't is on me; I can not expire,
Nor 'scape from existence,—nor dare I desire.

No wrong had been done had my soul never been;
No joy had I lost, and committed no sin;
No Paradise forfeited, vengeance incurred,
No excellence blasted, nor holiness blurred.

But O, to go back into nothing again,
To a soul that has been, were more awful than pain!
To be blotted from being, engulfed in the void,
Were worse than despair of a heaven once enjoyed!

I start back aghast from oblivion's verge
But to writhe on barbed sorrows, like lances that urge
My maddened soul forward to plunge the abyss,
And yet I shrink back from that horror, on this!

And this strife unending! A soul self-abhorred,
Pursued by the wrath of an infinite Lord!
No price for a pardon, by pain or by pelf;
No flight from perdition, but flight from myself!

No flight from the universe stained with my sin,
From vengeance without and from vengeance within!
From the infinite law, all-enduring and strong,
From the guilt, and the shame, and the ruin of wrong!

"SIN!" blazes in wrath on the universe walls,
"SIN!" moans evermore through mind's innermost halls;—
One groan from creation sin's agony tells;
All worlds are polluted—all heavens are hells!

O, Father omnipotent, all thrones above,
Can this be my doom, and thy nature be LOVE?—
No choice in my being, no choice in its end?—
Can goodness and justice thus fearfully blend?—

O, Father, unfold this inscrutable plan!
O, save me from cursing the Maker of man!
Though banished forever from glory above,
Let me know that the law of existence is love.

My sin I confess, and its punishment due,
'T were better I perish than God be untrue:
I justify this: but, if destined to fall,
Why did He, who knew this, create me at all?

Foreknown is not fated, I see, should my choice
Have been free to be, or to not be? No voice
Can come from non-entity, God must decide;
Deny me existence, or make, and provide.

III. THE DEBATE IN ETERNITY.

Lo, infinite Holiness, Wisdom, Power, Love,
Propounding the problem of being, above;—
God, space, and duration,—alone and immense,—
No matter, no spirit;—void—silence—suspense!—

'If goodness and wisdom create, what they do
Must be holy and wise and beneficent too;
It could not be other, good can not do ill,
Nor can it be passive, and be goodness still;—

The power to do good, unexerted, is ill;
Exerted, this infinite void it must fill
With good like itself, not in rank, but in kind,
With being, and beings, with spirit and mind.

Diversity, too, must be part of the plan,
For goodness must flow through all forms that it can,
Or the good is not infinite; hence every grade
And mode of existence, for good must be made.

But good must be free, or it can not be good;
No virtue in yielding what can't be withstood,
No worthy obedience where law is too strong,
No praise for the right, where there can not be wrong.

Then goodness demands that each rational mind
Have in its own structure, unforced, unconfined,
The power to originate evil, and sin
Unfettered, untempted, ere good can begin.

Nor is this misfortune to him, but his right,
His being's perfection, his gate to delight,
His excellence godlike, that gives him the power,
Unfallen, to merit his heavenly dower.

And what though, in rashness and folly, some world,
Some order celestial, from glory be hurled;
Their sad lapse shall prove the high freedom we gave,
And call forth new wonders to rescue and save.

But some, lost forever, shall shoot the abyss
Of infinite evil; like planets that miss
Attraction and orbit, quit order's bright shore,
And darkle down gulfs below gulfs evermore.

All this, in its dread possibility, waits
The word that one moral immortal creates!
Yet myriads on myriads wait being and bliss
From the fiat that startles a specter like this!

Aye, being were better than never to be,
And being were noblest, intelligent, free;
And knowledge and freedom, with evil foreknown,
Were better than blind brute-existence, alone.

Yea, being *must* be, since, though evil befall,
Far vaster the evil, no being at all;
Then God were the sinner, small evil repressing
By great, by withholding the universe-blessing.

This is no dilemma, but infinite sight
Discerning the only, the absolute right;
And infinite Reason demands right be done;—
LET THERE BE!"—And there was—and creation begun!

That fiat, impulsive, smote deep through the void,
And space flashed with sundrifts, like armies deployed;
Force, matter, mind, spirit, from monad to man,
And all the bright complex of being began.

IV. THE ASSENT OF REASON.

O, Father Omniscient; Abyss of pure love,
Perfection! Perfection! Beneath and above!
Perfection! Perfection! All, *all* things done well!
Perfection forever, in heaven, earth, and hell!

O, Father of Mercy, forgive thy rash child,
Gone wild in rebellion, in anguish gone wild!
My being was infinite goodness expressed,
I never can curse thee, for once I was blessed.

I never can curse thee, though down the dark steep
Of evil unending in sorrow I sweep;
The great *gifts* of being, power, freedom, were *thine*,
The *choice*, sin or virtue, shame, glory were *mine*.

V. LOVE VICTORIOUS IN REDEMPTION.

O, Father of Mercy, what now do I see!
God-Christ! God in man! He is dying! For me!
O infinite tenderness! stronger than death,
My life his last heart-throb, my name his last breath!

"Forgive them," "'t is finished!" he murmurs, and dies!
Earth reels in amazement! Night mantles the skies!
All nature avows him! The dead quit their grave!
He dies; but he rises, the MIGHTY TO SAVE!

Hail, thorn-crowned Redeemer! My sad, bitter heart
Breaks down, mercy-melted! My frozen tears start!
My dark doom was just, this is mercy alone,
Such mercy as none but my God could have shown.

My Substitute there in that Victim I see,
The wrath that o'erwhelms him had else o'erwhelmed me;
He pays my last debt, blots the page with his gore,
And the stained sword of justice gleams lightnings no more.

O, LOVER! I perish! I fly! I embrace
My death in thy dying! my life in thy grace!
New power to hate sin, and new power to love good,
Stream flooding my soul with the rapture of God!

VI. POSTLUDE.

Sin's riddle is ended. Doubt's problem is clear.
Earth, heaven, and hell, are all justified here.
Yea, let God be righteous, though man's be the loss;
Down gulfs and abysses light streams from the cross!

From gulf and abyss by the cross I ascend.
There hangs my Redeemer, my Judge, and my Friend;
My ransom, my cleansing, my joy evermore;—
I gaze in rapt wonder, and love, and adore.

Now glory to God, to the Father, and Son,
And Spirit, thrice worshiped, the three in the one;
Praise, honor, and blessing! shout angels again!
All worlds, hells, and heavens, shall echo AMEN!

EDITORIAL MISCELLANY.

EDITOR'S STUDY.

THE POWERS OF THE METHODIST EPISCOPACY.

THE powers of the Methodist episcopacy are at all times a legitimate subject of inquiry. The office is of such importance that the Church can not tolerate in regard to it either looseness of thinking or looseness of practice. Our accepted theory is now substantially the same as it was in the days of our fathers; but there is, nevertheless, a disposition manifest to go beyond the rubric, and to claim for the bishops more than our constitution allows. In the preface to the History of the Discipline last issued the compiler asserts that the episcopacy is a co-ordinate branch of the government of the Church, and compares it with the executive department of our national system. This is the theory which was set up by the Southern minority in the General Conference of 1844, and which was rejected by that conference when it adopted the majority report in the case of Bishop Andrew. More recently a theory which appears to be novel has been presented by the Rev. Professor Raymond, of the Garrett Biblical Institute, in his valuable work on Systematic Theology. If he is properly understood, he maintains that the bishops are essential, in the sense that without them the Church can not be constituted. Certain functions inhere in them, so that should they fail in the performance of those functions the Church would fall to pieces. This view, if consistently carried out, would put our Methodism on a High-church basis, would make us not only Episcopalians, but Episcopalians of the High-church type. As the decisive passage in Dr. Raymond's statement is not of great length it may be well to cite it entire:

"The power of ordination and the right to station the pastors belong exclusively to the bishops. Now, the act by which a minister is ordained is that which confers the right to administer the ordinances; and the act by which a given man is made the pastor of a given people is that which gives existence to a pastorate. The bishop, then, has sole power to do two things, without which a Christian Church can not exist. May it not be said that such a Church is founded upon episcopal authority? that it is essentially episcopalian? It is not pertinent here to inquire how the bishops came by their power—this is not now the question; we are looking at the thing as it is. Looking at the Methodist Episcopal Church as it is, we affirm, for the reasons above given, that it is essentially and fundamentally an episcopal Church, without the discount of any thing essential to a government by bishops, and without any leanings towards any thing else. There are three distinct classes of ministers, as distinct as any three corresponding classes in any episcopal Church that ever was. If we must use the word order, and may say we have two orders in our ministry, we must, for a stronger reason, say we have three orders; for the episcopacy is differentiated from the eldership by an incomparably greater difference than the eldership is from the diaconate." (Vol. III., pp. 492–3.)

According to Dr. Raymond, therefore, the right to confer orders inheres exclusively in the bishops, as also does the right to present the minister to a pulpit. Our bishops, then, have "the sole power" to make a man a minister, and then to make the minister the pastor of a given Church. All turns in this argument upon the words "exclusively" and "sole;" that the bishops ordain and station no one questions; but that they have any exclusive power to do either of these acts is, in our opinion, a very novel doctrine.

It is worthy of notice, as a point of history, that the course of opinion in relation to the powers of the bishops ran steadily in one direction from 1784 to 1844. Our fathers were very careful to show that the bishops had no exclusive powers of any description; that they are a subordinate, not a co-ordinate, branch of Methodist government. Their co-ordination

with the General Conference was never seriously named till 1844, and then by the delegates from the South. The Southern Church has consistently developed this view by giving its bishops a veto on the acts of the General Conference in certain cases. If there is a disposition now to frame new theories of episcopal power, it becomes important to trace the opinion of the Church historically, and to show what from the very beginning it has been. The author of the preface to the "History of the Discipline" has gone over to the opinion maintained by the South in 1844; and it may appear that Dr. Raymond has to all intents gone over to the view held by Alexander M'Caine, which Dr. Emory confuted, with such painstaking care.

The subordination of the bishops to the General Conference, in such sense as strips them of all exclusive power, is so plainly laid down in the Discipline that it seems difficult to miss the meaning of our law. There is nothing in our episcopacy of constitutional validity save the fact of the creation of the office. The third restrictive rule forbids the General Conference to "change or alter any part or rule of our government so as to do away episcopacy, or destroy the plan of our itinerant general superintendency." The General Conference can not abolish the office, and can not make it other than itinerant; but beyond these limits it may do with episcopacy what it will. The General Conference prescribes the mode of a bishop's election, his duties, specifies the act—namely, ceasing to travel—which by its own virtue deposes him and claims for itself the power to originate the episcopacy if by any calamity no bishop should remain in the Church. Each occupant of the office is answerable for his conduct to the General Conference, which has power to order the manner of his trial. The power to create bishops is, of course, a power to originate all their functions. This was the view of our first bishops, Coke and Asbury. They say: "The authority given to, or rather declared to exist in, the General Conference, that in case there shall be no bishop remaining in the Church they shall elect a bishop and authorize the elders to consecrate him, will not admit of an objection, except on the supposition that the fable of an uninterrupted apostolic succession be allowed to be true. St. Jerome, who was as strong an advocate for episcopacy as perhaps any in the primitive Church, informs us that in the Church of Alexandria (which was in ancient times one of the most respectable of the Churches) the college of presbyters not only elected a bishop on the decease of the former, but consecrated him by the imposition of their own hands *solely*, from the time of St. Mark, their first bishop, to the time of Dionysius, which was about the space of two hundred years; and the college of presbyters in ancient times answered to our General Conference."

In their "Address to the General Conference" of 1844 the bishops adopt this very theory of their powers. They say explicitly that orders in our Church are conferred by *election*, and not by ordination. Effective use was made of this position by the majority in their reply to the Southern minority. The passage is not often seen in our day, and is worth quoting in full:

"In order to make out that the General Conference had no right to take such action as they have in Bishop Andrew's case, the authors of the Protest have been driven to the necessity of claiming for the Methodist episcopacy powers and prerogatives never advanced before, except by those who wished to make it odious, and which have always been repudiated by its chosen champions. The protest maintains that the 'episcopacy is a co-ordinate branch of the government,' for which no argument is adduced save this, that it is the province of bishops to ordain bishops. A sufficient answer to this may be found in the principle of Methodist polity stated in the address of the bishops to the present General Conference, that orders (the principle applies to bishops, though not expressly named, as well as to elders and deacons) are 'conferred' by the election, and only 'confirmed' by ordination, and that when the election has been made the bishop 'has no discretional authority, but is under *obligation* to ordain the person elected, whatever may be his own judgment of his qualifications.' And if all the bishops should refuse to ordain the person elected by the General Conference, that body would unquestionably have the right to appoint any three elders to ordain him, as is provided in case there be no bishop remaining in the Church."

What becomes of the "sole power" to ordain, in the light of this language? Dr. Raymond says, "As to the idea of a possible resumption of that power [of ordination] by the

presbyters, it is evidently simply silly to make the supposition." But the General Conference of 1844 *did* make that supposition; made it in a momentous crisis of our history; made it with every circumstance of deliberation and solemnity. Shall we impeach that conference as making a silly defense of its action in the case of Bishop Andrew?

The passage in the address of the bishops to the General Conference of 1844 becomes, then, doubly important: it is the opinion of some of the wisest men who have held episcopal office in our Church; and their opinion was formally sanctioned by the General Conference. We therefore give it at length:

"Without entering minutely into the details of what is involved in the superintendency as it is constituted in our Church, it is sufficient to notice its present departments. 1. Confirming orders by ordaining deacons and elders. We say *confirming*, because the orders are conferred by another body, which is independent of the episcopal office, both in its organization and its action. This confirmation of orders or ordaining is not by virtue of a distinct and higher *order*. For, with our great founder, we are convinced that bishops and presbyters are the same order in the Christian ministry. And this has been the sentiment of the Wesleyan Methodists from the beginning. But it is by virtue of an office, constituted by the great body of presbyters, for the better order of discipline, for the preservation of the unity of the body, and for carrying on the work of God in the most effectual manner. The execution of this office is subject to two important restrictions, which would be very irrelevant to prelacy or diocesan episcopacy, constituted on the basis of a distinct and superior order. The latter involves *independent action in conferring orders*, by virtue of authority inherent in and exclusively appertaining to the episcopacy. But the former is a delegated authority to confirm orders, the exercise of which is dependent on another body. The bishops can ordain neither a deacon nor an elder without the election of the candidate by an annual conference; in case of such election he has no discretional authority, but is under *obligation* to ordain the person elected, whatever may be his own judgment of his qualifications."

This is a confession of faith from Bishops Soule, Hedding, Andrew, Waugh, and Morris. Whatever is distinctive in Dr. Raymond's theory, they assert exactly the contrary. Does Dr. Raymond say that our bishops exclusively "confer the right to administer the ordinances?" These apostolic men say for themselves and their successors that they have no right to confer orders whatever. Does Dr. Raymond say that our bishops have "sole power to do two things without which a Christian Church can not exist?" These bishops claim for themselves only "a delegated authority to confirm orders, the exercise of which is dependent on another body." These two views are irreconcilable; there is no possible mode of bringing them into harmony.

To come to the root of this whole question, What is the Methodist meaning of the word "ordination?" No one is a higher authority in our Church than Dr. John Emory, whose "Defense of our Fathers" has long been a text-book for our ministers. His "Episcopal Controversy Reviewed," which was published after his death, contains the results of his maturest thinking upon the subject. In this latter Dr. Emory says: "The question, 'What was the second ordination for?' is answered with perfect ease and consistency on the principles of Lord King and Mr. Wesley, and equally on those of the polity of the Methodist Episcopal Church. Dr. Cook himself, indeed, furnishes the answer to his own question; and nothing can be more appropriate or correct. 'Ordination to an office,' he says, 'conveys the idea of introduction into one which the person previously did not hold.' Exactly so. This is the precise import of ordination as understood by Lord King and also by Mr. Wesley and the Methodist Episcopal Church. And, therefore, when Lord King explicitly maintains the primitive identity of bishops and presbyters, as to the intrinsic and inherent power of *order*, he as explicitly states, at the same time, that when a presbyter was advanced to the *official degree* of bishop—that is, according to Lord King, was made the actual superintendent, inspector, or overseer of any particular Church, and of his fellow-presbyters (as well as the deacons) connected therewith—he was *ordained* to that office by imposition of hands by the neighboring bishops. But when he says 'by the neighboring bishops,' the reader must not forget that he still does not at all mean *diocesan bishops* of a

distinct order, in the High-church sense; but in *his own* sense of the term *bishop*, as above described. 'The same answer may very clearly explain why it is that the Methodist Episcopal Church, which maintains the identity of bishop and presbyter as to the intrinsic and inherent powder of *order*, still practices a third ordination when any of her presbyters are advanced to the episcopal degree. It is because ordination to an office conveys the idea of introduction into one which the person previously did not hold." Whom shall we believe, Dr. Emory, or Dr. Raymond? Dr. Raymond claims that our Church recognizes three distinct orders of the ministry, Dr. Emory says that the Church recognizes but two. Dr. Emory quotes as his authority Lord King's essay on the primitive Church, from which the Methodist theory of episcopacy was derived; Dr. Raymond, we fear, develops his view from an abstract idea. Certainly the best Methodist authorities are against him.

Dr. Raymond scouts the idea that the bishop is the "agent or officer of the presbytery when he exercises the function of ordaining ministers," and says if this idea be accepted "the Methodist Episcopal Church is in a hopeless condition of non-Churchism." But this is the very idea which Dr. Emory is at great pains to establish. In his "Defense of Our Fathers" he says: "Mr. M'Caine has taken pains to show that the validity of Presbyterian ordination was established by Mr. Wesley, and is the principle of the ordinations of the British Conference. But who ever denied this? Is it not expressly and fully declared in our Book of Discipline in answer to the following question: 'If by death, expulsion, or otherwise, there be no bishop remaining in our Church, what shall we do?' The answer is: 'The General Conference shall elect a bishop, and *the elders, or any three of them, who shall be appointed by the General Conference*, shall ordain him according to our form of ordination.' And this answer shows the good sense of those who framed it, and their acquaintance with ancient ecclesiastical usage; for, as Stillingfleet says: 'Great probability there is that where Churches were planted by presbyters,' as the Methodist Episcopal Church was, 'upon the increase of Churches and presbyters they did, from among themselves, choose one to be as the bishop over them; for we nowhere read, in those early plantations of Churches that, *where there were presbyters already*, they sent to *other* Churches to desire episcopal ordination from *them*.'"

Thus the Church is continually affirming what Dr. Raymond as continually denies, that the power of ordination inheres in the presbytery, and is exercised by the bishops only as the agents of the presbyters. Our fathers took pains to declare that the third ordination had nothing to do with the superiority of the bishops over their brethren; that the third ordination had no connection with their authority one way or the other; that it was merely a solemn method of induction to office. Here, again, Dr. Emory is exceedingly explicit, and quotes John Dickins, the friend of Asbury, as his authority. He writes: "The late Rev. John Dickins, in his remarks on the proceedings of Mr. Hammett, says, in relation to the superiority of our bishops as derived, not from their separate ordination, but from the suffrages of the body of ministers: 'Pray, when was it otherwise?' and 'How can the conference have power to remove Mr. Asbury and ordain another to fill his place, if they see it necessary, on any other ground?' Mr. Hammett had said: 'Let your superintendents know, therefore, that their superiority is derived from your suffrages, and not by virtue of a separate ordination. Gain and establish this point, and you sap the foundation of all arbitrary power in your Church forever.' Mr. Dickens replies: 'Now, who ever said the superiority of the bishops was by virtue of a separate ordination? If these that you there plead for will sap the foundation of all arbitrary power, it has been sapped in our connection from the first establishment of our constitution.'" Dr. Raymond asks: "May it not be said that such a Church is founded upon episcopal authority?" We answer, No; quite the contrary. The episcopacy is based on the authority of the Church, not the Church on the authority of the episcopacy. Dr. Raymond has turned the Church upside-down, and tries to make the superstructure do duty as a foundation.

We may ascend higher still in tracing the origin of the theory of episcopal power held by our Church. Our fathers, and notably Mr. Wesley, derived their opinions from Lord King and Stillingfleet. Lord King was an

English Dissenter, a nephew of Locke, and, in the latter part of his life, High Chancellor of England. He published, in 1691, "An Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church, that flourished three hundred years after Christ: faithfully collected out of the extant writings of those ages." His object was to secure the comprehension of Dissenters; that is, of ministers presbyterially ordained in the English National Church. Wesley read this work in 1746, being then forty-three years of age, and makes this record of its effect on his mind: "In spite of the vehement prejudice of my education, I was ready to believe that this was a fair and impartial draught; but, if so, it would follow that bishops and presbyters are essentially one order, and that originally every Christian congregation was a Church independent of all others." He held firmly to this opinion to the end of life. In his letter accrediting Coke to the Methodists of America he again refers to Lord King's book, saying: "Lord King's account of the primitive Church convinced me, many years ago, that bishops and presbyters are the same order and have the same right to ordain." In his "Episcopal Controversy Renewed," Dr. Emory makes a careful abstract of important passages in Lord King's book. He especially cites two theses maintained therein: "1. That the presbyters [in the primitive Church] were different from the bishops *in gradu* or *in degree;* but yet, 2. They were equal to them *in ordine* or *in order*." These citations are made as embodying the final authority—next to the Scriptures—on the subject for the Methodist Episcopal Church.

Wesley's conversion to the moderate opinions of Stillingfleet was thorough. In 1756 he wrote: "I still believe the episcopal form of Church government to agree with the practice and writings of the apostles; but that it is prescribed in Scripture I do not believe. This opinion, which I once zealously espoused, I have been heartily ashamed of since I read Bishop Stillingfleet's 'Irenicon.' I think he has unanswerably proved that neither Christ nor his apostles prescribe any particular form of Church government; and that the plea of divine right for diocesan episcopacy was never heard of in the primitive Church." In 1780 he wrote to his brother Charles: "Read Bishop Stillingfleet's 'Irenicon,' or any impartial history of the ancient Church, and I believe you will think as I do. I verily believe I have as good a right to ordain as to administer the Lord's-supper." Wesley plainly drew from the "Irenicon" two conclusions: *first*, that episcopacy is not divinely prescribed; and *second*, that bishops and presbyters are substantially the same order, and have the same right of ordination. This theory has descended to our Church as an inheritance; it is our only theory. Any other is without historical sanction, and has no more weight than can be given to it from the name of its author. Of the ancient Church Stillingfleet says explicitly: "The next evidence that the Church did not look upon itself as bound by a divine law to a certain form of government, but did ordain things itself, in in order to peace and unity, is, that after episcopal government was settled in the Church, yet ordination by presbyters was looked on as valid." (P. 402.) Most remarkable are some passages from Cranmer's manuscripts, quoted by Stillingfleet, in which that reformer answers certain questions propounded in the time of King Edward the Sixth. "The bishops and priests," says Cranmer, "were at one time not two things, but one office in the beginning of Christ's religion." "In the New Testament, he that is appointed to be bishop or priest needeth no consecration by the Scripture, for election and appointing thereto is sufficient." (P. 416.)

These are the traditional opinions of the Methodist Episcopal Church. Ordination, therefore, with us, is an introduction to an office; it does not confer orders, which are created by election; the power to confer the orders is, therefore, in the electing body, and not in the ordaining agent; and finally, the ordaining act may be omitted without destroying the existence of the orders, or impairing their virtue. If this be so, ordination by our bishops is simply a convenience, and nothing more, and Dr. Raymond's assertion that the function belongs exclusively to them falls to the ground.

It may be said that our view detracts from the dignity of the episcopacy. We might answer that, whether it does or not, it is the correct, historical view. The dignity of our bishops consists, however, in the value of their services to the Church—services which

they are able to render because the Church has committed to them large administrative powers. We do not need to bolster them up by attributing a mystical efficacy to ordination at their hands.

Our fathers laid stress on the fact that "one bishop with the elders present may consecrate a bishop who has been previously elected by the General Conference." "This is agreeable," say Coke and Asbury, "to the Scriptures. We read 2 Tim. i, 6, 'I put thee in remembrance that thou stir up the gift of God which is *in thee*, by the putting on of *my* hands.' Here we have the imposition of the hands of the apostle. Again we read, 1 Tim. iv, 14, 'Neglect not the gift which is in thee, which was given thee by prophecy with the laying on of the hands *of the presbytery*.' Here we have the laying of the hands of the elders *for the same gift*. Nor is the idea that three bishops are necessary to consecrate a bishop grounded on any authority whatever, drawn from the Scriptures or the apostolic age." Whatever may be thought of this reasoning, clearly our fathers meant that the ordination even of a bishop was not exclusively the function of bishops. Moreover our form of ordination implies that orders are not conferred by the ordaining minister, but by the Church. We say: "The Lord pour upon thee the Holy Ghost for the office and work of a bishop [or an elder] in the Church of God now committed unto thee by *the authority of the Church* through the imposition of our hands." The authority of the Church is the efficient cause of ordination, the ordaining minister is only the instrument. In the Protestant Episcopal Church the formula is: "Receive the Holy Ghost for the office and work of a bishop [or a priest] in the Church of God now committed to thee by the imposition of our hands," etc. Here the bishop confers the order. Dr. Raymond has taken us over to Anglican episcopacy, which is something wholly unlike ours.

We have left ourselves but little space for the second branch of Dr. Raymond's theory—the exclusive power of the bishops to station ministers. The bishops have no such exclusive power, in the sense that the Church can not dispense with their services. That the General Conference is the patron of all our pulpits is a principle of our government so well established that it need only be here named. Our fathers always spoke of the stationing power as a trust committed to the bishops. Dr. Raymond's language would have been very distasteful to them. "But why," say Asbury and Coke, "does the General Conference lodge the stationing power in the episcopacy? We answer, on account of their entire confidence in it. If ever, through improper conduct, it loses that confidence in any considerable degree, the General Conference will, upon evidence given, in a proportionable degree take from it this branch of authority. But if ever it betrays a spirit of tyranny or partiality, and *this* can be proved before the General Conference, the whole will be taken from it." It is an abuse of language to speak of an episcopacy so described as having an exclusive power to station.

Dr. Raymond's language is the more unfortunate because it is found in a volume prepared for the training of candidates for the ministry. Such seed sowing will most likely in time be followed by a baleful harvest. Our bishops have shown no disposition to grasp powers not accorded by law; they have scrupulously kept within the letter of the rules laid down for their conduct by the General Conference. But in some coming day there may arise a bishop of another spirit, a bishop, high, heady, strong for his order, and resolved on increasing its show of dignity and authority. He will find a doctrine already prepared for his justification; he may turn to the "History of the Discipline," and from thence prove that Methodist bishops are co-ordinate with the General Conference; he may turn to Dr. Raymond's "Theology," and prove from thence that bishops have the sole power of ordination in our Church. From this position to divine right is but a short step, and the glory of our Church—an episcopacy, which makes no claim to superiority of order, but is dignified by the character of the men, and the value of their services as executive officers—will be taken away. The latest experiment of an episcopacy will have been defeated, and we shall be back in the old quagmire again. The new doctrine is a departure from the teaching of our fathers, and if I have succeeded in this argument, I have indicated what goal it will be likely to reach. G. M. C.

FOREIGN AFFAIRS.

PARISIAN UMBRELLAS.—One noteworthy fact in connection with the umbrellas of the Parisians is, they are invariably returned when lent. That is, of course, if lent to a friend or acquaintance. If the lender has been forced, through stress of circumstances, to part with his umbrella to the detective-looking employés of that worthy institution, the *Mont de Piété* (the Parisian pawn-shop), well, then, it depends entirely upon himself whether he ever has it returned again. With respect to the ready return of these useful articles, when borrowed for a time by a particular friend, one may well say, "They manage these things much better in France." To return a borrowed article at the earliest possible opportunity is a point of honor with a Frenchman, whether that article be a franc, a book, a piece of music, or last, but not least, an umbrella. Englishmen are not quite so particular. There is a tale told in a French volume of *Jeu de mots*, of a certain London lawyer who used to exhibit a score or two of umbrellas upon the strength of the fee due to him for the advice. When questioned as to the nature of the advice given, his reply was, "I told them never to lend any thing, as it was a bad habit." It is needless to add that the victimized clients were advised after, and not before, the loss of their umbrellas. There is rather more of the *ben trovato* about this than the *vero*; but, at any rate, just for the sake of deriving some moral conclusion, we may safely assume that no French *avocat* would be guilty of such a questionable manner of obtaining his umbrellas as that. He would, of course, repair to the "Printemps" or "Magazins du Louvre," and lawfully possess himself by purchase of such an article, should he be in need of it. But stay! it is an open question whether Parisian lawyers ever make use of umbrellas. M. Gambetta, the *chef* of *avocats*, was never seen with one. Perhaps his fiery impetuosity would lead him to use it as an aggressive weapon with which to rout Paul de Cassagnac or Rouher in the French Assembly. However, the great democratic orator is under an umbrella now—one which overshadows him and protects him from the heat of his own fiery nature—an umbrella whose stick is his title of President of the Chamber, and its covering the authority with which he is invested.

A NATIONAL COURTESY REPAID.—The English Government is about to repay us for a long-past courtesy in the presentation of a dinner-set made from the timbers of the frigate *Resolute*, which it is now proposed to break up. Some of our middle-aged readers may remember the history of this staunch old vessel, which was one of the expedition sent by England in 1853 in search of Sir John Franklin. Running short of provisions, her crew abandoned her in Baffin's Bay, and took to their sledges. She was found by some New London whalers nearly a thousand miles from the place where she was deserted, frozen solid in the ice. They rescued her, and brought her home; the United States Government bought her for $30,000, fitted her up completely, manned her, and sent her to England to be delivered to the queen as a token of national good-will and personal respect for her as a woman. Her majesty and Prince Albert received the gift in person, the occasion was made as marked and public as possible, and a picture of the presentation ordered for the private gallery at Windsor. Now that the old ship is to be destroyed, Her Majesty gracefully proposes to return the little courtesy.

THE ITALIANS IN AFRICA.—We have several times referred to the annexation fever now raging in Italy. At last they have managed to raise their flag in Africa. The warship *Esplatore* has taken possession of the Bay of Assab in the Red Sea in the name of the Italian Government. An Italian colony is being founded in those waters, and the aggression has not merely been unopposed by the sultans and tribes of Darrakil, but they even prepared a congratulatory reception for the colonizers from modern Rome. Captain Amezaga and Professor Sopeto, the leaders of the expedition, are the heroes of the neighborhood. The Italian papers say that neither the English nor any other European government has offered the slightest opposition to the appropriation.

ENGLAND FORTIFYING IN THE EAST.—The latest rumor from Paris is to the effect that Beaconsfield is busy with the project of acquiring a naval station near the mouth of the Euphrates and Tigris, and that the exact spot fixed upon is Shatt-el-Arab. The negotiations, *on dit*, have been intrusted to Sir Henry Layard, who has received instructions to mention the matter to the sultan, pointing out that the acquirement of such a station in the gulf would be much to the interest of the Sublime Porte, especially since Asia Minor has been taken under the *quasi* guardianship of England, and must eventually be defended by English arms should political complications with Russia occur. With a naval station at Shatt-el-Arab, a British army of combined English and native troops from India could be readily landed to oppose any Russian descent from the Caucasus on the Euphrates-Tigris line, and Bassorah would be the English base of operations.

WOOD-CARVING is an industry which has been employing many people at the University of Cincinnati, and indeed so much work has been done in that city as to give it a certain fame for the excellency of its attainments in this line of industry. In Germany wood-carving is being carried to the most remarkable perfection. It is fostered by the establishment of schools for carving, particularly in districts where the wood used for the work—the Spanish walnut, the finest and best walnut the Germans have—is plentiful. Eighty of these carving schools exist at the present time in Germany, and eighty in Würtemberg; but so much importance is attached to the results which have flowed or are expected to flow from these institutions that the number of schools in Germany is to be increased to two hundred.

A WORTHLESS CROWN.—The emperor of all the Russias must be weary not only of his crown, but even of life. He no longer wears a coat of mail, but his carriages are plated with iron, and such is the mysterious secrecy with which he is surrounded that even the most trusted policemen are ignorant half an hour beforehand in what direction he is going. The cook is watched at his work by two special employés, and the kitchen door is guarded by two sentinels. The viands are tasted by experts, and only offered to the czar when they are convinced that no poison is lurking in them. Fond as he is of a good cigar, he is obliged, from similar motives of prudence, to forego the pleasures of smoking. If Czar Alexander were a good Shakespearean scholar he must be frequently quoting, regarding his crown, those immortal words the duke addressed to Claudio regarding life, "If I lose thee I do lose a thing that none but fools would keep."

PATRIOTISM OF GERMAN ULTRAMONTANES.—We have always held that Ultramontanists know only papal authority, and have no other sovereign and know no other attachment outside of their own home. There are Protestants who call this a bigoted notion. What say they in explanation of the recent declaration of the German Ultramontanes that it is unlawful to use church bells to ring in the anniversary of a grand national day, such as the commemoration of the battle of Sedan? Of course they put it on the ground that Protestants take occasion always to boast of this victory as a triumph over the Roman Church, and so a bill has been passed by the lower house providing that it shall not be lawful for the civil authorities to use the bells except to give alarm in cases of fire, flood, and other public calamities. Would n't it be about as well to set the bells a-going, and ring in this national calamity of having Ultramontane influence predominate in German legislative halls?

LIBERIA ENLARGED.—A curious bit of news comes from Africa. The little black republic of Liberia, that rather sickly offspring of the misdirected philanthropy of the American Colonization Society, which a little while ago was fearful of being swallowed up by the British colony of Sierra Leone, has been seized with the annexation fever itself, and has actually appropriated an entire native kingdom bearing the euphonious name of Medina. The new territory adjoins the interior frontier of the republic, and was acquired by friendly negotiation.

JOSEPH'S SUCCESSOR IN EGYPT.—An Austrian Jew named Julius Blum has been raised to the rank of pasha and assistant secretary of state by the khedive of Egypt. It is said that no other Israelite since the time of Joseph of old has reached such eminence in the land of the Pharaohs.

ART.

SIGNOR BRUMIDI.

THE death of Brumidi is a noteworthy event on account of his extended connection with the decoration of the National Capitol at Washington. For nearly a quarter century has this artist been employed by the government in the drawing of his designs and their execution in fresco on different rooms and passages of the Capitol; and his name has become intimately associated with the history of the ornamentation of the public buildings. His previous experience at Rome, in restoring the Raphael frescoes of the Loggie of the Vatican under Pope Gregory XVI, had directed the public attention to him at a time when all foreign art was at a premium, and the efforts of our native artists were little appreciated and less encouraged by the governmental patronage. The strength and freshness of Brumidi's early work were also unquestionable; but his long continuance in public employ must be accounted for on the ground of the impracticability of changing a general plan rather than by any claims to superior excellence over several native American artists, who during the past twenty years have been most diligent and successful in the department of decorative fresco. The persistent industry and singleness of aim of Brumidi are deserving of all commendation, and may furnish a most valuable lesson to the younger artists of the importance of protracted special studies. It is surprising how these specialists immerse themselves in their plans, and work for their execution when others would falter or find time for other occupations. Brumidi worked on till thirty-six hours before his death, with all the patience and industry and hope which had characterized his busy artistic life. Truly he "ceased at once to labor and to live."

Already the question is on every body's lips, Who shall be Brumidi's successor? It is not that the supreme greatness of his work makes it difficult to find men of American birth who could equal and surpass him in design and execution. For it must be remembered that while Brumidi's earlier work was his best work, and some claim that there has been a decadence rather than a growth in the excellence of his frescoes, during the last twenty-five years several of our American artists have been most earnest and successful in their studies, and may most justly outrank Brumidi in his own chosen department. But the serious question will be an economical one: How can the work proceed, and yet the vast sums which have already been expended be available to secure the final result? There can be little doubt that much which has been done could now be much better done; but it is impossible to act upon this principle in the use of public funds. It is sincerely to be hoped that a successor may not be hastily chosen, but that the occupancy of the public thought in the stirring presidential campaign now pending may be so complete as to defer the appointment of a superintendent of decoration till the men best fitted to judge in this matter may have had abundant opportunity to consult together and make recommendation of the very best native artist to push this most important work through another stage of its progress.

Hitherto the artistic work upon the Capitol has generally been of a character to awaken very little enthusiasm among those best qualified to pass verdict upon it. It is devoutly to be wished that the immediate future may have in store for the nation something more truly excellent and inspiring.

ARCHÆOLOGICAL EXPEDITIONS.

FROM time to time, in these art notes, we have pointed out the invaluable service which the general government might render to true learning in the United States by a comparatively limited appropriation each year for purposes of exploration on the sites of old civilizations, and the collection of the objects thus discovered in a national museum at Washington. It will, perhaps, be vain to expect much from governmental aid towards such an object; possibly a new stage of our national life, not yet reached, may witness the accomplishment of an end so desirable. Meantime it is especially gratifying to notice the interest which this subject is awakening in certain circles of scholars, who in quiet but

persistent ways, are trying to enlist the attention of great capitalists in expeditions for exploration. In several of our chief cities—notably in New York and Boston—quiet but earnest meetings have been held, and plans discussed. Some of the most wealthy and generous citizens have received these suggestions with marked favor, and we are not without hope that in the near future an expedition to excavate some rich site of an earlier civilization in Greece, Asia Minor, Egypt, or Assyria may sail from New York, which may return laden with much rich spoil to reward their industry. What General Cesnola, a private man without great fortune, has accomplished in the now famous Cypriote collection may be repeated again and again by well-planned expeditions to any one of a dozen sites which may be visited. Another class of citizens is turning attention to the art and archæology of our own continent, and very earnest attempts are being made to fit out a well-planned expedition to excavate amidst the marvelous remains in Central America and Mexico. The mystery now hanging over the history of this Western Continent can be lifted in no other way than by setting earnestly at work to collect facts and data for a fair and scientific induction. The riddle is not hopelessly insoluble. As in Egyptology, and in the deciphering of the cuneiform writings of interior Asia, so in American remains, persevering industry and skill may place in our hands the key that shall unlock the now closed portals of our past. If private industry and capital shall be rewarded this may stimulate the general government to unite in the furtherance of the work.

DR. ALFRED WOLTMANN.

THIS foremost art-critic and art-historian of Germany died at Mentone, February 6th. His name was so well and favorably known to the American public through his "Holbein and His Time," and as joint editor of the second edition of Schnaase's exhaustive history of art, that a slight notice must be agreeable. We find the following facts condensed in the recent notices of his death. He was the grandson of the noted historian, Karl Ludwig Woltmann, and was educated at the University of Berlin, under the especial guidance of Dr. Waagon, the veteran art-critic and historian. After graduation he gave protracted and patient study to the life and works of Holbein, publishing the results of investigations in 1866, under the title of "Holbein und seine Zeit." As *Privat-docent* at the University of Berlin, as Professor of Art History at the Carlsruhe Polytechnicum, and six years later at the University of Prague, he achieved a brilliant reputation for research and just criticism. His "Holbein and His Times" was completed in 1868. This work was subjected to very severe criticism and strictures by the earnest admirers of the elder Holbein, which led Woltmann to carefully review his ground and issue a second edition, in which, with characteristic honesty, he accepted most of the suggestions of his critics and incorporated them into his work. Among other of his works may be mentioned "German Art and the Reformation" (1867), "Lectures on the History of Berlin Architecture" (1872), "History of German Art in Alsace" (1876), "Netherlandish and German Art during Four Centuries," and he had begun a most valuable "History of Painting," of which only the first volume, treating of Painting in the Middle Ages, was completed in 1879. Besides these works, and performing the delicate and important editorial work on Schnaase's "History of Painting," Dr. Woltmann has contributed a large number of exceedingly able and interesting criticisms on various subjects connected with his life work.

While a professor in the University of Prague he devoted much time to the study of Bohemian art, and took occasion to defend German art against the false accusations of the Bohemians. This criticism of the authorities which had passed as unquestioned in this venerable seat of learning caused much commotion among the Bohemian scholars, and even entered into political questions. It is not, therefore, surprising that his situation should have become somewhat unpleasant, and that an atmosphere of purer and freer thought should have been ardently desired. His appointment in 1878 to the new and progressive University of Strasburg was accepted with gladness, and he had laid broad plans for still more extended and fundamental studies in his favorite department, when his death has produced unfeigned sorrow to a large circle of friends and admirers.

Professor Woltmann's work was cut short in the midst of his highest usefulness, and

the friends of art culture and of criticism have in his early death experienced a sore bereavement.

BARRY—ARCHITECTURE AND UTILITY.

In the death of Edward Middleton Barry, R. A., the Royal Academy of London has lost one of its foremost associates and most brilliant professors. It was generally acknowledged that he stood at the very head of the school which pursued Renaissance art and architecture, and that the Academy had had few more profound and original lecturers. *The Architect* closes a very appreciative notice of his life and works in these words: Barry was elected a Royal Academician in 1869, having been chosen an Associate soon after the completion of the Covent Garden Opera-house. He succeeded Mr. Sidney Smirke in the position of treasurer of the Royal Academy, and Sir Gilbert Scott in that of Professor of Architecture. In this capacity he has delivered courses of lectures marked by great learning, cultivated taste, and vigorous original thought. Singular to relate, his untimely death leaves the Winter course of the present session incomplete, his last lecture, delivered on January 22d, being only the third of the course. Mr. Barry was a Fellow of the Institute of Architects, and one of its vice-presidents, and had received the gold medal. He was a Foreign honorary Member of the Royal Academy of Arts at Vienna, and enjoyed other distinctions.

Edward Barry was original, energetic, decided in his handling of the masses and features of his work, fond of ornament, and somewhat reckless in the use of it, but full of true artistic feeling, and profoundly learned in his own and in the sister arts. His personal character was such as commanded respect and invited confidence. Thoughtful and deliberate in manner, thorough in method, fertile in resource, painstaking and yet bold, he united many of the best qualities that an architect should possess. He attracted those who knew him intimately by a fund of varied information, an unflagging brightness and kindliness of disposition, and an unequaled brilliancy in conversation. The best of companions, his large range of knowledge and experience and the force of his powerful intellect and determined will were graced, but not concealed, by a constant flow of clear illustration and brilliant wit, not unmixed at times with hearty fun—all which it is sad to think will be heard no more by that large circle of friends among whom his society was prized.

It would, doubtless, be interesting to become acquainted with the style and thought of a man who is thus ranked among the very foremost of British architects. The following from a lecture on "Architecture and Utility" may serve this purpose: Architecture, therefore, recognizes utility as the basis of her work, on which she erects a superstructure of her own, with grace of proportion and beauty of ornament. Without such additions utility alone would give us not architecture, but only building. . . . There is plenty of scope for the architect to unite art with utility. We are told sometimes that utility is so far to rule that every portion of a design should declare its use, whether such use be noble or ignoble, and however the architectural composition, as a whole, may be affected by such partial treatment. We see daily, in consequence, designs of shreds and patches, which, while affecting to make a god of utility, are often in reality not convenient, while they offend the sense of fitness, which demands dignity and elegance as well as convenience in architectural work. Nor is this the only evil. In paying tithe of mint, anise, and cummin, the weightier matters of the law are neglected. Young architects are apt sometimes to act as if it were a triumph of their art to throw down at random parts of a composition and accept the result. Irregularity is supposed of necessity to give picturesqueness, and the external quaintness of a house is more studied than the purse or the comfort of the inmates. This, I need hardly say, is a complete inversion of the principle that our art is based upon utility. To indulge in such tastes is doubtless far easier than to study carefully the requirements of each building, and consider how they can be artistically complied with. This, however, and no less, is the duty of the architect, and only by performing it thoroughly can he achieve complete success. It is useless for a house, for example, to be delightful to the architect, with gables, turrets, and dormers, if the owner declares that to such matters have been sacrificed warmth, comfort, and ventilation. A design of architecture must always

be a compromise, and when one class of considerations obtrude themselves with an exaggerated prominency the others become more or less sacrificed. Architecture, of course, is not all utility, and has, in her higher character, claims on the consideration of society at large. She is bound to assert her place in regard to the public buildings of the country. In this position, at any rate, she can tolerate no derogation from her position as one of the fine arts. It is her province to erect temples of worship and to dignify cities. In humbler works it is her privilege to carry a feeling for art into the homes of the thousands. In fine, she has to unite beauty with utility, and apply the result to the service of men. It should not surely be said of our art that all the good is over. We have the past for instruction, and not for blind imitation. The powers of man are not diminished since the days of the artistic giants of antiquity, while science has conferred upon us privileges of which they little dreamt. Architecture, therefore, pursuing her mission, and supported by art on the one hand and by science on the other, may, if true to herself, still look hopefully forward; for in the language of our president's address, "certain it is that architects may look with proud confidence into the future, for they practice an art raised on an immovable basis of science, clothing itself in forms of abstract beauty, enriched by the cooperation of sculpture, and yet made lovelier, when it chooses, by the charms of color. And though no man shall invent a new style—as the foolish phrase goes—for styles are not invented, but evolved—I do not doubt but that in due time the tentative and elective phase through which architecture seems now to be passing will give place to more homogeneous development, in which, while the individuality of the artist finds free room to assert itself, the requirements, physical and intellectual, of each particular country will achieve a more definite and distinctive expression."

NATURE.

SUNLIGHT AND VEGETATION.—Prof. Schübeler, of Christiania, who for nearly thirty years has been engaged in observing the influences exerted by differences of climate on vegetation, has published the result of his observations in a Norwegian journal.

The first of his series of observations refer to Winter wheat, and were undertaken with the special view of noting what effect the almost unbroken sunlight of the short Scandinavian Summers had on plants raised from foreign seed. The experiments were made with samples of grain from Bessarabia and Ohio, and in both cases it was found that the original color of the grain gradually acquired each year a richer and darker color—the difference being perceptible in the first year's crop—until it finally assumed the yellow-brown hue of other home-grown Norwegian Winter wheats. Similar results were obtained with maize, different kinds of garden and field peas and beans, and certain other garden plants, as celery, parsley, etc. In no case has Dr. Schübeler found that an imported plant, capable of being cultivated in Norway, loses its intensity of color after continued cultivation, while in regard to many of the common garden flowers of Central Europe, he believes it may be asserted with certainty that, after their acclimatization in Norway, they acquire an increase of size as well as augmentation of color.

These altered conditions are more forcibly manifested the farther north we go, within the limits of capacity of vegetation for different plants. The change in the case of *Veronica serpyllifolia* and *Trientalis Europœa* is remarkable, the former changing as it goes farther north from a pale to a dark blue, and the latter from white to rose-pink. It is noteworthy that a tinge of red is a common characteristic of the vegetation of Scandinavia, this being observable alike in blue, yellow, green, and white colors.

Color is not, however, the only property affected by the unbroken daylight of the Summers; for the aroma of all fruits is much greater than that of the same fruits when grown in more Southern countries. This is especially observable in regard to strawberries, cherries, and the various kinds of wild berries. This excess of aroma in northern plants and

fruits coexists with an inferior degree of sweetness. Thus the common golden-drop plum and the greengage of Christiania, although large, well-colored, and rich in aroma, are so deficient in sweetness as to seem unripe to those who have eaten these fruits in France or Southern Germany.

This increase of aroma, or intensification of flavor, due to uninterrupted sunlight, has the effect of making many of our most savory garden plants almost uneatable in Scandinavia. Thus common whitestick celery, which has been grown near Christiania with careful attention to methods followed in England, and which in outward appearance could not be distinguished from plants brought direct from Covent Garden market, has a sharp, unpleasant taste.

IMPRISONED LIGHT.—A most curious scheme is detailed in a recent scientific journal, of which the following is a review:

A little reflection will show that if a means could be found for storing up light, as heat and electricity can be stored, the invention would be of almost infinite application. To discover means of this kind has been the aim of an English chemist, Mr. W. H. Balmain, formerly of the University College, London, and latterly manufacturing chemist of St. Helen's, Lancashire, for a period extending over forty years, and the results of his researches were protected in a patent under the name of "luminous paint." It is known that there are certain earths, such as the sulphides of lime and baryta, and some sorts of seashells, which, on being exposed to the light for some time, become luminous in the dark, and apparently give out again the light they have absorbed. Mr. Balmain's idea was to compound a paint of these substances which could be applied to windows, walls of streets, buoys, notices, clock faces, and a thousand other articles which it would be desirable to see at night, so as to render them self-luminous. Owing, however, to the illness of the inventor no practical issue came to his invention until quite recently, when it was taken up in a spirited fashion by Messrs. Ihlee and Horne, of London. A company has been formed to work the patent, and there is already an eager demand for the mysterious illuminant.

The physical nature of this light-storing process appears to be that the waves of light breaking upon the molecules of this sensitive compound start them into vibration, and this vibration, continuing long after the source of light is withdrawn, sets up a succession of ether waves which affect the eye as light, much in the same way as the blow of a bell-clapper gives rise to waves of sound. The sensitive surface of the paint, exposed to sunlight or the more powerful beams of the electric light for a sufficient length of time, will continue to emit light for four or five hours afterward. Of course the "stored" light grows fainter as the time grows longer.

The lords of the admiralty have been experimenting with it at Whitehall, and have expressed themselves in favor of it for lighting up the compartments of ironclads, or for the powder-magazines. A lantern capable of enabling a person to read or work in the dark can be made by framing a few square feet of the painted surface; and the superintendent of the West India Docks has ordered lanterns for use in their dangerous spirit vaults.

THE BAGDAD "DATE-MARK."—Bagdad is noted for a mysterious malady which affects every body in the city, whether citizen or stranger. It is a sore, called a "date-mark," because after it has healed it leaves an indelible mark about the size and shape of a date. It generally comes upon the face, lasts a year, then disappears. The cheek of nearly every man and woman in Bagdad shows the inevitable mark. Sometimes it settles upon the nose, and then the disfigurement is great; sometimes on the eyelid, when blindness is the result.

Strangers are attacked even after a very brief residence; but fortunately, if they are adults, the sore is more apt to come on the arm. In every case the attack runs its course for one year. No treatment, no ointment or medicine, has the slightest effect upon it. Once the sore appears, the sufferer knows what to expect, and may as well resign himself. The Arabs say that every one who goes to Bagdad must get the "date-mark;" or if he does not get it while in the city, he will be followed by it; if he does not get it while he is alive, he will get it after he dies; but have it sooner or later he must.

Dr. Thom, of the American mission, states

that he has examined the ulcer under the microscope, and found it to be composed of a fungoid growth; but nothing that he had ever tried had been able to arrest its course.

PREHISTORIC EGYPTIAN RIVERS.—Dr. Delamotte, who is thoroughly conversant with the geology and geography of Egypt, gives it as his opinion, according to a French journal, that the Nile was not the only river which watered ancient or prehistoric Egypt. The country was then watered, according to him, by all the rivers now dried up, and which the Arabs of the desert call Bahr-el-Abiad, "rivers without water," great beds of sand, in which shells had been found long ago. When these rivers were dried up Dr. Delamotte does not pretend to indicate. But as to the geological phenomenon which has led to this drying up, and, as a consequence, the change into a desert of vast fertile regions, Dr. Delamotte believes he has discovered this, and, after twenty years of work, he has gone to Egypt to verify the data which ought to justify his theory.

In prehistoric times, according to him, all the plateau of Khartum, the rise of which is scarcely sixteen metres, was a great lake, similar to the Victoria Nyanza and Lake Tanganyika, and from which the Nile issued, as it issues to-day from its two lakes; but the cataracts were then much higher than they are to-day, and when the river reached them, instead of precipitating all its mass of water on these cliffs of granite and porphyry, it divided into different currents, which formed the Bahr-el-Abiad of to-day, and which watered the region now changed into a desert. After long centuries, then, the granite and the porphyry of the cataracts were insensibly worn, their level lowered, and immediately the Nile retired from the Bahr-el-Abiad, to precipitate its entire volume into the single channel which it follows to-day. But the scientific proof of this is not the sole object aimed at by Dr. Delamotte; he is also of opinion that to fill again the Bahr-el-Abiad, and thus to increase tenfold the arable land of Egypt, it will suffice to raise the cataracts; that is, to establish at each of them a system of dams and locks. The khedive, it is said, is greatly interested in these fine schemes, and has promised his support to Dr. Delamotte.

LIFE FROM A CHEMICAL STAND-POINT.—The following table, which is a *résumé* of life processes, was presented to the astonished world many years ago by the distinguished scientist, the late Jean Baptiste André Dumas. While the well-established truths there presented are of the utmost interest, it is a matter of satisfaction to remember that "'t is not the whole of life to live."

THE ANIMAL Acts as an Apparatus of *Combustion:*		THE PLANT Acts as an Apparatus of *Reduction:*	
Burns	Carbon, Hydrogen;	Reduces	Carbon, Hydrogen, Ammonia;
Expires	Carbonic acid, Water, Ammonia, Nitrogen;	Fixes	Carbonic acid, Water, Ammonia, Nitrogen;
Consumes	Oxygen, Neutral nitrogenous substances, Fat, Starch, Sugar, Gum;	Produces	Oxygen, Neutral nitrogenous substances, Fat, Starch, Sugar, Gum;
Produces	Heat, Electricity;	Absorbs	Heat;
Restores	Its elements to air and earth;	Withdraws	Electricity;
Transforms	Organic matter into mineral matter.	Borrows	Its elements from air and earth;
		Transforms	Mineral matter into organic.

PENETRATIVE POWER OF THE ELECTRIC LIGHT.—Some time ago an experiment was tried at Saratoga, N. Y., to test the distance at which the electric light would illuminate a given spot; and it was found that a concentrated beam, carried seven miles to Ballston, furnished enough light to read by. A more crucial test of the great penetrating power of the electric light is now furnished by the officers of the French-Algierian Triangulation Service, who recently saw the electric light from the Spanish station of Zetica, from a distance of more than one hundred and forty-six miles. This observation is proof, if proof were needed, of the great value of this light for maritime purposes, when it is exhibited from sufficiently elevated positions.

ENGLAND TALKS WITH AFRICA.—Cape of Good Hope has been brought into telegraphic communication with England by the successful completion of the cable between Aden and Zanzibar. The first message was transmitted between Queen Victoria, the sultan of Zanzibar, and the governor of the South African colonies. Submarine lines of telegraph now almost girdle the entire globe.

RELIGIOUS.

ROMANISM ON THE INCREASE IN OUR COUNTRY.—The archdiocese of New York leads as usual this year in the column of Catholic population, the number being 600,000. The next largest see is the archdiocese of Boston, 310,000. The archdiocese of Philadelphia is third, with 275,000; the archdiocese of New Orleans fourth, with 250,000; the diocese of Chicago fifth, with 230,000; the archdiocese of Baltimore and Cincinnati and the diocese of Brooklyn, each has 200,000. In the number of priests New York likewise leads, with 383, and Baltimore is second, with 261. We remember reading of a man who went up to Peter to get admitted to heaven and was ignored by the sainted apostle holding the keys to heaven, on the ground of not knowing such a place as the one from which the stranger came. He was the first arrival from Chicago. Foolish Protestants have been inclined to attribute this heavenly ignorance to the proverbial wickedness of that city. The Romish statistics explain more satisfactorily. Chicagoans are strangers there because the Church of Rome holds the keys of heaven. Whew, what an honor to New York to stand first!

THE LOOCHOOANS.—In the present critical state of affairs between China and Japan in regard to the suzerainty of the Loochoo Islands, much interest attaches to an official document issued by the Japanese in which it is maintained that the islands are connected by certain geomantic signs in the earth with the Japanese province of Sastuma. The forty-eight characters of the Japanese alphabet are in use there, having been communicated to the islanders by Minamotonotametono. Their language is a mixture of Chinese words clad in the Japanese alphabet. They call their own kingdom Okina, or otherwise Okinawa. As regards their religion, they worship Yi Shib, the Great Spirit of Japan, besides other divinities. In many of their domestic customs, too, the Japanese maintain that their practice indubitably indicates their origin.

IS IT THE POPE'S PAPER?—The circular which announced the appearance in Rome on January 1st of a daily paper, to be called the *Aurora*, denied that it would have an official character, the denial being due, no doubt, to rumors that have been widely circulated that the paper would be an organ of the Vatican. Nevertheless, it is said that public opinion in Rome, now that the paper has been issued quite a little while, regards it, at least, as under the protection and auspices of high papal authority. It is believed that it draws its spirit from the pope himself; without anticipating his intentions or having the air of forcing his hand, it aims directly to follow his policy. In style it adopts that temperate tone which at present prevails in all Vatican utterances. The editor of it is Pietro Balan, who is an able writer and has gained distinction for his historical knowledge. He already holds a high position in the office of the Vatican archives. Now the question arises, why should a spiritual power seek such a secular weapon? Romanism once had temporal power; is it not looking after it now?

EMERSON NOT A THELOGIAN AFTER ALL.—There is a good deal of discussion in the papers about Emerson's theological status. His *credo* is probably doubtful even to himself. He may have Unitarian leanings and Trinitarian tendencies; he is surely no man of settled convictions yet. His essays clearly prove this much. That Mr. Emerson is a much better man in practice than in theory we also know. We remember reading of a theological student who went to Emerson with a complaint that wide differences of opinion prevailed among the Unitarian divinity students at Harvard. "I am not much interested in these discussions," replied the philosopher of Concord, "but still it seems deplorable that there should be a tendency in some people to creeds which would take man back to the chimpanzee. I have very good grounds for being a Unitarian and a Trinitarian, too. I need not nibble forever at one loaf, but eat it and thank God for it, and earn another"

AN APPEAL BY GREEK MONKS.—The landed property which long ago fell to the monks of Mount Athos and Jerusalem from pious testators in Roumania, and which, in 1864, owing

to a failure to appropriate the revenues as prescribed in the act of gift, were sequestrated by Prince Conza, have become the subject of new negotiations. For many years negotiations were carried on concerning them between the Greek patriarchs and the Roumanian Government, but they led to no definite result. An appeal is now made to an article of the late treaty which says the monks of Mount Athos, whatever their native country, shall be maintained in their former possessions and advantages. The monks claim that the confiscated Roumanians' properties are still their rightful possessions.

CHURCHES THAT WON'T HAVE MORTGAGES.—Such, surely, are those proposed to be built in certain districts on the western frontier of Kansas. They are to be made of sods. A few such already exist. The walls are of sods, the roofs are covered with sods, and the floors are of earth. A church can be built, in size about twenty-six by thirty-six, for an outlay of money of only ten dollars, and this has already been done in at least one instance. A wall of sod, if properly built and protected, will last a hundred years. Roofs of shingles and floors of wood are greatly to be desired; but, of course, they add very much to the cost of a church.

A VERITABLE PASTOR OF HIS FLOCK.—Such the Rev. C. H. Parkhurst must have proved to his people at Lennox, Massachusetts, if we may judge from the scene witnessed at his farewell sermon. Our readers will recall him as the lately chosen pastor of the New York Madison Square Presbyterian Church. He had just finished reading the announcement of his resignation, and had given out the hymn "Blest be the tie that binds." Hearing no response from the choir he ventured to look up to find out the cause of this break in the service, when he saw the chorister shaking his head as if to say no. The choir had been overcome by their feelings and were unable to sing. It was not long before the congregation were also in tears. This was a time when all bond and privilege of nature broke.

DONOR TO GARRETT BIBLICAL INSTITUTE.—The paragraph in the March REPOSITORY containing a notice of the endowment of the Professorship of Practical Theology in Garrett Biblical Institute, is at fault as to the name of the donor, it being Cornelia A. Miller, not "Nutter." It would have been gratifying to Mrs. Miller, as well as greatly helpful to the institute, if her coffers had been so well filled with ready money as to have enabled her to give the thirty thousand dollars in cash. The fact is, she gave her obligation to pay this amount in annual installments running through a term of years.

PROTESTANT CHANCES IN BELGIUM.—M. de Laveleye, writing of the Catholic opposition to the Belgian school law, says the priests have begun a reign of terror. Many parents and teachers are being excommunicated for recognizing the state schools. He says now is the golden opportunity of Protestantism in Belgium; and so we say. A little less than three centuries ago the founder of Jansenism was born within the borders of the Belgian country, and in the early opening of the seventeenth century was a professor at the Louvain University, now the great stronghold of Romish theology on the continent. The work Jansenius began was suffered to die out in Belgium, but flourishes still in grand results in Holland. The separation from that country in 1830 only tended to strengthen Romanism in Belgium until the school question brought an issue between the state and the Church. Now when the Church is arrogantly exercising unwarranted liberties, the more liberal and considerate Christianity of the New Testament should find its exponents ready to counteract the influences of infidelity, which are likely to wax strong in the face of such a helpless enemy as Rome always proves in an intellectual contest. We say let the land of Jansenius be evangelized. Why should we not establish a mission there at once?

ANOTHER RELIGIOUS BODY PROJECTED.—The Rev. John Miller, of Princeton, who was dropped from the presbytery a year or two ago, is to have a new church. Since he was dropped he has been preaching at Stony Brook and Plainsboro, near Princeton, where he has had the use of small church buildings. The new church will be put up at Princeton, almost under the shadow of the theological seminary. It will cost a moderate sum of money, be cruciform in shape, and be known as the "Old Church."

A PROTESTANT COLLEGE IN CHINA.—St. John's College has been opened at Shanghai, China, by Bishop Schereschewsky, its president. The full collegiate course is to run through six years. The course of instruction is, the English literature and language, geography, history, evidences of Christianity, natural science, mathematics, natural philosophy, chemistry, astronomy, mental and moral philosophy, international law. This Schereschewsky is a Jew, but has, since his apostasy, made marvelous strides in scholarship, and promises to be a great honor and useful servant in the Church of Christ. Who says no good can come out of Bethlehem?

THE CHURCH OF ENGLAND SUNDAY-SCHOOL INSTITUTE.—This body has made arrangements for the centenary of Sunday-schools. The programme comprises simultaneous services and meetings to be held during the centenary week, from June 27th to July 4th, throughout the United Kingdom and the colonies. Special services will be held in Westminster Abbey and St. Paul's cathedral. There will be a conference at Lambeth Palace, where also a gathering of children will take place.

RELIGIOUS MISCELLANY.—An English curate who has been in holy orders thirty years recently applied for admission to a work-house in Devonshire as a pauper, and the Board of Guardians granted the application.

—Rev. Russel Streeter, who died recently in Woodstock, Vermont, was the oldest clergyman of the Universalist denomination, and possessed the distinction of being one of the fathers of that faith. He was eighty-eight years of age.

—It is fifty years since missionaries first landed in New Zealand, but out of a population estimated at one hundred thousand, there are now only about one thousand who do not make a profession of Christianity. It is said that one-tenth of their income is readily contributed by this people to the support of the Christian religion.

—The only place in the United States where services are held by the Sandemanian Society is Danbury, Connecticut, the place of burial of Robert Sandeman, the leader who gave his name to the sect. Every week the members have a meeting at which they greet each other with a kiss, and then sit down to a dinner provided by a steward in their employ.

CURIOUS AND USEFUL.

AFRICAN SALUTATIONS.—During his explorations of Tibesti, Dr. Nachtigal experienced many dangers and difficulties, losing his way and suffering from want of water and forced night marches. A very interesting account is given of the ceremonials observed by the Tubu people in greeting one another. A most elaborate performance is gone through when two strangers meet in this wild country. Each of the performers covers all his face but his eyes with his turban, seizes his spear and throwing-iron (a curious, boomerang-like weapon, with a long projecting prong in the concave margin), and, thus prepared, the two approach one another. At a distance of about six steps from one another they squat on their heels, with spear upright in one hand and iron in the other. The one then asks, "How do you do?" about a dozen times by means of four different words, having that meaning used alternately, the reply being varied by the use of two words, "Laha" or "Killala." Then one of the two loudly sings the word "Ihilla," which is returned by the other in a similar tone. The word is exchanged again and again, being commenced in a loud, high-pitched note, and gradually run down the scale till it reaches a low base murmur. When it has become so low as scarcely to be heard, on a sudden it is shouted again in a high key, and the gamut is run through as before. This goes on for a very long while, the performers going through it as a strict matter of ceremony, and taking no interest in one another all the while, but looking round at the horizon or elsewhere during their vocal exertions. After a while various forms of the question "How are you?" and the answer, "Well," are introduced. At last questions on other topics are brought forward, although now and again

the "Ihilla" bursts out in the midst of them, but the series of notes in which it is shouted becomes shorter and shorter. At last the "Ihilla" is got rid of altogether, and ordinary conversation becomes possible. Strangers do not shake hands, but acquaintances do. The covering of the face when greeting or meeting strangers is considered as a most important matter of etiquette.

OLD-TIME SCOTTISH MINISTERS. — There were remarkable oddities in the Scottish ministry in days of old. Mr. Kennedy, in "The Days of our Fathers in Ross-shire," recites the following: "Mr. Shanks, of Jedburgh, was greatly perplexed by a text; he could make nothing of it; so, late at night, he started off to Selkirk, a distance of fifteen miles, to take counsel upon it of his friend, Dr. Lawson. He arrived at one in the morning. He had to knock many times at the manse before he was heard. At last a servant appeared, asking who he was, and what in the name of all disorders could have brought him at that hour of the night. The perplexed parson insisted on seeing Dr. Lawson. He had been in bed hours since. 'I must see him, however,' said he, 'and you must hold my horse until I come down.' He knew the way to the doctor's bedroom. He knocked, and entered in the dark. He told his brother minister his errand. Lawson entered into the difficulties of the situation, and, although in a somewhat dreamy state, he commenced an exegesis upon the text in question, showing the bearing of the context, referred to parallel passages, and cleared up the whole subject to his friend's satisfaction, who thanked Dr. Lawson, bade him good-morning, and then, mounting his horse, rode back through the night to Jedburgh. In the morning, about five, Dr. Lawson awoke. 'My dear,' he said to Mrs. Lawson, 'I have had a very singular and not unpleasant dream. I dreamed that Mr. Shanks, good man, came all the way up from Jedburgh to consult me about a text that troubled him.' 'It was no dream,' said Mrs. Lawson; 'Mr. Shanks was here, in this very room, and I had to listen to all that you and he had to say.'"

WHY JOHN ARTHUR ROEBUCK FAILED IN LIFE.—In 1832 Parliament welcomed, as its member for Bath, John Arthur Roebuck, the grandson of John Roebuck, the great English iron-master in his time, and the companion of James Watt in his early experiments on the steam-engine. For years after there was no more powerful member in the house. During the great agitation of the corn question in 1842, and at other times of national crisis, Mr. Roebuck's views were honored with the nation's attention. There never in this world was a better assailant of a job, a more resolute critic of administrative bungling, than John Arthur Roebuck. "Dog Tear-'em," as he christened himself on one memorable occasion, was never slow to fly at the throat of minister or private member when the public interest seemed to demand vigorous action of this kind. But, notwithstanding all these merits, Roebuck failed. The reason lay in an unrestrained indulgence of vindictiveness, jealousy, and a morbid inflation of self-consciousness. He never *could* be in the wrong. In the strife for Union or secession in this country he took ground with the slave-holding confederacy, and displayed a violent hostility to us. But the failure of the South made that class of "unerring" politicians unpopular in England, and in 1868 the man who had proved strong enough thirteen years previously to drive the "Peelite successorship"—as the Aberdeen ministry was called—from power was himself discarded, never more to rise again in political life. The world will not use talents of morbid geniuses. Common sense and an honest heart are alone safe strings to tie to.

THE FIRST OF THE MATHERS.—The church in which Richard Mather, grandfather of the more celebrated Cotton Mather, began his ministry is still in existence and in use at Toxteth Park, near Liverpool. It is described as a small structure of dark stone, completely overgrown with ivy. In its yard are the graves of the early inhabitants of Liverpool, and on its walls are mural tablets to commemorate the virtues of various people. There is no steeple or tower, and the small windows are only slightly arched. Since Mather settled in the New World, and laid the foundation of a famous line of Puritan preachers, his church has seen many changes. At one time it belonged to the Catholics; again the Church of England possessed it; and after being also in the hands of Presbyterians and Congregationalists, it has come at last to be occupied

by Unitarians. It was built in the reign of James I, in what was then a heavy forest, to which a band of Puritans had fled after the martyrdom of John Bradford, at Smithfield.

SUPERSTITION NOT A THING OF THE PAST.—We think so, as we read in the Irish papers of a *miraculous* appearance of the Virgin Mary in a chapel in Ireland, how hundreds gather at night to see a bright, unearthly light in one of the windows, figures, and other attractions, too, and how pieces of the plaster of the church are carried away for their miraculous properties. But we say this is the outgrowth of Romish ignorance and religious bigotry. Yet what shall we say to excuse away such an evidence of superstitious bigotry as that of the Rev. J. F. Cole, who, in administering communion to inmates of the Horsham Workhouse, England, having chanced to spill some of the wine on the apron of one of the girls, cuts out the piece which was stained, and *buries* it, because, by consecration, the wine had become the precious blood of Christ!

ENGLISH LAND LAWS.—The land laws of England are wrapped in a fog so dense as to make the subject intensely unattractive to the general public. Unlike our commercial code, they have their origin in remote and semi-barbarous times, and are overlaid with a mass of mediæval rubbish, a legacy from that wonderful Norman race, who, to the true instincts of feudalism, united a perfect genius for legal quirks and quibbles, and who, having made themselves masters of the land of England, proceeded to write their laws upon it in characters which centuries of change and progress have not effaced. It is not surprising that, under such circumstances, the technical knowledge, without which no law reformer ought to approach such a subject, should have become the monopoly of very few persons. How many, it may be asked, even among practicing barristers, could pass the most rudimentary examination in the laws of perpetuity and entail? But experience shows that the priest who holds the key of the mystery is not always in a hurry to unlock the door. In justice, also, to the generation of real property-lawyers which is passing away, it may be said that they were brought up in a school which regarded the fabric of our land laws as resting upon foundations as immutable as the law of gravitation or the rotary movement of the planets. The mere suggestion that a man might, as in some of the States of America, pass land by the simple words, "I, A. B., sell to you, C. D., for £1,000 (the receipt of which I hereby acknowledge), the lands colored pink on the map copied from the ordnance survey sheet,—No.—, and drawn at the foot of this piece of parchment; and I warrant you against the claims of all persons deriving title through me," instead of by a mass of half mechanical jargon covering two or three skins of parchment, would, in their eyes, savor something of profanity. As the late Mr. Joseph Kay, one of the few practical lawyers who have had the courage to discuss the question from a popular point of view, observes: The subject of the land laws is surrounded by so many technicalities, the law is so difficult even for lawyers to understand, such a vast literature of rubbish has grown up around it, so many thousand cases have been argued and reported upon its meaning, and lawyers are so unwilling to put their own hands to the work of reform, that it is not wonderful that the most singular mistakes should be made by many public speakers, and that the real reforms which are needed should still be wrapped in so much obscurity. Yet the style of warranty deeds is much simpler now than formerly. Even for city lots mention was once made of messuages, water-courses, easements, glebe-lands, meadows, and what not, though the ground was perfectly innocent of them all!

GOD AFTER ALL.—Dr. Carpenter, a leading English physiologist, in an article in the *Modern Review*, writes thus succinctly: "I deem it just as absurd and illogical to affirm that there is no place for God in nature, originating, directing, and controlling its forces by his will, as it would be to assert that there is no place in man's body for his conscious mind." After all, it is only the fool who saith in his heart, There is no God.

TRANSFORMATION OF WORDS.—An old woman was, like Ingo, troubled with "a raging tooth." The Lady Bountiful of the village gave her *eau de cologne* to assuage the pain. A cure was effected, and with her thanks the late sufferer mingled admiration for the rightly named "Oh, do go along," which had made her toothache go along so promptly.

LITERATURE.

WOMAN'S work in the Church has been for the most part diffusive. A little aid here and there, spiritual, social, financial, according to the demand, has been given, and quickly absorbed in general interests, calling for no historian. Woman's special, organized work is now in its first stage; and strange as it appears, in connection with Missions. It is a significant fact that no other cause has united women of various sections, of different social position, of all ages and degrees of talent, and given them definite duties to perform in a systematic way. It is a still more significant fact that special interest in this cause has so increased in a single decade; for we find that between 1868 and 1878 twelve distinct woman's missionary societies were organized within evangelical Churches. This certainly indicates a new era of thought and action. It is a "sign of the times" which augurs well for women of the Church at home, and women without a Church abroad. But although this movement has been forwarded by women as they were moved by the Spirit, and gladly welcomed by hundreds as its claims were set forth, few, comparatively, have any just conception of its extent and importance. No history or cyclopædia furnished the facts and figures eagerly sought for in preparing address or essay; and statistics, meager at best, only related to that denominational society with whose workings the writer happens to be most familiar. These "Historical Sketches" * have been written none too soon. They supply just the information so much needed and desired, carefully and concisely arranged. Each sketch has been prepared by one fully qualified to represent the society whose history is outlined; and hence we have an authentic, impartial account. The result is truly wonderful. It is a complete answer, so far as missionary work is concerned, to the question, What are Christian women doing for the world's salvation? Simple statements of facts, such as we find in this small volume, must add to the zeal and increase the knowledge of many workers all over the land. As a few soldiers, weary with the march, feel new life thrilling every nerve when from a hill-top they catch a glimpse of moving ranks of comrades with flags of victory flying, so we gain courage as we comprehend the meaning of statistics—lists of missionaries, and records of deeds accomplished. We are no longer alone. We are part of an army of loyal Christians, animated by a single purpose: the elevation of woman every-where in the name of her risen Lord.

We heartily commend these sketches to all who are interested in any form of mission-work, and still further trust their influence for good may reach those who are as yet indifferent to the great aggressive work of the Church.

The price of the book brings it within the reach of all—50 cents in paper covers, 75 cents in muslin. Copies may be obtained from the publisher, or from the headquarters of any woman's foreign missionary society. L. A. S.

A WHOLE generation of theological and Biblical students have grown up in the use of Fairbairn's "Typology," and the work still retains its hold upon the same class of persons without any diminution of favor or authority. It is at once learned, thorough, and eminently evangelical, and though treating of subjects upon which most men become more or less fanciful, it is always sober and judicious. We are pleased to see that such is the steady demand for the work that a new edition is called for, of which the first volume is already in hand, with the promise of the second soon to follow.* It is one of the books that students of the Bible and of Christian doctrines can not afford not to have at hand.

Amid the Shadows † is a story of domestic life, with its lights and shadows; but in this case the shadows predominate, as usual in

* HISTORICAL SKETCHES OF WOMAN'S MISSIONARY SOCIETIES IN AMERICA AND ENGLAND, with an Introduction by Miss Isabel Hart, of Baltimore. Boston: Published by Mrs. L. H. Daggett, 287 Bunker Hill St.

* THE TYPOLOGY OF SCRIPTURE: Viewed in connection with the whole series of the Divine Dispensations. By Patrick Fairbairn, D. D., Principal of Free Church College, Glasgow. Vol. I, ninth edition, with enlarged index. New York: N. Tibbals & Sons. 8vo. Pp. 420.

† AMID THE SHADOWS. By Mary F. Martin, Author of "Mary Leighton," etc. New York: National Temperance Society. 12mo. Pp. 412.

temperance stories. It is well written, wholesome in its tone, and excellent as to its moral teachings and tendencies.

ROBERT CARTER & BROTHERS appear to be fairly launched in the business of reproducing foreign religious novels, generally of the better class, though some of them are poor enough. Among the latest of these are:

The Children of the Kingdom; The Story of a Great Endeavor. By L. T. Meade, author of "Scamp and I," etc. 12mo. Pp. 338. A vivacious story, or succession of stories, chiefly of young people. *The Maiden's Lodge;* or, None of Self and All of Thee. A Tale of the Reign of Queen Anne. By Emily Sarah Holt, author of "Mistress Margery," etc. 12mo. Pp. 248. A really good and wholesome story. *Nellie Arundel.* A Tale of Home Life. By C. S., author of the "Gabled Farm." 12mo. Pp. 212. A London domestic story. *A Chip of the Old Block;* Being the Story of Lionel King, of Kingholme Court. By Emma Marshall, author of "Stellafont Abbey," etc. 18mo. Pp. 121. A sketch of a good man's life and death. These are all good books of their class, and externally they are elegantly "gotten up."

The Broken Looking-glass; or, Mrs. Dorothy Cape's Recollections of Service, by Maria Louisa Charlesworth (12 mo., pp. 313), is among the best of the many good books by the author of "Ministering Children." We say this advisedly, though the praise is very high, having carefully examined the first edition with a view to its republication. *Framilade Hall;* or, Before Honor is Humility. By Emma Marshall, author of "Miss Haycock's Chronicles." 18 mo. Pp. 128. *How a Farthing made a Fortune;* or, Honesty is the Best Policy. By Mrs. E. C. Bowen. 18mo. Pp. 153. Three pleasant little story books, such as female authors write, and which evidently young people read, else they would not continue to be published. Though not positively harmful, yet they must be rather light feeding for thoughtful minds.

The Interpreter's House; or, Sermons to Children, by William Wilberforce Newton (18mo, pp. 349), is a really good book, and can not fail to be attractive to any boy or girl whose taste has not been vitiated by too much use of the light reading produced by even our religious publishing houses, and found in abundance in Sunday-school libraries. Mr. Newton seems to be especially adapted to this kind of writing both by his capabilities and his inclinations.

Among Robert Carter & Brothers' latest issues of religious fictions are the following:

Muriel Bertram. A Tale. By Agnes Giberne, author of "Aimee," etc. 12mo. Pp. 536. *Hester Trueworthy's Royalty.* By the author of the "Win and Wear" series. 12mo. Pp. 337. Both of these are as to their matter among the best of their class, while in their material dress they are equal to the best.

They have also just issued Dr. J. R. Macduff's *Memories of Patmos;* or, Some of the Great Words and Visions of the Apocalypse, a work somewhat expository, but much more devoutly, even rapturously, appreciative—good, wise, and valuable meditations on matters of the highest possible importance.

Two new volumes have been added to the series of "English Men of Letters," edited by John Morley, and republished in this country by Harper & Brothers—*Bunyan*, by James Anthony Froude, and *Chaucer*, by Adolphus Willard Ward, carrying the whole number issued up to sixteen, with more to follow. The sketch of Bunyan (12mo, pp. 178) is just what might be expected of such a writer as Mr. Froude, treating of such a subject as the author of the "Pilgrim's Progress" and of the "Holy War." On the literary and philosophical side no better delineator need be desired, and on the theological and religious no worse or more inadequate could well be found. It is, indeed, wholly impossible for a universal skeptic duly to appreciate such a character as Bunyan, or, having most improperly become his biographer, to do him justice. The sketch of Chaucer (12mo, pp. 199) is but sparingly biographical, being chiefly literary and critical, and the writer evidently enters upon his task *con amore*, and yet not with a blind admiration. The place of father of English poetry is asserted for the author of "Canterbury Tales," and the claim is not only justified, but also greatly enlarged and illustrated. If we mistake not, this one will prove to be among the very best numbers of the series.

EX CATHEDRA.

OUR EDUCATIONAL INSTITUTIONS.

We have heard the expression on several distinct occasions within the recent past, "our next great Church movement should be in favor of our educational interests," and because those expressions put into words our own deep convictions, they the more deeply impressed and interested us. To a very limited extent we have, as a Church, been somewhat actively engaged in the promotion of education for over half a century. The zeal and energy displayed at the beginning of the movement were rather remarkable and certainly very highly honorable, though, from the necessities of the case, the scale on which things were done was a very limited one. And yet these first efforts achieved really excellent results. The large boarding seminaries for pupils of both sexes, found chiefly in New England and some of the Middle States, and somewhat in the middle West, accomplished a good work, which still continues to a limited extent, though the development of the intermediate public schools throughout those States has somewhat interfered with their growth. More recently the Church's attention has been chiefly directed to the higher forms of education, as given in colleges (proper) and theological schools, although in many parts of its work there is still an unanswered demand for academical institutions.

It is evident also that for the last twenty years the progress of our educational affairs has not kept pace with the enlargement of the Church and the growth of its principal benevolences. During those years while the membership of the Church has nearly doubled, and their private wealth more than quadrupled, the growth of our higher literary institutions, whether in students or in property, has advanced comparatively slowly. The necessity for increased expenditures has also been felt and yielded to, and as the result scarcely any one of our higher institutions can get on without large contributions with which to meet their current expenses. It can not be denied that these institutions are not in a satisfactory condition financially, and that on account of the embarrassments from that source all their affairs are suffering. The conviction of these things has suggested the expressions referred to at the beginning of this paper. Our people are more than ever before convinced of the necessity of prosecuting the interests of collegiate education under the auspices of the Church, and they are beginning to feel that an advance movement is imperatively called for.

In order to place the educational affairs of the Church in a satisfactory shape, the first great requisite is a large amount of money, very much larger than has hitherto been possessed and enjoyed by any of our institutions. All of these are now moving feebly and painfully for want of funds, the faculties are inadequately paid, needed appliances for education are not at hand, and, generally, there is a lack of many things which can not be had without money. The members of the faculties of instruction are embarrassed by poverty, the students fail to gain the advantages that should be brought to them, and the boards of trustees find themselves all the time confronted by demands to which they can not respond. The time has, therefore, come when our men of means must take hold of this business with a strong hand, and meet the demands of the case with a liberality hitherto unknown, except in a few recent cases, chiefly about New York. No institution of collegiate grade can be properly conducted without productive endowments equal to half a million dollars, and a whole million should be considered as requisite to its proper management. There is evidently sufficient ability among the people, and we believe the needed liberality will not be found wanting whenever the case shall be properly made out and presented. But for that purpose there must be a free examination of the subject, with mind acting upon mind, thus giving the inspiration and stimulus that comes only of hearty and concerted action. There must also be the assurance that the money when given will be carefully kept and sacredly devoted to the cause for which it is designed. The history of past transactions is not assuring in that respect; but it is quite possible, as certainly it is desirable, that funds may be so invested that neither the faculty of

the college nor the board of trustees themselves can use the funds for any but their appropriate purposes. Wesleyan University, after suffering largely in that matter, adopted a method, through an amendment to its charter, by which none of its permanent funds can be spent, or in any way alienated from their true end. Something of that kind is necessary in all cases, if the liberality of our people is to be called out and made available.

Our institutions of learning are in many cases scarcely more than nominally Church institutions. Some of them are almost entirely independent organizations and still more are only remotely connected with the working machinery of the denomination. The superintendency of the Church does not cover them, nor are they at all subject to either the legislative or the executive action of the General Conference. Too much subjection of the boards of trustees of our colleges and seminaries to ecclesiastical authority is certainly not to be desired; and yet it may be doubted whether the almost complete independence of these boards of any Church control or authoritative oversight is not itself an evil. Certainly, in fact, and also if it may be so, in form likewise, our institutions of learning should be closely connected with the Church itself. As they must live *by* the Church and *for* the Church, it seems only fitting that they should be in some not merely nominal way subject to the Church's guidance. But above every thing else, the religious element should be prominently and controllingly present in our schools. Sad experiences have shown that even Church institutions are not always nurseries of piety nor even of good morals; while, on the other hand, it is equally certain that it is possible to make them quite the equals of Christian homes, especially for the promotion of conversions. And we do not hesitate to say that the Methodist institution which fails at this point forfeits its own right to be. The religious *status* of the school must be made the primary concern with all who have charge of its affairs. A wide-spread revival of religion of the genuine Methodist and New Testament type among a body of students is an event of inestimable value, a blessing with which no degree of temporal or financial prosperity can be compared. Hitherto our institutions have suffered not a little by too frequent changes of some of the chief officers of government and instruction. It may be hoped that with better endowments this evil will be abated. Certainly the Church has no higher or more sacredly responsible position to offer to any one than the presidency of one of her chief colleges or theological seminaries, and the incumbents of these places should recognize that fact and steadily refuse to be allured away to any other positions. An office is degraded when it is used as a stepping-stone to some other place. More than forty years ago the early apostle of Methodist collegiate education declined the episcopacy in favor of his own chosen work. Let his successor consider his example.

DEATH OF DR. DASHIELL.

When, two months since, we inserted in these pages a brief note respecting the death of Bishop Haven, the shadow of two other great sorrows was resting upon us. Simultaneously, almost to the hour, with the demise of the bishop, departed also a member of the New York East Conference—Rev. William Macallister—less known, indeed, to fame than the others, though not without an honorable local reputation, whom we had known and cherished for thirty-five consecutive years as a faithful and successful minister of the Gospel and a man upon whose good name there was no shadow of disgrace, but who was known to us chiefly as a faithful personal friend. The time of these two deaths was almost exactly the same with that of the revelation to his friends of the fatal and hopeless character of the disease under which they had seen Dr. Dashiell to be suffering for several months previous. Thus almost at once were three cherished friends stricken down at our side, who now seem to our lacerated feelings to have been nearer than almost any that survive them.

Of the public career of Dr. Dashiell, and of the qualities of heart and mind, the attainments and habits that made up the basis of his public reputation, we willingly leave others to speak, not doubting that proper respect will be shown to his memory. We choose rather to think and speak of him as he appeared in the narrower and closer relations of private and personal life. This began with us some ten years ago, but became much closer and more constant eight years since, when he

first came into the office of the Missionary Secretaryship, where we were naturally brought into frequent and informal connections. Personally we were friends, and both of us had perhaps come into our several places by the other's help; but we had never been intimate, and there were existing facts that might seem likely to keep us somewhat apart. We were not of the same parties either ecclesiastically or politically, and both were sufficiently pronounced in our opinions, and not disposed to surrender them lightly. But we had both learned to tolerate dissent from our own convictions, and not to make differences of opinion an occasion for personal alienations. Being thus thrown together in the discharge of our several duties, we met each other as friends and fellow-workers, each giving and receiving the considerations due to and from each other.

It would, indeed, be something to be regretted if between two Methodist ministers thus brought together there should not grow up something of personal esteem. But with Dr. Dashiell such a thing was indeed impossible, unless for positive reasons, in some particular cases, he found cause to shut up his heart in silent reserve. He was, however, beyond most men open-hearted, frank, and genial among his friends—in which category he seemed to include all with whom he was brought into personal relations, unless he had found positive reasons for withholding his confidence. And as such we knew him for these almost eight successive years,—always cheerful and sunny, full of hopes and high purposes and resolves, ambitious without intrigues, and coveting the best things, without a shade of envy at the success of others. He was reverent and devout, without a spark of fanaticism, and his religious life was free alike from morbid mysticism on the one hand and from sour austerity on the other—a sober, earnest, cheerful godliness.

Such repeated deaths among one's most intimate friends can not fail to render impressive the fact of the constant nearness of death and one's liability at all times to its advent; and the survivors, after such decimations from their ranks, are almost in doubt whether they themselves are yet alive, or are not on the verge of passing away also. The region and state of the dead are brought very near to us when the friends of our past years, coming down to yesterday, are to-day borne away into the "land of darkness and the shadow of death," "that unfrequented country, from whose bourne no traveler returns." It is, perhaps, useful for the living thus to consider these things, that the emptiness and the transitory character of earthly things may be justly estimated. And yet even this may be carried quite too far, since while we live we have our duties in this world, in which we should be above all things else concerned.

This sudden removal of able and effective ministers of Christ from the activities of life, with its promises and hopes, its ambitions and high purposes, presents to our consideration a form of experience much less frequently dwelt upon than some others, yet especially deserving of attention. Ripe old age is the natural time to die, and continuous and protracted sickness accomplishes for its subjects much the same results; and by a kindly law of our nature, with which grace may also co-operate, the fear of death is usually dissipated as that solemn transition is thus neared by steady and irreversible approaches. But the case is quite otherwise when at life's high noon, with its present activities and its purposes for the future, with laudable ambitions looking out into coming years, that seem to be burdened with promised successes. Then, indeed, is the announcement of death's near approach doubly terrible. The best of men have a strong, natural, and instinctive love of life, which wasting sickness may destroy or the natural decadence of years wear out; but while occupied in life's duties and interested in the enterprises of life, death is practically removed to the distant future; and if then it comes suddenly and unawares, it is always more than unwelcome. The crushing out of such high hopes, and present hasty preparations of the mind for a speedy exit from all present cares and concerns, constitutes the severest possible test of one's faith.

We observed this process in the case of Dr. Dashiell with a lively interest. Few men had more to make him cherish life than he had. His social and domestic relations were at once rich and happy. His physical make-up was such as to be itself a perpetual source of real pleasure; his mind strongly inclined to be joyous in all his estimates of the present and anticipations of the future. He was no doubt

ambitious, but his attainments had uniformly answered to his aspirations; so that even his high hopes became causes of enjoyment, and the future promised still further favors in the same line. And yet, with all these advantages—which beyond all else might seem to render death a terrible despoiling—at life's high noon came suddenly the fatal announcement that his work was done, that he had only to die. Just what were his mental and spiritual exercises as the conviction of these things forced themselves upon him can not be told; but this we know, that he met his fate with the nerve of a philosopher and with the steady faith of a Christian. We have learned to lay but little stress upon the reported utterances of the dying, but the calm and steady expressions of faith in the near view of death, while the powers of the mind remain in full force, are inestimably precious. And such was, in an eminent degree, that sober but confiding declaration made by Dr. Dashiell some time before his decease. In answer to the inquiry of a friend as to the outlook into the future, he is reported to have replied: "When I look downward upon myself and the world, all is clouds and darkness; but when I look upward, the hills are radiant with the divine glory." And just such are the aspects of the case to us, who live to mourn over his death, but also to rejoice in his departure to be with Christ; on our sides all is clouds and darkness, but on his only is the excellent glory.

THE "SALVATION ARMY."

ONE day early in March last a company of half a dozen or more men and women appeared in New York, having lately arrived from England, who announced themselves as the advance guard of a larger number, as members and representatives of an organization called by themselves the "Salvation Army." They are, as their style would suggest, evangelists, representing a voluntary and non-ecclesiastical organization, designed for aggressive work, for the conversion of the unsaved masses found so fearfully numerous in our great cities, and over whom the Churches seem to have very little direct influence. They are reported to be orthodox in their beliefs and teachings, dwelling especially upon the great doctrines of sin, and salvation by the atonement of Christ and the power of the Holy Ghost, and especially never losing sight of the fact of the real presence and the subtle devices of the great adversary. Their methods are distinctively aggressive, as becomes an attacking guerrilla force. They are also evidently self assertive, and they tell in advance—and some may think a little ostentatiously—what they are and what they propose to do. Their organization is somewhat military in form, with an undue proportion of officers, with military titles, and they also wear a regalia, or uniform, in which the various official ranks, from commandant downward, are duly indicated and distinguished.

Of the success or failure, the strength or the weakness, of this particular movement, it would be an act of temerity to attempt at this stage to speak positively, and wisely discreet persons, taught by the lessons of the past, will adopt the policy and the counsel of Gamaliel, to "refrain from these men and let them alone;" for if their work is of God, then they should be encouraged; and if not, it will soon come to nought—not, however, without having done some real and abiding mischief. It must also be remembered, as one of the lessons taught us by the history of religion, that in not a few instances extra-ecclesiastical agencies have seemed to be necessary to arouse the Church from its Laodicean dullness, and to lead it forward in its work of saving men's souls. While we must look to the organic Church as the principal and perpetual agency for the establishment and maintenance of Christ's kingdom in the world, there seems also to be a need for other and less formally regulated agencies, especially for arousing the Church to its own duties, and also for making aggressions upon those whom the Church's ordinary agencies fail effectually to reach. This was eminently the case in Great Britain at the time of the great Methodist movement of the last century, when the Church authorities of that kingdom fell into the disastrous mistake of either disregarding or opposing that movement; and now, as a consequence, half of the Protestantism of the kingdom is outside of the national Church, with a much larger proportion of the real religious life.

There is, indeed, but little danger that the mistake then made will be repeated; perhaps the tendency is to the other extreme—a kind of

tacit acceptance of the notion that any really aggressive Christian work, in order to be effective, must be carried on outside of all regular ecclesiastical organizations. This tendency is, we think, more manifest in Great Britain than in this country, of which the more marked effects of the Moody movement in that country, as compared with this, were at once the results and the evidences. The revival practices of most of the evangelical Churches of this country were comparatively but little known among the Churches of Great Britain, so that a new field was entered upon in that country; and out of the success of that work has grown up certain extra-ecclesiastical evangelistic organisms, which are designed to perform a work which the Churches in that country fail to do, but which is thoroughly attended to by the evangelical Churches of this country. The experiment is not without its perils, and it would be almost too much to expect that it would be entirely free from evil results; and yet there is good reason to hope that much more of good than of harm will come of it. There is a wonderful restorative power in Christian truth, and though mixed with a great deal of human folly, both of head and heart, it is still mightily effective for good. The preaching of the truths of the Gospel, though from motives much below the simplicity of the spirit of the Gospel, is nevertheless oftentimes highly effective of good results; and it is not safe to forbid any who speak in the name of Christ because they are not of our party.

In this spirit we have endeavored to look at all such eccentric and exceptional movements as those of these "Salvation Army" people. If the great Head of the Church can use them for the furtherance of his cause in the world, we will rejoice in their work; and while doubtful as to what they are, we would still hesitate to oppose them "lest, haply, we be found even to fight against God." And yet we confess to certain most decided misgivings, caused by certain things seen in their manners and movements. A little too much ostentatiousness of manner and of earnest self-assertion seems to display itself. An unnecessary amount of organization and machinery, too many officers ("many masters"), too much regalia, an undue amount of announcing in advance what is about to be done, and in general a self-asserting egotism that does not savor of the Gospel, give room for a fear that the whole movement may lack the godly humility and simplicity required for its highest effectiveness. They who set themselves to reform the world must show themselves to be unselfish in their work, and they who would lead men to Christ must display in all their conduct and methods the simplicity and humility of Christ. Some things that appear in the displays made by these "soldiers of Christ," these latest "crusaders," make us afraid for them. And yet because of the great necessity for some agency that may reach the festering and perishing masses of our great cities, we are inclined to look hopefully towards any effort in that direction, and to wish them God speed.

It is not necessary to call attention to Dr. G. L. Taylor's poem in our present number; for it will surely sufficiently attract the attention of every thoughtful reader. It is a production of the class of Pope's "Essay on Man," where the vehicle of verse is used to transport a very heavy burden of solid thought, by which, indeed, the special poetical excellences of the vehicle may be concealed by the superincumbent mass of deep philosophy. It will, however, be found decidedly readable, and also thought-provoking. We do not, however, for a moment accept it as solving the profound problems with which it deals. In his failure, however, the writer has an abundance of distinguished companions, among whom are such philosophers as Leibnitz and Bledsoe, and such poets as Pope, and Goethe, and Shelley—not to name the author of "Bitter-Sweet"—and of learned divines "a very great multitude." All these have by turns tried their hands upon the weighty theme, and, like the suitors with the bow of Ulysses, each has in turn failed in his efforts; though, somehow, each seems to have thought that he had hit the mark. Milton makes the discussion of these points the pastime of the lost spirits. Perhaps it would be wise to leave it to them. No doubt, God's ways are all right; they are also "past finding out," and all our theodocies are superserviceable attempts to justify the divine dispensations in a court before which he refuses to plead.

NATIONAL REPOSITORY.

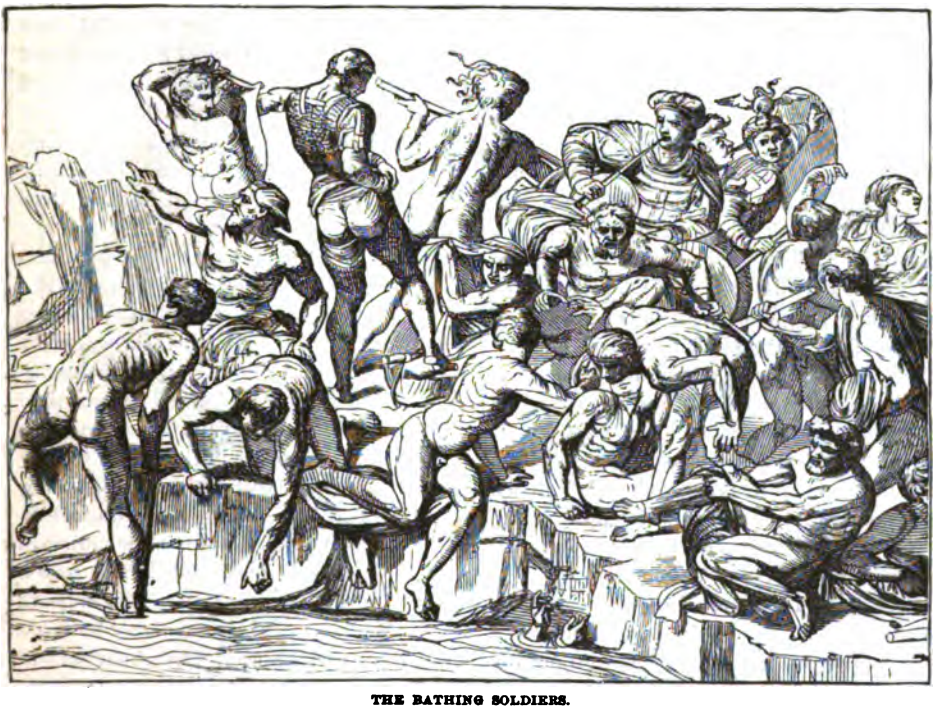
RAPHAEL.

SECOND PAPER.



THE BATHING SOLDIERS.

A NEW realm of art was opened to Raphael in the rival picture to Da Vinci's "Battle of the Standard." It was Michael Angelo's "Bathing Soldiers," designed like that of the other artist for the decoration of the Palazzo Vecchio. On this canvas were exhibited scenes of vigorous and heroic life, the intensity of the highest passions in a manner so far superior to any thing that had ever been presented that the work became the subject of daily discussion among the art students of Florence, as they gathered repeatedly before the great work itself or in the studio of Baccio d'Agnolo, the celebrated architect and sculptor in wood, who was then supervising so many new buildings, and seems to have been very popular with them. Perugino himself, who was now sixty years old, could not stay away from Florence. He went to see what manner of work this could be by a young man of half his age, who, although only come into the vineyard of art at the eleventh hour, was receiving as much if not more recognition than he himself, who had borne the labor and heat of the day. Of course, he was charmed and over

awed. He was disappointed, however, to see not only himself eclipsed but even his disciples, and in an unguarded moment belittled the excellencies of the great work. When Raphael succeeded beyond the expectations of his master, Perugino bowed submissively to a fate which brought greater fame to the pupil than the master; but when he fancied to see greater work in an artist of another school, and this artist the one whom he knew to have little respect for the Umbrian school, he was filled with anger, and turned his back upon the city of the lilies. Of course, Perugino's action against Michael Angelo drew Raphael finally away from this greatest of draughtsmen. But though there was estrangement of person there could never be estrangement of ideas. Raphael was too great not to appreciate the excellencies of Michael Angelo, and with all the characteristics of a genius he gave back in his own work whatever a study of the "Bathing Soldiers" had taught him. There appears from this hour in Raphael's paintings a new force of draughtsmanship such as only Michael Angelo had hitherto displayed. The same excellencies appear in the new adept; but the work itself has grown; it has fuller forms, richer charms. Michael Angelo's art had shown the manliness of beauty; Raphael brought a higher type—the fullness of beauty in its refined feminine form.

To this perfection of form unto which Raphael attained under Angelo's influence must be added the marvelous improvements he made in his coloring and grouping. Whatever may have been the measure of inspiration he drew from Masaccio's work, it was left to Fra Bartolomeo, "the painter of devotion," as this distinguished ascetic artist is frequently called, to bring Raphael to their greatest excellence. The death of Savonarola in 1498 had so shocked his devoted friend and admirer, Fra Bartolomeo, that he threw down the brush in disgust and retired to the quietness of monastic life, to see and know no more of this wicked and cruel world. Raphael sought him out in the convent of San Marco, and won him back to society. The boon thus conferred on the world brought its benefits also to him. An intimate companionship sprung up between these two artists. They worked and studied together. They compared and discussed each other's merits and defects. Raphael gave to the worthy *frater* a better knowledge of perspective, and he in turn communicated to Raphael all he knew of the treatment of color and of the secret of symmetrical yet free grouping, and infused probably into Raphael that devotional spirit which appears to breathe so freely from all his paintings. Possibly the *fater's* influence may still be seen in the "Madonna del Baldacchino." The Virgin is on a high and canopied throne, pressing to her heart the holy child, who looks down on St. Peter and St. Bruno and other saints. It was ordered by the Dei family for their chapel in the church of San Spirito, but was not finished. Napoleon carried it away in 1798, and gave it to Brussels, whence it was restored to the Pitti Palace after 1815.

What a marvelous change these few years of study in Florence had wrought in Raphael! The spiritual mysticism and sweet unearthly devoutness of his earlier years had yielded to a brilliant realism and a fascinating display of color. The practical theories of the Tuscan valleys, peopled with busy myriads, foremost in the arts of luxury and culture, and exulting in civic splendor, had triumphed over the solemn unworldliness of the Umbrian Mountains, standing in the dim light which emanated from Assisi. The pallid and nun-like faces of Raphael's earlier Madonnas had been replaced by types of a higher earthly beauty, in whom natural affection often overflowed religious devotion, and the Virgin seemed to look upon Jesus as her beloved child rather than as her Divine Lord. The breezy landscapes and warm blue skies of his earlier works had been metamorphosed into elaborate architectural environings and richness of costume. The Syrian rustic had become a Florentine patrician. The dry Peruginesque reverence had passed away; but a new element had been added, appealing more surely to the universal human heart.

In April, 1508, Raphael wrote to his uncle, the friend of his boyhood, Simone di Cearla,

giving some details of his achievements and prospects, and asking from the new Duke of Urbino a letter to the Gonfaloniere, by whose aid he desired to secure work in the Palazzo Vecchio. It seems that the young aspirant now wished to measure strength with Leonardo and Angelo on the very ground of their triumphs. Leonardo was in his fiftieth year, and Angelo in his thirty-third; and both stood at the zenith of their fame. Raphael was only a youth of twenty-five Summers; so far their inferior in age, that it was not thought by either of these artists that he could earnestly intend to enter into competition with them. But the art public, not only of Florence and Perugia, but of all Italy, accorded to him a place beside these great masters, and discovered in him the one who should one day be greatest of them all. At Rome especially Raphael's merits were frequently discussed, and the holy father finally became so deeply interested in the youthful artist, that he decided to have him at his court. Perhaps the Duke of Urbino had used his influence for Raphael at the Vatican; perhaps the pope had seen and admired his works while at Urbino; perhaps his kinsman, Bramante, the papal architect, wished him in order to better his own fortunes and gain the services of so great an artist, and so excellent a rival of Angelo. Enough that Raphael was summoned to

THE MADONNA OF FOLIGNO.

Rome about the middle of the year 1508 to complete the decorations of the Vatican which had been begun under the previous pontificate and left unfinished.

It was in the Summer of 1508 that Raphael entered Rome for the first time. He found the pontiff seeking glory not only in politics, but also in the fine arts. The great architect Bramante was busy planning the new basilica of St. Peter. Michael Angelo, whose renown was then as a sculptor rather than as a painter, had been called about 1506, shortly after the holy father's accession to power, and was busy with the monument or mausoleum this ecclesiastic prince desired for himself. Raphael came to make up a trio of the world's greatest artists. He was to represent painting even as the other two severally represented architecture and sculpture. It is said that Julius II refused to take possession of the apartments which his predecessor, the corrupt and shameful

THE SCHOOL OF ATHENS.

Alexander VI had inhabited. "Even if the portraits on the walls were effaced," said he, "the walls themselves would remind one of that Simoniac, that Jew." He therefore chose those apartments in the upper story of the Vatican which had been occupied by Nicholas V and Sixtus IV. Raphael was called to decorate these state chambers of the new pontiff.

He began his work in the Stanza—that is, a room or hall—of La Signatura, the judicial assembly; and in the wonderful series of designs which emanated, as it were, without effort from his mind the whole intellectual world recognized a depth of spiritual meaning absolutely unsurpassed. This composition is a very poem in color; his subject, Theology, Poetry, Philosophy, and Law. His mind rose above the subjects of pagan mythology, which his predecessors had brooded over. He naturally and consistently, with the views of the time, chose to produce a composition which should represent the different religious and philosophic views of his generation. Hence, the "Stanza della Signatura" might be termed the Hall of the Faculties, for by theology, philosophy, poetry, and jurisprudence Raphael has represented all the sciences which enable man to approach the divine truth. In four circles he painted on the ceiling four figures enthroned in the clouds, with befitting symbols and attendant genii. Of these the figure of poetry is distinguished by superior grandeur and inspiration. Beneath these figures, and on the four sides of the room, he painted four great pictures, each about fifteen feet high by twenty-five feet wide, the subject illustrating the four allegorical figures above.

Under Theology he placed the composition generally known by the title of "La Disputa," that is, the argument concerning the Holy Sacrament. In the upper part is the heavenly glory, the Redeemer in the center, beside him the Virgin mother. On the right and left, arranged in a semicircle, patriarchs, apostles, saints are seated—all full of character, dignity, and a kind of celestial repose befitting their beatitudes. Angels are hovering around. Four of them, surrounding the emblematic dove, hold the Gospels. In the lower half of the picture are assembled the celebrated doctors and teachers of the Church—grand, solemn, meditative figures; some searching their books, some engaged in "colloquy sublime," and on each side a little lower, groups of disciples and listeners, every head and figure a study of character and expression, all different, all full of nature, animation, and significance; and thus the two parts of this magnificent composition, the heavenly beatitude above, the mystery of faith below, combine with one comprehensive whole.

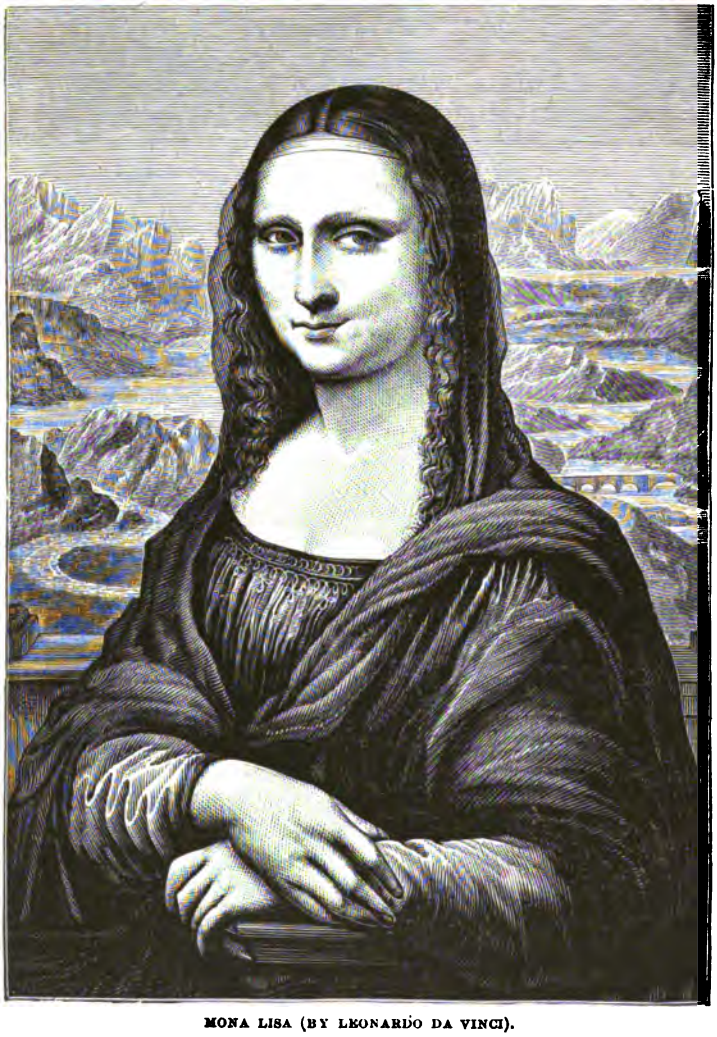
Under Poetry we have Mount Parnassus. Apollo and the muses are seen on the summit; on one side, near them, the epic and tragic poets. Below, on each side, are the lyrical poets—Petrarch, Sappho, Corinna, Pindar, Horace.

Under Philosophy, Raphael has placed "The School of Athens." It is illustrated in this article, and the reader will notice that it represents a grand hall or portico, in which a flight of steps separates the foreground from the background. Conspicuous and above the rest are the elder intellectual philosophers, Plato, Aristotle, Socrates—Plato characteristically pointing upward to heaven; Aristotle pointing to the earth; Socrates impressively discoursing to the listeners near him. On a lower plain we have the sciences and arts, represented by Pythagoras and Archimedes, Zoroaster and Ptolemy, the geographer; while alone, as if avoiding and avoided by all, sits Diogenes, the cynic. The conception of this picture was daring and without precedent, and combines high poetic inspiration with remarkable precision of idealized portraiture. Passavant calls it "the most magnificent work the master ever produced." It is the one work of the sixteenth century which best unites all the qualities of what is known as the grand style—the welding into one inseparable whole of the true and the ideal—a style created by Da Vinci and Angelo, but brought to its fullest perfection by Raphael.

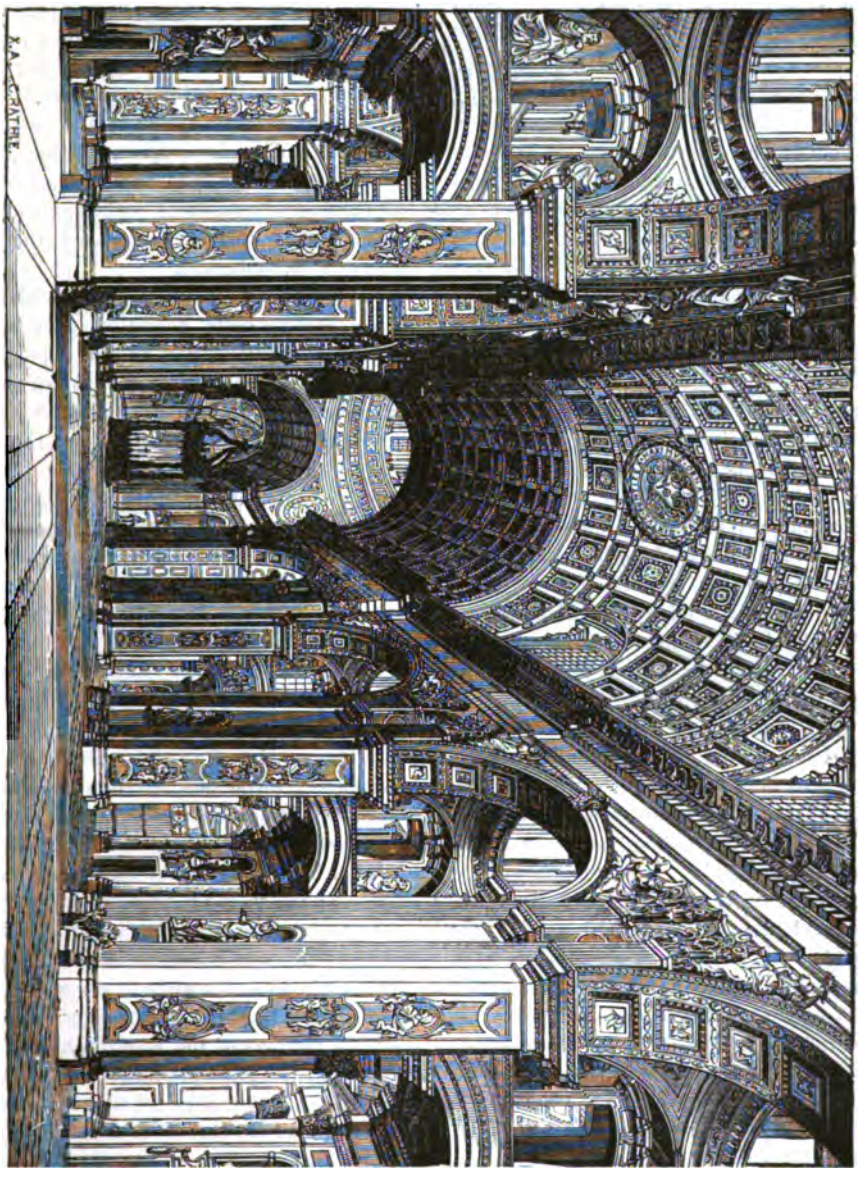
Law or Jurisprudence, from the particular construction of the wall on which it is painted, is represented with less completeness, and is broken up into divisions. Pru-

dence, Fortitude, and Temperance are above; below, on one side, is Pope Gregory, delivering the ecclesiastical law, and on the other Justinian promulgating his famous code of civil law.

The whole of this vast series of compositions was completed in three years. The date, 1511, beneath the Parnassus is that of the conclusion of the work. "And when it was done," says Vasari, "the pope expressed his great satisfaction with it to the artist." Of course, Raphael had much assistance in the work. But he possessed the power of so entirely imbuing his pupils with his own spirit that the keenest critics are sometimes puzzled to decide where he resigned the brush to one or another of those under his superintendence. Ruskin says that in this hall the artist "wrote upon the walls the 'mene, tekel, upharsin' of the art of Christianity. And from that spot and from that hour the intellect and the art of Italy date their degradation." But the mind that remains unprejudiced by the quaint conceits of Anglican mediævalism, as Sweetser truly says, must rejoice at the emancipation of Raphael and his successors from the former traditions of the epoch of the dawn of art, and their advance into the realms of higher beauty. Standing like a rock in the midst of the downward current of materialism and pseudo-archaism in art, Raphael refused to yield to the fascinations of these corrupting influences, and contented himself with a close and profitable study of pure antiquity without sinking into base imitation and servility. He blent the art-ideals of the Church with the triumphant theories of the Greek sculptors, and thus conveyed "the golden treasure of the Christian spirit into the silver vessels of antiquity." "With us art-indigents of later times," comments Dr. Springer, "satisfaction is intensified to almost boundless admiration." "We are, of



MONA LISA (BY LEONARDO DA VINCI).



INTERIOR OF SAINT PETER'S, ROME.

course, aware," he adds, "that Raphael had not yet attained to his fullest development, and that his power was still on the increase. We shall meet with other works by him characterized by even loftier flights of imagination, richer diversity, and more translucent purity of form; but for all that the pictures in the Stanza della Signatura will ever have for us a special charm. They glow with the luster of a great century and speak to us with the voice, not only of the artist, but of each one of the great men who made the Renaissance the brightest Sabbath in the history of humanity."

Face to face with Raphael's frescoes we recognize the sympathy which binds together the master spirits of all ages, and we are compelled to bow our heads before the com-

bined power of all ancient and modern thought.

The inexhaustible genius of Raphael gave birth to innumerable master-works during his stay in Rome. The mere enumeration of them appears formidable. Every day found him busily at work, painting not only for his sovereign patron, but for others as well. Cinelli, in his "Bellezze di Firenze" (edit. 1677, p. 277), mentions the following anecdote: "Raphael of Urbino had painted for Agostino Chigi, at Santa Maria della Pace, some prophets and sibyls, on which he had received an advance of five hundred scudi. One day he demanded of Agostino's cashier the remainder of the sum, at which he estimated his work. The cashier being astonished at the demand, and thinking that the sum already paid was sufficient, did not reply. 'Cause the work to be estimated by a judge of painting,' replied Raphael, 'and you will see how moderate my demand is.' Giulio Borghesi, the cashier, thought of Michael Angelo for this valuation, and begged him to go to the church and estimate the figures of Raphael. Possibly he imagined that self-love, rivalry, and jealousy would lead the Florentine to lower the price of the pictures. Michael Angelo went, accompanied by the cashier, to Santa Maria della Pace, and as he was contemplating the fresco without uttering a word, Borghesi questioned him. 'That head,' replied Michael Angelo, pointing to one of the sibyls, 'that head is worth a hundred scudi, and the others not less!' Some who witnessed this scene related it to Chigi. He heard every particular, and, ordering in addition to the five hundred scudi for five heads, a hundred scudi to be paid for each of the others, he said to his cashier: 'Go and give that to Raphael in payment for his heads, and behave very politely to him, so that he may be satisfied; for if he insists on my paying also for the drapery, we should probably be ruined.'"

It was for this Chigi that Raphael painted his "Galatea," in the Farnesina villa about 1513. It represents the goddess of the sea borne over the waves in her shell; tritons and nymphs sporting joyously around her; amorini discharging their arrows appear in the air like angels of glory. This allegorical representation of the superiority of spiritual over material happiness is a conception full of poetic feeling and instinct with life and action. The painting is a demonstration of Raphael's classic growth. Abandoning religious motives he approached in this work with his usual success the antique and mythological.

The wonderful results Raphael achieved in the Stanza della Signatura gave such pleasure and satisfaction to the pope that all the pictures of the various masters already painted in his apartments were ordered to be effaced that Raphael might replace them by his own unrivaled genius. This extensive undertaking, which it was for him alone to plan and execute, he appears to have formed into one general design—the triumph of the Catholic religion, its divine authority, and the dependence of human laws on its pervading influence.

Passing then from the rooms now called the Stanza of Raffaello, in honor of his work, and past a grand hall dedicated to the Emperor Constantine, we enter a stanza which exhibits four miracles—two from sacred history and two from the legends of the Church. The overthrow of Heliodorus in the temple of Jerusalem, and St. Peter's delivery out of prison; the rout of Attila and his army by the preternatural appearance of St. Peter and St. Paul, and the consecrated wafer at Bolsena bleeding to testify to the real presence. When Raphael is spoken of as a colorist the pictures of the Expulsion of Heliodorus and the Mass of Bolsena are usually referred to. They are called the most richly colored frescoes in the world, and have been preferred to the best works of Titian or Andrea.

Julius II died February 22, 1513, but the event did not for a moment interrupt Raphael's labors in the Vatican. Giovanni di Medici, second son of Lorenzo the Magnificent, just returned from his conquest over the recently revived republic of Florence, took the pontifical chair as Leo X. He was very like his father, but very unlike his elder brother, Pietro, whom the Floren-

A MADONNA, BY CORREGGIO.

tines had driven from their city in disgust. He was a man of resolute will and much energy. He showed this in the manner in which he had set aside the good government of the people and reacquired for his family the rule of the Tuscan city after they had been ousted from it for over eighteen years. To be sure, it was the mere fastening of the Romish fangs on its prey, a conspiracy of priest and soldier, that detestable and ominous combination more baneful to humanity than any other of the poisonous mischiefs compounded out of its evil passions and blind stupidities. But Leo X was also a Medicean patron of learning and art. There never was a greater galaxy of wit, learning, and culture gathered within the walls of any palace than graced the Vatican, nay, the entire city of Rome during the years of Leo's pontificate, from 1513 to 1521. He was fond of splendor, luxury, and magnificence, and so passionately loved art that he strove in every way to enhance its interests and glory.

Raphael was allowed to go on with his work, and most generously supported, and in two years he finished the frescoes of the Heliodorus. In his third of these mural paintings, "Attila repulsed from Rome" by Pope Leo I, he illustrated the legend that when Attila was leading the Huns against Rome in A. D. 452, St. Leo rode forth to meet him, warning him to beware of the fate of Alaric, who had offended St. Peter by plundering his holy city. At this juncture St. Peter and St. Paul appeared in the clouds waving flaming swords, which so terrified the barbarian king that he hastily concluded a peace, and led his army out of Italy. In the center of the picture the fear-stricken Attila is seen riding a fiery black horse, while his savage hordes are filled with dismay, the trumpets are sounding retreat, and the armor-clad horses are neighing in terror; with the brilliant apparitions above, and a wild hurricane raging on the plain. To this scene of pain and confusion approaches the calm and dignified St. Leo

riding on a white mule, and surrounded by plump cardinals and prelates. This is one of the best frescoes of the master, both in richness of color, accuracy of drawing, pic-

PSYCHE RETURNING WITH THE VASE.

turesque grouping, and powerful execution. Leo X had his own portrait painted for the victorious pope, in allusion to the recent expulsion of the French from Italy, when the troops of the league, formed by Rome, Henry VIII of England, Maximilian of Austria, and Ferdinand of Spain, defeated the armies of France in several battles, and Colonna destroyed their Venetian allies at the battle of Vicenza. The last of the Heliodorus frescoes was "The Deliverance of St. Peter," which is in three sections. The first shows the aged saint in prison sleeping between two mediæval men-at-arms, with a shining angel appearing to free him; in the second the angel leads the awe-stricken Peter through the slumbering guards; and in the third the alarmed soldiers are waking. The first two are lit up by the resplendent angel, and the third by a torch and the young moon, giving a novel and effective variety of lights reflected from armor and relieved by deep shadows, which excited great praise in Italy. The covert allusion to this fresco was to the wonderful escape of the new pope when he was taken prisoner by the French army at the battle of Ravenna.

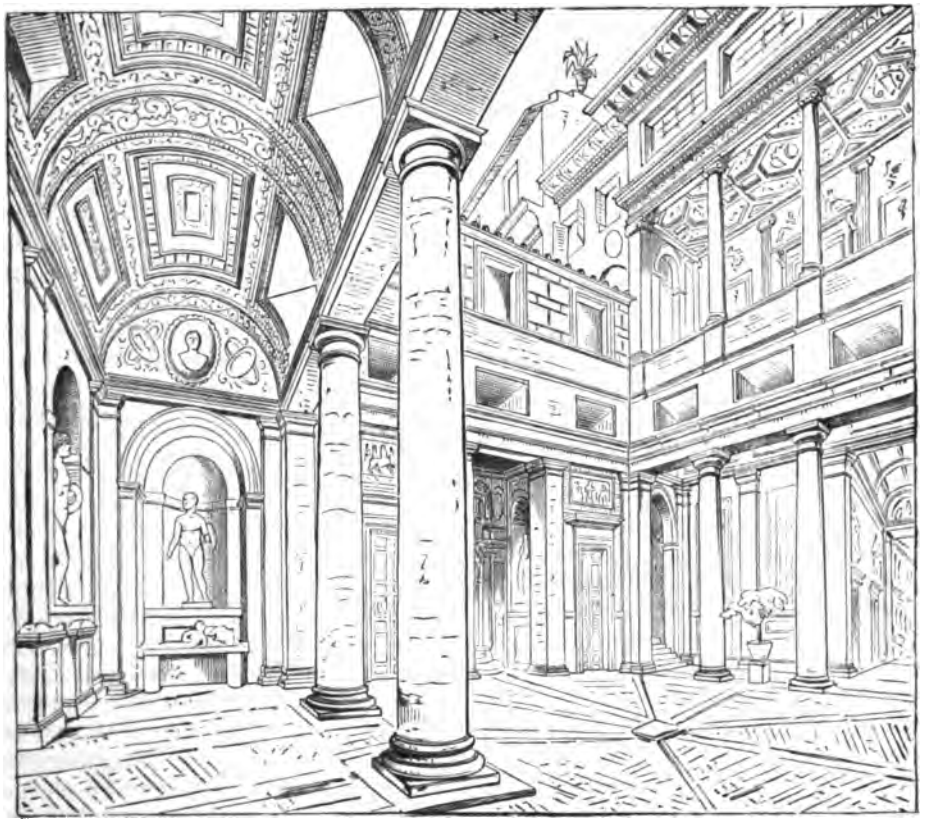
La Stanza del' Incendio was the third hall in which Raphael labored. It takes its name from the third fresco in the series, representing a fire in the Borgo—a newly built quarter of the city, near the piazza of St. Peter's—which was extinguished through the intercession of the pope (Leo IV) in A. D. 847. We behold here for the first time a direct effort to rival the manly vigor of Angelo's draughtsmanship. There are more undraped figures in this picture than in any other by Raphael's brush, and it is significant on this account. The historic allusion is to the devouring flame of war which menaced Italy in 1515, after Francis I had defeated the Swiss allies of Milan at Marignano, slaying fifteen thousand of their soldiers. The diplomacy of Leo X then saved the peninsula from further invasion. Indeed, the theme for celebration in the whole series—the other three represent the Victory over the Saracens at Ostra, the Oath of Leo III, and the Coronation of Charlemagne, together with the grand battle of Constantine at the Milvian bridge, which he later designed for the stanza named after that great Eastern emperor—was the era of the glory of the papacy, and its victories over all adversaries.

The work of the Incendio Stanza was finished in 1517;—a most remarkable year this in the history of the Church, aye, of civilization. In a little university town, yonder up north by the river Elbe, an Augustinian monk and professor of theology, of exactly the same age as Raphael, at about the same time, was fastening to the doors of the Wittenburg cathedral quite a different story. It was a protest of an aroused conscience against the sale of papal indulgences and the assumptions of the Romish hierarchy. The very picture which was to emblazon the walls of the Vatican with the noon-day glory of the papacy has become the landmark for the beginning of the decline of the Church of Rome.

Luther was preparing to lead the exodus

of the Gothic nations from the Roman Church. The flames of the Reformation were beginning to crackle all over Europe; the transalpine nations were seething with discontent, the Roman hierarchy working over a burning volcano which finally burst its crater, and ten years after brought about the secession of the Northern kingdoms from the spiritual control of the papacy, and the sack and destruction of the Eternal City by the imperial army.

Alongside this great work Raphael carried a hundred other obligations. He never knew rest. Once asked how he made it possible to accomplish so much, he answered promptly by neglecting nothing. He worked from principle. One of the great side undertakings of this time was the cartoons for tapestries which he designed to adorn the lower walls of the Sistine chapel, below the frescoes Michael Angelo had been painting there while he was at work in the Signatura Stanza. The tapestries from these cartoons were woven by Flemish weavers in a fabric of wool, silk, and gold; but they have been so much damaged that they give only feeble ideas of what they were meant to represent. The cartoons, however—that is, as many of them as were not cut into strips and then scattered or lost—are ranked among Raphael's most remarkable compositions, and greatly enrich Hampton Court, which possesses them.



COURT OF PALAZZO MASSIMI, BY BRAMANTE
(Containing some of Raphael's pictures).

EXTERIOR OF ST. PETER'S, ROME.

Their subjects are drawn from events in the lives of St. Peter and St. Paul. The Punishment of Elymas the sorcerer, who was smitten with blindness, a picture which we have given, portrays with such wonderful effect the sudden horror and consternation of the moment that it rivals the cartoon of the Death of Ananias, which is usually called the best of them all. The scene at the Sacrifice in Lystra (also illustrated, and, like the other engraving, taken from Lübke's "History of Art") is festive in character, and modeled closely after the antique, yet no fact of apostolic history lacks portrayal, and there is an ennobling harmony of arrangement. Quatremere de Quincy calls these cartoons "the climax, not only of the productions of Raphael, but of all those of modern painting."

About this time, too, Raphael painted several of his best Madonnas. Lübke says about fifty different paintings fall into this period. The Madonnas are first of all in importance among these works. He breathed his own life into them, and raised the purely dogmatic theme to the highest point of human freedom and perfection. Although he was never married, no artist glorified like him the happiness of the family life. Lübke says we might name fifty Madonnas, painted from his earliest youth to the last days of his life, in which he treated again and again this favorite subject. But at the same time he so varied his conception of a mother's love—the simplest and purest of all human emotions—that his paintings of this subject illustrate plainly in themselves the different stages of his own development. The child-like diffidence of the Madonnas of his earlier manner bloom out gradually into a gracefully developed maidenhood until they finally attain, in his ripest works, to the expression of a grandly free, motherly dignity, which is hallowed, however, by a mysterious charm of innocence and purity. Thus these pictures are the most humanly lovely delineations of a simple, devout family life, and yet, at the same time, without the addition of halos and gold backgrounds, more divine than all earlier Madonnas." Among the most beautiful of these is the "Virgin with the Diadem," or Virgin enthroned, now in the museum at Paris. Another noteworthy painting of a female is his "St. Cecilia," now in the Pinakothek at Bologna, which was completed in 1516. More celebrated is

the "Foligno Madonna" now in the Vatican, which was ordered by Sigismondi Conte, the papal secretary, as a thank-offering for his escape from a thunder-bolt or meteor. The figure kneeling, in front, to the right, is Sigismondi's portrait. He is presented to the Virgin by St. Jerome. On the opposite side are St. Francis and St. John the Baptist, not exactly contemporaries, but yet placed here to suit the wishes of that Church which knows no authority beyond its own want and will. The background of the figure represents the city of Foligno, whence its name. But even this excellent piece of masterly drawing, beautiful coloring, and skillful use of chiaroscuro is not really one of the *chefs-d'œuvre* of Raphael.

He reached the loftiest interpretation of this subject in the world-renowned Sistine Madonna, which was painted in 1518 for the church of San Sisto in Piacenza, and is at present the prized masterpiece of the Dresden Gallery. We are all familiar with that wonderful form, arrayed in glorious raiment borne upon clouds—a heavenly apparition, encircled by a glory of lovely angel faces. A veil flows from her head. She seems to be lost in profound thought concerning the divine mystery, which she clasps with motherly devotion; for a child is throned within her arms, whose lofty mission is foreshadowed in his childish features, while the depth and majesty of his eyes express his destiny as the Redeemer of the world. The saintly Pope Sixtus is reverently looking upward, the impressive dignity of his bearing in strong contrast with St. Barbara, who stands opposite him with lovely demeanor, her graceful head bowed, and her eyes downcast before this revelation of power and glory. The two enchanting angel boys, leaning on the lower division of the picture, give the last touch of beauty to this magnificent work. It may be said that in this picture Raphael reached the perfection of his type, humanity raised to divinity. He has here united deepest thought, profoundest insight, completest loveliness, which is and will continue to be, the apex of all religious art. His Madonnas belong to no especial epoch, to no particular religious creed. They exist for all times and for all mankind, because they present an immortal truth in a form that makes a universal appeal.

However, the very last creation of Raphael reaches the climax of dramatic greatness and powerful composition—"The Glorification of Christ upon Mount Tabor," also called the "Transfiguration," the most precious jewel in the Vatican collection. The profound insight of the artist has associated in his picture two widely differing circumstances. Above, the glorious forms of Christ, of Moses, and of Elias, floating in mid-air, afford a glimpse into the blessedness of paradise; below, a group of persons, moved by sympathetic suffering, surrounding the boy possessed by devils, embody in a striking contrast the pain and woe of earthly life. But the very glimpse of the opening heavens, and the very revelation of the eternal glory of Christ, throw a divine ray of consolation upon the night of the troublesome existence of earth, transferring doubt into a blessed, confident certainty. This his greatest work Raphael left unfinished. It seems as if he had labored while already on the way to heaven, and we do not wonder that Vasari, in his ecstasy of joy over this work by human hands, with so much of heavenly skill in it, is led to exclaim, "Whosoever shall desire to see in what manner Christ transformed into the Godhead should be represented, let him come and behold it in this picture."

Unquestionably the greatest picture in Rome, if not in the world, is Raphael's "Transfiguration." We take it for granted that our readers have often seen it in engravings before now. Let them recall the impression it must have made upon them as it did upon us when we saw it for the first time. It appeared to consist of two parts, in the upper of which Christ is seen in glory, floating in the air over the Mount of Transfiguration, with Moses and Elias, while on the mount are the three favored apostles; in the lower, the possessed child is brought to the apostles to be healed, amidst a multitude of persons. On this circumstance those shallow critics who are ever ready to carp

CREATION OF LIGHT (Fresco in the Sistine Chapel).

at what they do not understand, have grounded a censure of the picture, as comprising two separate springs of action or motives, as they are technically called. But all such criticism is at once answered, when we observe that two of the apostles below are pointing upwards to the Christ; thus interpreting the whole idea of the picture to be, that there is no healer of our human suffering but Christ himself. And this consideration immediately shows that the subject is not, properly speaking, the transfiguration as an historical fact, but "*Christus Consolator*,—Christ the Healer of Men;" that the picture is an exquisite adaptation of an event in Christ's course on earth to the expression of this idea.

Raphael fell a victim to the ignorance of his physicians, in the Spring of 1520, while busy with his greatest and last work. He was one day devoting himself to the Chigi palace, when he was sent for at court. He hastened at great speed, being impatient at the interruption, and arrived at the Vatican breathless and perspiring. In this condition he remained for some time in one of the cold and draughty halls, talking busily with the pope regarding the new works on St. Peter's Church, of which construction he had been placed in charge in 1514, after the death of the great architect Bramante. On his way home Raphael was taken with a violent chill, and was immediately prostrated with fever. He was bled, and instantly became so reduced that he had only time to make his will and to conform to the last offices of religion. On the night of Good Friday, April 6, 1520, he died, at the age of exactly thirty-seven years. The great light of the Eternal City had gone out, and there was darkness at the Vatican and in the streets. All Rome wept. All Italy mourned. All Europe was in grief.

Raphael's personal appearance may be gathered from the painting by himself, now in the Pitti Palace, Florence, which represents him at the age of twenty-three. His physical frame was feeble and delicate, yet symmetrical. He was five feet eight inches high, with slender arms and chest, firmly built legs and feet, and a long well-formed neck. His head was small and shapely, with heavy masses of long, brown, curly hair, a beardless face of an olive complexion, tender brown eyes, a large and well-shaped thin nose, a round and rather long chin, finely cut mouth, with full lips, and an unbroken set of perfect teeth. His features were not regular, but agreeable, and had an expression of grace and sensibility. This delicate and flexible beauty, charming with its open sweetness, was the fair index to a soul at once gentle, chivalrous, self-sacrificing, and free from jealousy.

Raphael died wealthy. In the last years of his life he owned a palace in the city and

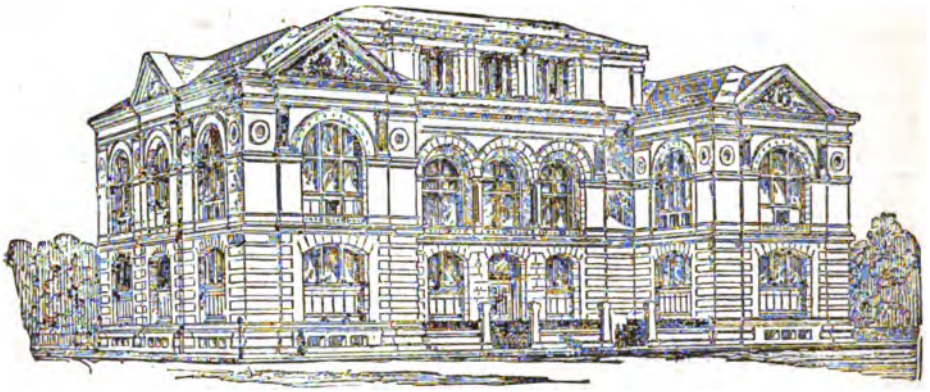
a villa beyond the walls, and was accustomed to dress richly, after the manner of the Roman court, whose urbane manners he had also made his own. Vasari says that he lived not as a painter, but as a prince. Though his carefully finished sonnets are not remarkable as poetic productions, the correspondence with Castiglione and other scholars shows that his general cultivation was of a high order.

We have no written record of Raphael's inner life, of his thoughts and sentiments, of his loves and sympathies, of his woes, joys, faith, and aspirations. The pictured halls of the Vatican compose the fair temple wherein his life-intellectual is enshrined; and, in truth, we could scarcely ask for more. It is a revelation of power and majesty and beauty, and tells us sufficient, if not all we should like to know, of the character of the inspiring genius; a genius, we should imagine, with wide and unchained sympathies, rejoicing in the glory and loveliness of nature, regarding life as a beauty and a blessing, and working out the poem of existence with the faith of a lofty soul, and the love of a generous heart. Were it otherwise, indeed, there would be no existent harmony between genius and its productions, and from these productions the true spiritual essence of mental character is best shadowed forth. It will be said, that base and unworthy men have often thought and acted aright. Yes, but not uniformly. The works of such may be brilliant with coruscations of genius, but they will assuredly be deficient in that steadfast, shining light which can alone exist when the whole being moves in sweet concert with the universal harmonies.

Raphael and Rome are synonymous terms in the history of Italian art of the sixteenth century. Though Michael Angelo labored at Rome, and the impress of his genius is every-where in the avenues of Roman art, yet by common consent the Roman school of art owes its origin and life to Raphael. It became the grandest of all the Italian schools of painting, and gave concrete reality to the aspirations and longings of his predecessors by carrying art to a height all but ultimate. The Roman school combined the virility and boldness of Florence, with the simplicity and the devotional sweetness of Umbria and Siena; in short, all Italian excellences Raphael gathered in his Roman creation; but with the artist who gave it birth, the school alone can be identified, and, illustrious as were many of his pupils, his own death marks the fading hour of the Roman school. Of all the Roman painters, it was Raphael alone who made his works not less the expression and measure of all the knowledge, philosophy, and poetry of his time than witnesses to his genius and vouchers for what we call the immortality of his fame. He achieved the labors of a demigod; his successors wrought like mere men.

FRESCO IN THE SISTINE CHAPEL.

LENOX LIBRARY.



VIEW OF THE LENOX LIBRARY.

COMPARATIVELY little has been said or is known of Lenox Library, for the reason it has been but recently opened to the public, and is situated remotely from the main centers of New York City. It was for many years the private property of James Lenox, Esq., who made the rare collections it contains a life-work of over forty years. The building, in point of architectural beauty, value, and design, is superior to any library building in the United States; the collections of books and papers entirely unlike those of any other library.

The paintings and sculptures were exhibited for the first time in January, 1877, when the whole magnificent gift was presented to New York, but to be opened only twice a week. In the construction of this building and the arrangement of its valuable contents, Mr. Lenox had excellent excuse for the exclusion of the general public. Great skill and judgment was required to perfect the systematic arrangement of such a stock, and a different ability than that needed in shelving and cataloging an ordinary library. The Lenox collection required double the time so to arrange it that a Peabody or mercantile library would demand. The strictures of the press fell heavily upon the donor at the time, but his judgment is now generally commended by all who fully comprehend the value of the gift, and the necessity for perfection in its arrangement which time alone could secure.

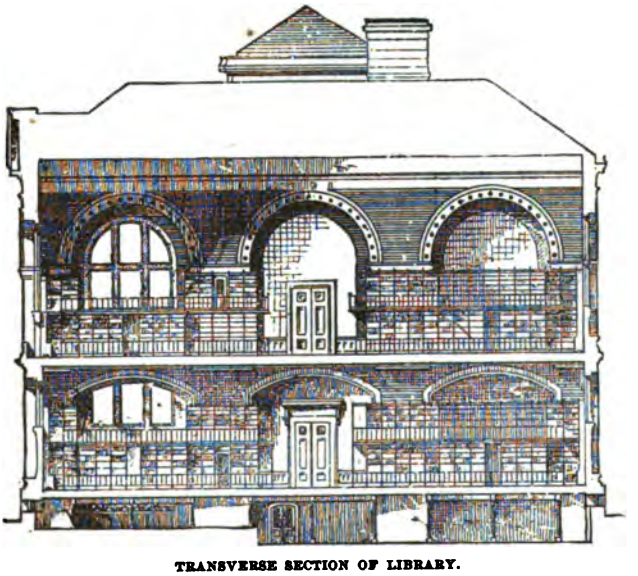
The building is of Lockport limestone, closely resembling granite, constructed at a cost, with its furnishing, of $1,200,000. It is also endowed with a permanent fund of a quarter of a million of dollars. Built upon ground given by Mr. Lenox, it occupies a commanding site on Fifth Avenue between Seventieth and Seventy-first Streets, overlooking Central Park, Hudson River, and shores and heights of Jersey beyond. It has a parallel frontage on Fifth Avenue of one hundred and ninety feet, and a depth on each street of one hundred and fourteen feet. The entrance plan is a court and massive gateways; while there are no carved figures, scrolls, or fanciful ornamentation of any kind, its imposing, massive richness and architectural solidity commands the greatest admiration. In its elegantly finished blocks of stone, the columns, cappings, bases, and casings there is an appearance of poise and substantial dignity that impresses all visitors. The vestibule, which is entered directly from the entrance door, is twenty-four by ninety-six feet in area, from which all portions of the building are accessible. This grand vestibule is designed to serve a double purpose, both as vestibule and sculpture gallery. Nothing but marble, stone, and tiling greet the eye—the floor is laid in purest

white marble tiles, and the walls skirted by marble bases of a smoked-pearl tint of great delicacy.

The library and reading-rooms of the first floor, or first story, occupy the north end of the vestibule, and are one hundred and eight feet in length, having six recesses opposite each side window. These beautiful rooms are seventy-four feet high, with level ceilings elegantly corniced and paneled. Here are the mosaics, porcelains, enamels, and casts, numbering sixty rare subjects, embracing collections of Florentine, Munich, Dresden, Berlin, Sevres work, with medallions of great value from the best artists. The cases for books, autographic letters, etc., are of the finest glass, framed in black iron mountings. The beautifully stained windows, ten feet above the floor, throw upon this grouping of glass cases and their rare contents the prismatic shades of softened colors.

Among the choice autographs are original letters from Oliver Goldsmith to David Garrick, dated 1767. Also from Robert Burns to "Clarinda," others from Oliver Cromwell to John Cotton, bearing dates of 1651, and from Sir Walter Scott to Bishop Perley in 1800. Among the most interesting works in open display in glass cases are first and only copies of the Bible—one printed in 1450, at Mainz, the first complete printed book known; a large folio Latin Bible, printed in Nuremberg by Koberger in 1477; and every known edition of Bunyan's "Pilgrim's Progress" and Milton's "Paradise Lost." There are also several copies of the "Doctrina Christiana," the early product of the Spanish Catholic press in the city of Mexico. In manuscript copies of the Bible, both on vellum and paper, there are several beautifully illustrated editions belonging to the twelfth, thirteenth, and fourteenth centuries. The first book printed within the territory of the United States, bearing date "Cambridge, 1640," a Bay Psalm-book, is one of the most valuable of the American collection. Homer in Didot's microscopic types, printed in Paris 1528, is a rare work, also a Homer printed in Florence in 1488. There are fifteen earliest editions of Shakespeare—the "Golden Legend" of 1484 being the original edition. The Game and Play of Chess, printed 1475, embracing thirteen volumes, is a most interesting work. A large collection of Polyglot Bibles, printed in 1645, also "Der Weiss Kunig," a rare work, embodying the history of the Emperor Maximilian, introducing illustrations of the costumes of the Middle Ages. The Mohawk Indian Prayer-book printed in New York, 1715, is a volume of much interest.

Block books, printed from movable wooden types, the first used, a combination of manuscript and xylography, a letter of Columbus's, giving accounts of his discovery of America, published in 1497, are found among the numerous attractive relics which Mr. Lenox was so many years collecting.

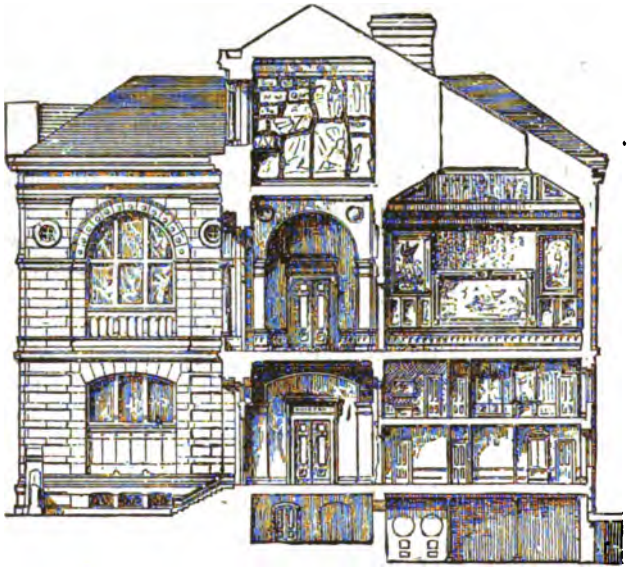


TRANSVERSE SECTION OF LIBRARY.

Of the great mass of choice collections those mentioned constitute but a few of the general classes or features of the first floor library rooms. The marble pedestals in the

vestibule are surmounted by busts of Caracalla, emperor of Rome, and of Julia Pia, mother of Carcalla, both were purchased in Rome in 1856.

The main stairways, situated at the north and south ends of the vestibule, lead by easy ascent to the half and second story landings. These stairs are of beautiful stone



TRANSVERSE SECTION OF GALLERY.

of peculiar construction, the balustrades are of iron scroll-work of most elegant workmanship. The platform landings are of solid stone, supported by arches of carved stones. The idea of solidity and beauty combined is fully carried out in every detail.

The merranine, or half story, is finished in apartments for the superintendent, being in the main office, parlor, dining-hall, sleeping and service rooms.

From the second story landings two doors open into the main gallery, ninety-six feet long, parallel with Fifth Avenue, and directly over the entrance hall on the first story. From the three ample windows, the park, always beautiful in dress of green or snow, the Hudson, and the heights beyond of old Jersey are in full panoramic view. The sides of this fine gallery are divided into five arcades decorated with pilasters and niches. The walls are wainscoted in solid oak; at the south end is located the second story library, and the middle portion is a grand entrance to the dome-shaped picture saloon, which is forty by sixty feet, lighted by oval sky-lights, and the ceiling graduated down from them to the cornices, encircling the four sides of the room without a break. Architectural taste is gratified in contemplating the art and picture saloons of this building. The appointments so simple, and yet so indicative of richness, and the utilization of light and shade for the grouping of so much rare skill and beauty commend the arrangement to high praise. Of one hundred and fifty pictures less than fifty are from the easels of American artists. It was over forty years ago that Mr. Lenox purchased his first and best paintings. Some of them have the appearance of age and hardly sustain the evidence of best artistic skill.

Among the best are those from Sir Joshua Reynolds, Charles Leslie, and Gilbert Stuart. The "Dog in a Stable," by Sir Edwin Landseer, for which the artist received a medal from the Society of Arts in the Adelphi, London, was bought in 1860. "The Valley Farm," is John Constable's, of which much was said in Leslie's Memoirs. The original portrait of John Bunyan, and one of Washington, painted by Peale in 1778, are fine works that enrich the collection very prominently. A portrait of Washington Irving by Leslie and Francesca by Herbert are gems of art. "Market Scene in Holland," "The Pharisee and Publican," "Tobit and the Angel," belong to a school of studies, which they illustrate with marked fidelity. The pearl of the Lenox collection is in the fifteen marbles that occupy the second story gallery devoted to sculpture. Thomas Crawford has two subjects, bust of Washington, purchased from the Ward estate, and "Children

in the Wood," modeled and executed in Rome in 1854. This is one of the finest pieces of sculpture to be seen in the United States. The following stanza explains the position and attitude of the figures:

> "Thus wandered these poor innocents,
> Till death did end their grief—
> In one another's arms they died,
> As wanting due relief."

The quaint phraseology that indites the sentiment is tenaciously preserved by the artist of this exquisite study.

"La Penserosa," by Hiram Powers, standing upon a high pedestal, is the object of divers criticism; the finish and tone are excellent, the figure perfect. Many, with less appreciation than candor, have unwisely ridiculed this valuable statue. When young American taste is schooled in art, as well as it is in coarse fiction, they will be better able to pass judgment upon one of the most exquisite and meritorious sculptures ever produced by a master artist.

"Highland Mary," by Benjamin E. Spence, is one of the best in the entire collection. Among the busts are those of Napoleon, Lincoln, Walter Scott, and Washington. Among these fifteen subjects is rich food for artistic study that would occupy one for weeks, insuring a constant gratification of all the higher senses. A day at Lenox would be time well spent for old and young, and the gift to New York has no estimated value; it passes beyond the value of dollars and cents.

THE SABBATH DAY.

FRESH glides the brook and blows the gale,
Yet yonder halts the quiet mill:
The whirling wheel, the rushing sail,
How motionless and still!

Six days stern Labor shuts the poor
From Nature's careless banquet-hall;
The seventh, an angel opes the door,
And smiling, welcomes all!

A Father's tender mercy gave
This holy respite to the breast:
To breathe the gale, to watch the wave,
And know the wheel may rest!

Six days of toil, poor child of Cain,
Thy strength thy master's slave must be:
The seventh, the limbs escape the chain—
A God hath made thee free!

The fields that yester-morning knew
Thy footsteps as their serf, survey;
On thee, as them, descends the dew,
The baptism of the day.

Fresh glides the brook and blows the gale,
But yonder halts the quiet mill;
The whirring wheel, the rushing sail,
How motionless and still!

So rest—O weary heart!—but, lo,
The church spire glist'ning up to heaven,
To warn thee where thy thoughts should go
The day thy God hath given!

Lone through the landscape's solemn rest,
The spire its moral points on high—
O soul, at peace within thy breast,
Rise, mingling with the sky!

They tell thee, in their dreaming school,
Of power from old dominion hurled;
When rich and poor, with juster rule,
Shall share the altered world.

Alas! since Time itself began,
That fable hath but fooled the hour;
Each age that ripens power in man
But subjects man to power.

Yet every day in seven, at least,
One bright republic shall be known:
Man's world awhile hath surely ceas'd,
When God proclaims his own!

Six days may rank divide the poor,
O Dives, from thy banquet-hall—
The seventh the Father opes the door,
And holds his feast for all!

JULES FAVRE.

ON the morning of the 26th of July, 1830, the city of Paris was, thrown into consternation by the appearance in the columns of the *Moniteur* of the celebrated "five *ordonnances*" of Charles X. They respectively suspended the liberty of the press, dismissed the newly elected Chamber of Deputies (containing a two-thirds majority for the opposition), proclaimed a change in the system of elections, convoked a new Assembly, and presented the nominations of some extreme royalists to the Council of State. Before sundown the most prominent journalists and publishers, headed by a wiry little man, the editor of *The National*, met in spirited assemblage. The fiery editor drew up and read a bold and strong protest against this flagrant violation of their constitutional charter. "Print it!" shouted the hearers. "Print it unsigned?" he replied. "We want names and heads at the end of such a document. In straits like these a patriot should feel that he has no alternative but the guillotine or victory." It was signed by forty-three names, and printed the next morning. All Paris was in arms, and thus began the Revolution of 1830, which gave the Bourbon power a blow from which it has never been able to recover. The author of the famous editorial: "The king reigns, but does not govern," at the end of the brief revolution issued a proclamation which resulted in the transfer of the crown to Louis Philippe, Duke of Orleans. But among the insurgents who resisted this *coup d' état* of Charles X there might have been seen two other less prominent, but none the less brave, combatants. One, a young law student, taking down a rusty musket from the wall of his chamber, gallantly stormed the Babylon barracks at the head of a company of patriots. The other, likewise engaged in the study of law, threw himself with equal zeal into the thickest of the fight.

It is needless to say the three men were Thiers, Grevy, Favre. In the galaxy of French statesmen no names shine with a brighter luster. After the lapse of nearly half a century we find these stars in conjunction again. In the extremity of the nation, when the empire had collapsed, and the heart of France was exposed to the batteries of the Prussian army, Jules Favre and A. Thiers were the two men who, by their patriotic wisdom, moderation, and skill, rescued

the destinies of the nation. When the new republic was organized, after the close of the war of 1870–71, M. Thiers became its almost inevitable first president, and when MacMahon was forced to relinquish the post before the expiration of the septennate, none was thought to be so worthy of succeeding to the presidential chair as M. Grevy, the present incumbent.

But it is to M. GABRIEL CLAUDE JULES FAVRE, who died only recently, that special attention is invited in this article. He was born March 21, 1809, in the city of Lyons, and was, therefore, of the same age as Jules Grevy. In the early career of these two men there were several singular coincidences. They were both reared in moderate circumstances, and, as we have seen, simultaneously engaged in the study of the same profession, in the same city, at the same age. Receiving the same political baptism in the Revolution of 1830, they also found themselves impelled into the same political channel in the practice of their legal profession. But in the espousal of the cause of popular rights, particularly in the defense of political offenders, Jules Favre achieved the greater fame. Returning to Lyons after the completion of his law studies, he at once distinguished himself by an eloquent defense of a society of working men, prosecuted for illegal association. His fiery appeals for liberty and justice led to a bloody conflict in the streets of his native city, in which he joined, but escaped punishment. The fame thus acquired brought him back to Paris in 1834 to defend the accused working-men that were under prosecution at this time. He opened his celebrated speech before the chamber of peers with the famous declaration: "I am a republican." But his eloquence was not sufficient to save his beloved clients, and his disappointment and grief were so keen that he retired wholly from public affairs. But after a few years he was again boldly advocating the cause of freedom at the bar and through the press. As political editor of *The Movement*, though its existence was but short, he came into closer contact with the journalistic world, and was in great demand as an advocate. Of his speeches at this time a competent critic says: "They have the ring of veritable war-cries: many are stately and dignified in form, full of sound sense and faultless logic, animated by a hidden fire which communicates its heat even to him who reads them from a printed page."

When the Revolution of 1848 broke out he announced his political creed in the following words: "Liberty is the free exercise of all the faculties bestowed upon us by God, governed by our reason. Equality is the participation of all citizens in social advantages, without other distinction than virtue and talent. Fraternity is the law of love, uniting men and making all members of one family." It was unavoidable that he should become a prominent figure in the events that followed. As secretary-general of the Ministry of the Interior, he was the reputed author of the ultra-radical circulars which were sent out under the signature of Ledru Rollin. But he has emphatically denied having had any share in their preparation. Having been elected to a seat in the national Assembly from the department of the Loire by over thirty-four thousand votes, he resigned his position as secretary of the ministry of the interior. In the Assembly he was in his most congenial sphere, winning increased fame by his brilliant oratory. He would not be fettered by party limits, but felt himself at liberty to act in perfect independence. The principal items in his career, down to the election of Napoleon as president, were the preparation of the report of the committee favoring the impeachment of Louis Blanc, his proposition to confiscate the personal wealth of Louis Philippe, his refusal to join in a vote of thanks to Cavaignac, and his opposition to the expedition to Rome, December, 1848. After the election of Napoleon to the presidency he became his persistent opponent. And when the *coup d' état* of December 2, 1851, was perpetrated he resumed his profession, and refused to take the oath of imperial allegiance when elected shortly afterward to the Councils-General of the departments of the Loire and the Rhone. But though out of the Assembly, a new

significance was given to his career. For it was in the capacity of an advocate that he was enabled to startle all Europe in 1858 by his bold defense of Orsini, the would-be assassin of the emperor. He embraced this opportunity of avowing with sublime eloquence his love of liberty and republican institutions. He was immediately elected to the Corps Legislatif from the sixth circonscription in the department of the Seine, and now consented to take the oath of allegiance in order to strengthen the small force of the opposition in this body. The defender of Orsini a member of the legislative body of the empire! The imperialists had good reason to fear his power. For he was as fearless in his denunciations of the shams of the empire as these were vulnerable by the sword of truth. He belonged to the celebrated group of "Five" who dared, in the legislative hall, to say to all the world that the government of Napoleon III was a "tyranny based on fraud and violence, which it was the duty of the French people to overturn." When the war with Austria broke out in April, 1859, he exposed with scathing sarcasm the insincerity of establishing liberty by force in Italy, while having violently overthrown it in France.

From this time until the breaking out of the Franco-Prussian war he was almost continually before the public in the capacity of a political opponent of the empire, being re-elected to the legislative body in 1863 both from Paris and Lyons, and choosing to represent his native city, and in 1869 from the department of the Seine. In the year previous he was made a member of the Académie Française to succeed M. Victor Cousin. His distinction at the bar was recognized in 1860 by his election as bâtonnier of the Paris advocates. In 1864 he opposed in a powerful address the Mexican expedition, by which Napoleon sought to dazzle the minds of the French people, and make capital for the empire. After the failure of this project and the success of the Prussian arms in the war of 1866, the emperor found it necessary to devise new plans for strengthening the empire in the popular estimation. Of such a nature were the proposed concessions to the liberal party in the form of constitutional changes. But they failed either to deceive or conciliate the republican sentiment. Favre and his associates covered the imperial policy with ridicule, and riddled it by their wit. There can be but little doubt that had not the Prussian war compassed the overthrow of the imperial dynasty, civil revolution would have sooner or later accomplished this result.

Of this opposition in the Corps Legislatif Favre was the acknowledged leader, especially during the months preceding the Summer and Fall of 1870. How he became the chief figure in the tumult of the 4th of September, when the provisional government was formed, constitutes one of the most interesting and important portions of later French history. Judging from his moderate and calm account of the events of this exciting period in his work, entitled "The Government of the National Defense," his mission must be regarded as having been of critical significance, and the manner in which he fulfilled it entitles him to be ranked among the greatest patriots of France. But to understand his position on the 4th of September, when he so signalized himself, we must go back a little.

On the 15th of July the Chamber of Deputies presented one of the wildest scenes ever witnessed even in a French legislative body. The candidature of the Prince Hohenzollern for the Spanish throne, which had been received by France as a menace to the balance of power in Europe, had been voluntarily withdrawn, and the king of Prussia had signified his approval of this withdrawal to the French Government. Thus every pretext of war had been removed. But at the Tuileries there was but one dream—the disgrace of Mexico must be effaced by a new exploit of arms, restoring to the imperial crown the luster it had lost. Therefore, it was demanded that the king of Prussia guarantee that this candidature should never be renewed in the future. A refusal of this was foreseen. No sooner was Benedetti's dispatch to this effect received by the minister of war than it was

hurled into the Assembly as a fire-brand, and made to serve as the text for war. By willful and persistent misrepresentations on the part of the government the passions of this body became inflamed to such a degree of intensity that all efforts on the part of the few sober minded ones to restore the majority to reason and reflection were utterly futile. "Offend me, insult me," cried Thiers; "I am ready to indure any thing to spare the blood of my compatriots, which you are ready to shed so imprudently." But all was vain. Even a resolution of Favre, requesting the communication of the dispatches upon which the supposition of an insult to the French nation was based, was lost. The demand for a loan of fifty million francs for military defense was carried at midnight by two hundred and forty-five votes to ten. War was declared on the 19th of July. Having failed to prevent this rash and sinful act, the disastrous results of which were clearly foreseen by Favre, he, with others, endeavored to secure the reorganization of the National Guards for the better safety of the nation. But in this, too, they were resisted. "There is no danger," was the answer. But the nation was soon to be undeceived. On Sunday morning, August 7th, Jules Favre was met on the Rue d' Amsterdam by a pale and haggard friend, who announced: "We are beaten; the army of MacMahon is routed. Froissard is beaten, Failly beaten. Alsace is invaded, and our first line of defense is broken."

Favre at once sought out the president of the Corps Legislatif, asking for a convocation of that body, and declaring that the safety of the country demanded the recall of the emperor, and the assumption of supreme power by the Assembly. On the following Tuesday the opposition demanded the armament of the French National Guard and the nomination of a commission of fifteen members invested with powers of governing and defending the nation. For the latter bold step the body was not prepared. It sounded very much like treason. M. de Cassagnac protested, and demanded that the authors of the resolution be brought before the council of war. The proposition of a commission was rejected by a vote of one hundred and ninety against fifty. Upon hearing the vote proclaimed, Gambetta exclaimed, "You will have to come to it;" and Favre added, "Yes, and when you do, it will be too late!" It was his belief, supported by many military men, that had the chamber seized the supreme power then, the emperor having no more orders to give, Paris would have been covered, an army of succor, a hundred thousand strong, would have prevented the occupation of Châtillon and Versailles, and thus the investment would have been impossible, or, at least, delayed. But the president of the Chamber, M. Schneider, and M. de Palikao, when called upon to choose between Paris and the emperor, sent the last resources of France to the latter. Repeated efforts were made to form a commission, but they were resisted to the end. The only concession made to public opinion was the appointment of General Trochu as governor of Paris. Meanwhile the situation was becoming daily more precarious. From August 30th to September 3d not a single dispatch appeared on the bulletin boards from the seat of war. The public suspense became intolerable. This silence could have but one interpretation: the general apprehension of defeat was confirmed. On the morning of September 3d the minister announced the defeat of MacMahon and the inclosure of the army and emperor in Sedan. Jules Favre, in a short speech, maintained that the time for complaisance had passed. France was without a head. "Where is the emperor?" he demanded. "Is he in communication with his ministers? Does he give them his orders?"

The minister of war—"No."

M. Jules Favre—"Since the reply is in the negative there is no need for me to prove by a long argument that the government has ceased to exist, and that it is of yourselves, it is of the country, you must now ask the resources which can alone protect it and you."

But the Chamber adjourned without giving any attention to these notes of warning. The news of the capitulation of Sedan and

capture of the emperor had soon followed the previous intelligence, and spread rapidly through the city. The boulevards were thronged; the police were powerless to disperse the surging crowds. Cries were heard demanding the fall of the government. The insurrection had already begun. The Chamber was convened at one o'clock Sunday morning, September 4th, at the urgent request of the opposition, headed by Favre. His testimony with regard to his private interview with the president on the night of the 3d is worthy of note. To the original plan of demanding the assumption of supreme power by the Chamber, "we only added," he says, "the deposition of Napoleon, who had signed it already by surrendering at Sedan. We were then as free from personal interest as we had been when, on the 7th of August, I had sought an audience with M. Schneider, the president. We had no other design than to accomplish without a revolution an act of justice which had now become inevitable. On this occasion, if the Chamber had voted as we requested, the insurrection of the 4th of September would have had no cause to take place, and we should have been excluded from the new government chosen by the majority." The hour appointed had arrived. The president was in his chair; but the cabinet had not thought it proper to meet. The minister of war was found in bed, and requested the Chamber to postpone its deliberations till noon, that he might have an opportunity of consulting his colleagues. The Chamber hastened to accord this delay. But then the last opportunity for action had passed.

Whatever may be thought of the important events that took place later in the day, it is certain that Favre and his associates had no part in originating the violent interruption of the Corps Legislatif by the National Guard and the mob. It was as much a surprise to them as to the other members of that body. It was only at the last moment, when all efforts at controlling the mob had been abandoned, and the president had declared the sitting at an end, that Jules Favre, impelled by a patriotic and heroic impulse, made himself master of the situation. As every step in the order of events is of significance here, we give them with some detail.

When the Assembly met, a little after one o'clock in the afternoon, the minister of war endeavored to head off the opposition by himself proposing, now, a council of government, with the Count de Palikao for lieutenant-general. Favre claimed priority for the proposition of the left, by whom, however, two propositions were now presented. The more readily to conciliate the majority, it was decided to abandon the word *déchéance*, for which M. Favre substituted the phrase, "Considering the vacancy," etc. Thiers favored a still milder substitute, "Considering the circumstances," etc. To this Favre could not give his assent, as it affirmed nothing. The three propositions were thus sent to the bureaus to be formed into a single resolution. It is important to note that these separate propositions to constitute a new government named by the Chamber, recognized that the empire was no longer in existence. And as each party, also, either demanded that a new constituent Assembly be formed, or conceded the necessity of constituting one when the immediate dangers from the presence of the enemy should have been averted, it was equally clear that the Corps Legislatif, which was the exponent of the imperial policy, could not survive its downfall.

While the bureaus were engaged in the work committed to them, the sound of a tumult in the court-yard outside suddenly fell upon their ears. The chamber had been invaded by the populace. In passing out of the room where the ninth bureau was sitting, Favre met the mob. They accosted him, and demanded the fall of the government. He responded: "We are aiming at that, but you will not help us by violently interrupting our deliberations," and used every effort to induce them to withdraw. Inside of the legislative hall but fifteen deputies were present. The president and several prominent members of the opposition successively strove to restore quiet and clear the halls. Suddenly there was a terrible

crash. The doors of the hall gave way to the crowd pressing outside. The chamber was rapidly filled with a promiscuous crowd of the populace and the National Guards, partly without uniforms, cries of *La déchéance! Vive la Republique!* filled the air. The president declared: "Deliberation, under such circumstances, is impossible. I declare the sitting at an end." When the tumult was at its height Favre, who had not witnessed the previous scenes, entered the hall. Seeing the disheveled heads of two men, who were in the highest state of excitement, and one of whom was ringing the bell loudly, preparing to propose some decree, he quickly ascended the tribune. The following are his own words: "The recollection of the 15th of May flashed across my mind. I recalled Barbe's making the mob vote foolish measures. I did not hesitate; and, feeling the full import of the steps I was about to take, I succeeded in making a few words audible in the midst of this tempest. As it was demanded on all sides that I should declare the republic, I said, 'It is not here that this can be done, but at the Hôtel de Ville. Follow me. I will go thither at your head.'" This course, which had suddenly suggested itself to his mind, had the advantage of freeing the chamber, and of preventing a sanguinary conflict within its precincts, which would have rendered a violent faction master of the movement. The proposal was received with acclamation, and Favre, descending from the tribune, led the crowd out, being joined at the door by a number of his colleagues. At the end of the Pont de la Concorde a formidable cry arose: "To the Tuileries!" But the crowd obeyed an energetic signal by Favre to pass along the quays. Having arrived at the Hôtel de Ville, Favre again addressed the vast crowd in the large hall. While he was speaking additional colleagues and deputies arrived, and retiring to a side chamber they immediately formed a commission of government. They had already been installed, when General Trochu, who had been sent for arrived, and placed himself at the disposal of the new government, on condition that they would protect the three institutions—religion, the family, and property—and constitute him president of the republic. The latter demand, if we are to believe in the sincerity of his professions, was not prompted by ambition, but based on the conviction that without being invested with supreme authority as commander-in-chief the defense of Paris could not be assured. His bold demand was acceded to without a dissenting voice, and he departed with a walking-stick in his hand to take possession of the war office.

Meanwhile the chamber, having been freed from the presence of the mob, the remaining deputies reassembled and forthwith passed a resolution very closely resembling that originally proposed by Favre, and sent a commission to confer with the provisional government just formed at the Hôtel de Ville. But these overtures, though, doubtless, animated by patriotic motives, came too late. The Assembly had refused, week after week, to take this action until forced to do so by the logic of events. The revolution of the people had already been accomplished, and Favre and his associates had, by their wise and prompt action, so controlled its turbulence that not a drop of blood had been shed in its assumption of authority. Indeed, it is not difficult to conceive what results might have followed had these wise and brave men not put themselves at the head of the popular uprising. The Commune would have established itself at the Hôtel de Ville, to be followed by civil war, division in the army, and ruin of the defense. That they were not regarded as usurpers is evident from the dignity and confidence with which they were treated by the remaining body of the Corps Legislatif. Well did these heroic leaders understand the grave perils that were impending over the country, and the responsibility they had assumed. Paris was at this moment too much intoxicated by its joy over the downfall of the empire to realize the danger from the enemy. On the evening of the 4th of September, as they were contemplating the gayety of the populace, and some one expressed his admira-

tion, Jules Simon said to Favre in a grave, sad tone: "I am thinking only of the Prussians."

The mission of Favre, after the provisional government had been formed, was as painful as it was delicate and difficult. His first acts were to draw up a circular, addressed to the representatives of France at the courts of Europe, and to secure the services of M. Thiers as special envoy to these powers. It was in this circular that he defined the position of France in the proud words: "Not an inch of our territory, nor a stone from our fortresses!" Nevertheless, it required no extraordinary foresight to perceive, that without foreign intervention the reduction of Paris was only a question of time if the war went on. The advance of the Prussian army must, therefore, be checked. This could not be done by arms. It must, therefore, be done by diplomatic negotiations for peace, humiliating as this might be. But Favre had always been an advocate of the higher and humane principles of modern civilization. He shuddered at the picture which his imagination drew of the horrors of a prolonged siege of over two millions of maddened Frenchmen. And he held that France, at large, was not responsible for the war, but the empire. As this had fallen, he argued that the offending cause of the war was removed, and, Frenchman that he was, characterized the prosecution of hostilities on the part of Prussia, after the capture of Sedan, as aggressive barbarism.

Although the provisional government was organized, as its name declared, for the national defense, and the resistance of the foreign foe, yet its vice-president and chief representative found himself under the embarrassing necessity of considering from the very first the question of peace. He entertained strong hopes that the neutral powers might unite in a demand for a cessation of hostilities on the simple condition of a sufficient indemnity for the war; but being disappointed in this expectation, he swallowed his pride, and sought a personal interview with Bismarck. They met in Carrieres on the 19th of September. In three prolonged interviews, extending over a period of two days, he exhausted every plea of humanity, political interest, and patriotism to secure terms for an honorable armistice, in which to elect a new Assembly to treat with the enemy. But Bismarck's demand of the surrender of Strassburg, and a cession of territory, as the inexorable condition of an armistice, made the efforts fruitless. At the final repetition of these severe conditions Favre was unable to control his emotions, and with mingled tears and smothered rage withdrew.

After the well-nigh successful insurrection of the Communists in Paris on the 31st of October, Thiers was selected as the agent to conduct a second interview with the enemy, with a view to securing an armistice with the privilege of reprovisioning Paris. After five days of conference Bismarck agreed to an armistice of twenty-eight days, on the basis of the military *status quo*, so as to give an opportunity for the holding of elections, but refused the re-victualing of the besieged capital. Both Thiers and Favre favored this proposition, thus furnishing a sufficient refutation of the charge that they were seeking to prolong their "dictatorial powers." But the majority of the government, influenced by General Trochu, rejected it.

Three months more of heroic resistance ensued, until a second Communistic outbreak on the 22d of January, 1871, led by Flourens, determined Favre, for the third time, to seek a truce. Aside from the growing power of the Communistic conspiracy and the difficulty of repressing internal disorders, grim, gaunt, famine was now haunting the waking and sleeping moments of thoughtful men. Invested with plenary powers by the government, he presented himself to Bismarck with the remark that he had come to begin where he had left off at Ferrières, and asked the conditions of an honorable surrender. "You are too late," responded Bismarck gruffly; "we have treated with your emperor." Notwithstanding Favre's indignation upon learning of the schemes to reinstate the imperial dynasty, the discussions continued until they terminated with an agreement on the evening of the 26th,

just as Favre was stepping into his carriage, to stop firing at midnight. On the 28th he signed an agreement for an armistice of twenty-one days providing for the convocation of an Assembly February 12th, the immediate re-victualing of Paris, and the retention of their arms by the National Guard. But he failed to secure the exemption of Paris from the entry of Prussian troops. It is safe to say, however, that hardly could another have been found to represent the interests of his prostrate country in this trying hour with greater perseverence, dignity, and self-control. The armistice was not signed an hour too soon. For upon his return to Paris he learned that four days must elapse before the provisions telegraphed for from London, Antwerp, and Dieppe could arrive. Hastening back to Versailles he confessed to Bismarck that the population was in danger of absolute starvation. It was only by drawing upon the Prussian provisions that the dreaded mortality was averted.

When the Assembly was organized at Bordeaux he was delegated by the government of national defense to hand in their collective resignation.

"When he mounted into the tribune there was a general murmur of respectful surprise among all who knew him personally, so worn and aged had he grown under the influence of the excitements and trials to which he had been subjected. He went down from the tribune like a man from whose shoulders a crushing burden had been lifted, and he doubtless would have been glad to escape from the responsibility with which he was honored in the new cabinet chosen by M. Thiers—that of holding the portfolio of Foreign Affairs."

He was prominent in measures for the suppression of the subsequent Communistic revolt, and, as minister, displayed marked discretion in managing the delicate relations between Germany and France. He was re-elected to the Assembly in 1873, and in 1876 to the Senate, where his term would have expired in 1882. But he died January 19, 1880, of pneumonia, at the age of seventy-one. That his distinction at the time of his death was not as great as when, during the years of his country's peril, he stood at the helm of political affairs is not surprising. But to say that on that account his career ended in failure would be an entire misconstruction of the place he was called to fill in the order of events. Younger statesmen, such as his warm friend Gambetta, have eclipsed him in political glory; but history will recognize the signal services which he rendered his country in the hour of her greatest disaster, and enroll him among the most conscientious, valiant, and unselfish of French patriots.

In personal appearance Favre is described as "a man above medium size, with a grave, sweet, very dignified face. His nature was sensitive, and he probably suffered a great deal from the biting invective and the scandalous reports to which he was subjected. His presence in the legislative tribune was commanding, and he was always listened to with the respect and admiration which his exquisite French and charming oratory compelled."

THE "MAGNIFICAT."

EVERY burst of true religious life is accompanied by its burst of religious poetry. This is marked in our own most popular hymn-books by the names of Luther, Wesley and Whitefield, Keble and Newman.

St. Luke's Gospel shows us that it was so just before our Lord's appearance. All through that Gospel, indeed, an attentive ear can catch choral vibrations. Its close is anthem-like. But more especially is this the case with its opening chapter. The air is full of song. The whole field is in flower.

Observe the historical frame-work in which the *Magnificat* is set. Mary was very liable to be misconstrued by the world. She was

called upon to bear the cross which is heaviest for the purest souls—a cross of shame. In Nazareth she could not remain. She turned to the spot towards which she seemed to be invited by an angel's lips and pointed by an angel's finger. A light twinkled for her among the hills. If, as seems most probable, Elisabeth lived at Hebron, the journey would be, for a traveler supplied with the best horses of the country, one of seven or eight hours; for one unable to procure such help, about twice that length of time. The journey lies through one of the sternest and wildest routes in Palestine. The solitude is the most desperate which travelers of experience have ever traversed. The scenery is so stern that the very mountains of Moab, touched as they are with a beautiful rosy tint, present a contrast which is almost a relief. At the end of her second or third day's journey—probably late on the third—lines of blue smoke, piercing a sky touched by the twilight shadows, told the Virgin that she was drawing near to Hebron. The softer and more humanized character of the landscape might insensibly communicate a measure of relief to that aching heart. Yet Hebron was a spot which could scarcely be entered without solemn associations, by one whose spirit habitually breathed and moved in the atmosphere of the Old Testament Scriptures. It not only included the grotto of Machpelah, the last resting-place of Sarah, of Abraham, of Isaac, Rebekah, Leah, Jacob, its foundation ascended to an antiquity which just exceeded that of Tanis in Egypt. Long before the Canaanites came the gigantic shapes of Anakim and Rephaim moved through the primeval forests by which it was surrounded. The Canaanites gave it the name of Arba, a great warrior of the Anaks (Kirjath-arba). These distant and marvelous recollections must impress the least susceptible imagination.* However this may have been, there must have been a pathos in the quiet word of the gentle maiden as she saluted Elisabeth. Elisabeth, for her part, knew her cousin's voice even before she saw her pale and suffering face. And in the power of the Holy Spirit, the babe within her quickening and seeming to leap into joyous life, she spoke with a thrilling and exultant voice, that swelled and rang out in ecstatic welcome to the mysterious Incarnation into whose presence she was brought.

"Blessed thou among women, and blessed the fruit of thy womb. And whence this to me that the mother of my Lord should come to me? For lo! as the voice of thy salutation was coming to mine ears, leaped the babe in exultation in my womb. And blessed she who shall believe that there shall be performance of those things which were spoken to her from the Lord."

It was nothing but a brief, unrecorded salutation, probably of one or two words, which drew out the amazing and magnificent acknowledgment that came home to Elisabeth with the power of the Holy Ghost, and, for a while, stirred her very frame, elevated her spirit, ennobled and transformed the tones of her voice into a rich and stately music. Here, as is so often the case, God's work is done by an unconscious influence going forth from his servants. When souls are steeped day by day in prayer and prolonged realization of the presence of God, more especially when they are in sorrow, or bearing the cross, a sweet contagion goes forth from them. A mere act of common courtesy and affection perhaps, as in the case of Mary's salutation, touches the deepest spiritual chords in other hearts.

After the prominence given to the loud, ecstatic utterance of Elisabeth it seems certain that the delicate pencil of St. Luke presents us with a real contrast in a single word. "And Mary *said*." Elisabeth's utterance and supernatural possession by the

* In the Middle Ages it was a pious opinion in the Church that Adam was created in a field of red clay, quite close to the cave of Machpelah. Pilgrims visited the cradle of the human race for the purpose of gaining indulgences by buying of the Saracen proprietor a little of the mud or clay out of which the father of humanity was formed. In the simple *Evangelium* of brother Faber (A. D. 1480) we are told that the creation took place on the 25th of March, A. M. 1. "Adam was a colossal giant, very beautiful, very learned in all liberal arts, especially astrology, geometry, music, grammar, and rhetoric."

Holy Ghost was instantaneous; it was a single and exceptional burst, a momentary elevation. But during those months when her very frame was the shrine of the Christ of God, Mary was habitually steeped in the Spirit, habitually absorbed in the great Presence by which she was inhabited. There is a noble quiet in the one word *said*. But that quiet does not exclude a great and special joy which gushed up within her soul and spirit at the words of Elisabeth. For those words are pervaded not only by enthusiastic acknowledgment of Mary's purity, but by enthusiastic recognition of the secret in her soul, of the truth of which she was the favored depositary. Every one who is possessed by a great unpopular truth finds that unpopularity one of the severest of trials. He may, indeed, and he must bring it forth to others; but he will be plied with sarcasms in the world, with texts and anathemas even in the Church. There is a joy of the purest and rarest kind when some one at last says, "The truth which possesses you has taken possession of me also. I understand you." Such was Mary's joy when she said, in the *rhyme-thought* characteristic of the structure of Hebrew poetry, the second rhythm at once repeating and passing beyond the first:

My soul doth magnify the Lord,
And my spirit did exult upon that God who is my Savior.

This song of the Virgin is especially to be noticed for the personal traits of its author that it reveals. Of these *humility* is, no doubt, the chief. She was still mindful of her *low estate*. And for this reason humility is sensitive. It has been beautifully described as "dark-hued and low; it is the violet of the soul." Mary, in the *Magnificat*, does not *profess* humility, she *practices* it. Favored, indeed, she is. Yet she has no thought of that which she *is*, only of that which, in God's free grace, she has received. In the second line she counts herself among the lost whom he has brought into a state of salvation. Her joy and exultation repose upon that God who is her Savior. Her woman's heart does, indeed, throb as it thinks of the cry which arises from the heart of redeemed humanity, as it turns to the grace which she has received—

For lo! from hence on, all the generations shall call me blessed.
For He that is mighty hath done to me great things,
And holy is his name.

"He who hath a gift," writes an excellent old divine, "and is puffed up by it, is doubly a thief; for he steals the gift and the glory of it also; and both are God's."

Mary's soul is also full of faith in the tenderness and power of God—in the incarnation of our Lord Jesus Christ. "He hath helped his servant Israel," she exclaims, using a word very like that which the author of the epistle to the Hebrews, uses in describing the way in which Jesus laid his helping hand upon, and took very close to him, not the angel's nature, but the true humanity of one born of Abraham's seed. She has the clear conviction that all which is greatest and sweetest in the attributes of God meets in the gift of his dear Son.

He that is mighty hath done to me great things; and holy is his name.
And his mercy is on them that fear him,
In remembrance of his mercy, as he spake to our fathers.

And she believes intensely in the victory of that Incarnation; in the sure triumph of God. With the instinct of a prophetess, she sees an outline of all history, and compresses and crushes the vast drama into four strong, rugged words—still as the rocks, obscure as the mists or troubled sunlights that veil them, the secrets of God, whose meaning men see when a great revolution is over, and which then goes back into silence for centuries again.

He hath
Put down the lords of dynasties from thrones.

That dethronement includes not Herod only, though it may have begun from the Idumæan usurper. Scribes and Pharisees, men of action and science; pontiffs, powerful with a power not of God; men of action which is not heavenly and science which is not true—Mary sees them sink, or their thrones stand untenanted, if they stand at all. Not always by the earthquake of war and revolution. In an old Greek city a modern engineer once remarked a mass of

stone, many tons in weight, lifted up for several feet from the ground and hanging as if suspended in the air. On looking more closely he saw that the root of a huge fig-tree had performed this achievement. By exercising an even, continued pressure every moment of the twenty-four hours for about three centuries, it had fairly lifted off this stupendous weight. Something of this strong yet gentle and gradual work is done by the influence of Christianity. A miracle of lifting is performed. The tyrant is hurled from his throne, "not by might, not by power."

Our Reformers retained this poem in the Reformed Prayer-book. A manual of public prayer, they doubtless thought, would scarcely be complete without the *Magnificat*, and other poems of the New Testament. A Scriptural service should reproduce the Bible essentially. In the Old Testament it should incorporate the Psalms. In the New Testament there are but few divine songs. But there are *some*, and surely they are there for good reasons. We can scarcely fail to remark that there is much caprice in the taste for hymns. One rarely went to a large public service fifteen years ago without hearing "Jerusalem the golden;" how often is it heard now? Hymns which were passionately applauded up to a late period are now branded as belonging to the emotional or sentimental or material or theatrical section of religion. It is, then, in the midst of this fluctuation and mutability a great thing to have some hymns whose permanence is insured by their being strictly Scriptural.

Now the *Magnificat* was breathed by Mary with the Old Testament promise fully before the gaze of her soul. "In remembrance of his mercy," she exclaims, "as he spake to our fathers, to Abraham, and to his seed for ever." She stood, as her song stands with us, between the Testaments.

The Protestant world has sometimes failed properly to recognize the high character and position of Mary. Blessed, because chosen out from all the mothers of Israel and of the earth, to an inconceivable privilege. Blessed, because consecrated as a temple for the Eternal Word; by ineffable conjunction uniting to himself that human nature which was conceived and born from her. And we purely and Scripturally honor her, not by pompous litanies, with swelling epithets, but by calling her blessed, and by chanting her own sweet and humble prophecy, in which the glory and honor are given not to her, but to her Savior. It goes up, week after week, from millions of worshipers of the Reformed faith. The *Magnificat* of Mary is one of the best antidotes to the litany of Loretto.

Jesus himself teaches us that her blessedness is ours; that so there is a strange family likeness between us and her. "But he answered and said unto him that told him, Who is my mother? and who are my brethren? And he stretched forth his hand toward his disciples and said, Behold my mother and my brethren. For whosoever shall do the will of my Father which is in heaven, the same is my brother and sister and mother." In a family which possesses some one specially gifted member, we often see looks of him in others. So the likeness of Christ is reproduced generation after generation in all the children of God. His spiritual being is reproduced in his holy family. When a woman exclaimed "Blessed is the womb that bare thee," he answered, "Yea, such a blessedness at least for those who hear the Word of God and keep it."

The brute rolling in the dust of our roads is said to have inherited associations of the free desert sands. The dog scraping and turning before he lies down to rest similarly acts from a blind reminiscence, perpetuated in the instincts of his nature, of progenitors in the prairie grass. Much more do men inherit the instinct of that praise, of which the *Magnificat* is the purest expression. Joy and peace is part of our purchased inheritance. "Peace, peace," says the divine original, with the sweet iteration which belongs to the lullaby of God, "whose mind is stayed on thee."

CULTURE AND CHRISTIANITY.

IN fact and in tendency the genius and spirit of Christianity are educatory and culturing. The reasons are good and sufficient. Intelligence, truth, and Christian culture are closely related. True wisdom is sound knowledge put to winning, useful, and effective practice. Both prophetically and historically Christianity is intimately related to the intelligence and wisdom of the past, of the present, and of the future. It sends its roots into, and is an outgrowth of the intelligence, culture, and wisdom of the divine and historic past. It declares and somewhat outlines the scholarship and wisdom of the future, as it certainly is the exponent of present civilization. From him who was "learned in all the wisdom of Egypt," from the sage of Idumea, whose profound thought, large conceptions, accurate knowledge, and advanced philosophy only equaled his admirable and exemplary piety, through prophets and poets, through the greatest of Hebrew poets and musicians, down to him whose proverbs and songs are gems of beauty and wisdom, and whose knowledge and experience were then unsurpassed, all was on a high plain of thought and culture.

As the highest order of inspiration quickened and broadened those who were prophetically and historically related to Christianity, so also "wise men of the East," by their personal presence and by the costly offerings which they brought to the infant Jesus, indicated and foreshadowed the intellectual genius and culture, the spirit and tendency of Christianity. Always among the foremost in varied culture and practical wisdom, the Hebrew and Jewish race gave noble character, educational equipoise, and mental soundness to the apostles of our Lord. Of this their writings and lives give abundant evidence. St. Paul, well instructed in both Hebrew and Grecian letters, taught in his epistles and life that courtesy and forebearance, that deference and love which tend to a high degree of culture. It is not strange, therefore, but in harmony with the analogy of things and with the demands of society that Christian experience is in the line of a graceful education and of cultured thought. It always animates soul, quickens thought, and induces gentleness and courtesy. Awakening new emotions, kindling new and holy desires, its tendency is to inquiry, research, and careful regard as to whatever improves mind, beautifies character, and awakens generous impulses. It can not be otherwise. Because of Christian experience and of the special lines of thought on which it places him, a Christian is led to such feelings and deportment as are ennobling and refining. The educational tides and influences of the world have for two thousand years had their origin and inspiration in the spirit, genius, and truths of Christianity, so much and so truly so that the Christian centuries have ever been characterized for educational institutions, educated men, and a tendency to refined society.

The earnest advice of the broad-minded, scholarly, and cultured Apostle Paul to Timothy, "Study to show thyself approved unto God, a workman that needeth not to be ashamed, rightly dividing the word of truth," is applicable now as then to the laity as to the ministry, and to young people of all time. And that Christians may be fitted for their greatest usefulness, the apostle exhorts: "Let no man despise thy youth, but be thou an example of the believers in *word*, in *conversation*. Give attendance to *reading*, to exhortation, to *doctrine*. Meditate on these things; give thyself wholly to them, that *thy profiting may appear to all*." In these and all similar advices there is sound philosophy.

Consisting as we do of soul and body, of intellect and brains, we are capable of and we need nourishment, discipline, and culture for the whole person. Body and soul need to be so harmoniously educated as that they shall be in happy accord and mutually helpful. "A sound mind in a sound body,"

is fully in the line of Christian teaching and character. As suitable food and exercise meet the demands of the one, so useful reading, careful study, and generous education meet the demands of the other, and aid in improving moral and spiritual character. Character is built up somewhat slowly, item by item, element by element. Truth is the working and feeding aliment. Reading and mental culture in the realms of science, of history, of the arts, and the humanities, are the means. Christian character and culture demand and utilize all appliances as taught in the Bible. "Bodily exercise profiteth a little;" but that godliness which includes a high degree of wisdom and spirituality, of love and purity, of "righteousness and true holiness," "is profitable unto all things, having the promise of the life that now is and of that which is to come." In this way it is that mental culture, under the patronage and within the sweep of Christian appliances, beautifies character and adorns the life. Instances are abundant. Biography records them. They who take the lead in effective reforms, who plan wisely and execute well, are persons of more or less mental culture and grace of manner. Mind is suggestive and fertile of good somewhat in proportion to the kind and quality of its resources. And reading, meditation, and study are legitimate means and helps to large and virtuous resources of thought and usefulness.

"That a soul be without knowledge, it is not good." "Add to your virtue knowledge." "He that winneth souls is wise." The first of these passages contains a profound truth. Knowledge is to the soul what food is to the body. The second teaches an important Christian duty. A knowledge of facts in science, of truths in morals, and of principles in religion, is the basis of a mental culture requisite *to win souls* to purity and truth. This is seen in the study and use of the fine arts, in the practice of the courtesies and civilities of life, and in the exhibition of the tender humanities of a Christian character, example, and influence. "Be pitiful, be courteous" is an apostolic advice and a Christian duty that comports with doing whatsoever things are true, are honest, are just, are pure, are lovely, and are of good report. The Golden Rule, which the Roman Emperor Severus caused to be placed over the door of his palace, that it might be read by all entering in, embodies and expresses the highest style of culture. It implies, also, as its solid and enduring foundation, the principles and facts of Christian experience and life. "Be ye kindly affectioned one to another in brotherly love," is a Christian duty that involves the same things, and is tenderly and sweetly shown in the reciprocal relations of life. "Follow peace with all men, and holiness." "As much as lieth in you, live peaceably with all men." These advices acted on evince the milder graces of the several relations of life, as they do the better elements of a cultured and model character. They, therefore, who read and think, who study and work, who smile and speak for the double purpose of harmoniously developing the whole mind, soul, and spirit, the emotions and the intellect, and for the purpose of furnishing it with practical and useful knowledge, are the best educated, the most cultured, and the best models. It should be the aim of individuals, of families, of schools, of communities, and of Churches to promote this high degree of intelligence and winning culture.

For the sake of a sound and discriminating judgment, of a wisely tenacious memory, and of a pure and discreet imagination, *intellect* should be variously and wisely educated. For the sake of an amiable disposition and good morals the *heart* or the *sensibilities* should have a Christian culture that reaches deeper than mere emotion or idle curiosity, that is stronger than superstition, error, frivolity, or sin, and that purifies and rectifies the conscience. That kind and style of mental culture is the best and safest which feeds, strengthens, and unfolds the intellect, which purifies and ennobles the heart, and which frees the will from error and sin. As in the human face and body, as in statuary and painting, and as in all art, symmetry and proportion, grace and beauty, are deemed essential to perfection; so do they contribute to a good education and to Christian culture. But they who are careless as to what they

do, or whether they do any thing well; as to what they read, or whether they read any thing; as to their associations, amusements, and habits—who care little whether they violate the laws of body and of mind or not; whether they live in ignorance, idleness, and vice—*these* disregard the principles of sound and attractive mental culture. Christian thought and culture tend to build up and consolidate, to purify and adorn character and open life. The emphatic "I will that women adorn themselves in modest apparel, with shame-facedness [reverence] and sobriety; not with braided hair or gold or pearls or costly array; but with good works," is virtually applicable to *men* also in their personal appearance and manners, and in their several relations and situations. A beautiful symbol of this commendable grace of modesty is the pearl, of which an old writer tersely says: "Forasmuch as the pearl is a product of life, which life from an inward trouble and sorrow and from a fault produces purity and perfection, it is preferred; for in nothing does God so much delight himself as in the tenderness and luster of virtue born of trouble and repentance."

Indications in the Church and in society seem hopeful that general intelligence and wide-spread morality, that sound education and mental culture are on the increase, and will be in the ascendant, that Christian graces will yet exceed popular vices, and that all fictitious caste will be excluded refined Christian society. Mere intellectual improvement, however, fails to secure the most desirable achievements and best results, except as it is considered to be a Christian duty and is maintained in the several relations of life. This fact was understood by the apostles of Christianity, or they had not directed their earliest and chief efforts to the great centers of intelligence, letters, and philosophy—to Athens, Rome, Corinth, the cities of Asia Minor, and to Jerusalem. From these and other centers of trade and commerce, of science and art, they gradually and wisely went into the tributary streams and into the outflowing currents of society. To such like centers do Christians now direct their chief efforts. It is wise. But it is so only or largely because of the relations of Christianity to mental culture as a duty.

Some years ago two intelligent but uneducated men of color came to my study for consultation in reference to the improvement of their race; and one of them said: "Something must be done for the education of our people, or I do n't know what will become of us. Without it we are like a man without a tongue. What would a mute give for a speaking tongue? What would *we* give for the advantages of education?"

Thus far in this essay no reference has been made to sexual distinctions in the matter of mental culture as a Christian duty, and for good reasons. Mind knows no sex; and yet in its manifestations it is somewhat modified by physical structure or bodily organization, as also by the position and vocation and by the relations and duties of life. But there is nothing in the structure of the body nor of the brain which shows that the animating and thinking soul of woman may not and should not be fitted to her duties and offices and enjoyments. For the duties, courtesies, and unbanities deemed requisite to her sphere of action, her education should be both intellectual and graceful, solid and adorning. She is the compan ion of man, the ornament of home, the conservator of society, the educator of the race. And whoever thinks that her chief end is to be dressed as a doll or plaything, and to be fondled and gallanted by shallow-brained fops, is much mistaken. In her is a charm of person far superior to external adornments. What makes the family circle more inviting than does an intelligent and cultivated Christian mother, or than do intelligent and genteel daughters and sons? But as physical organizations differ, there is needed a corresponding difference in the character and quality of education. The mental culture of women should be made up of matters of fact and of grace. The solid and structural should consist of the facts of science, of the truths of philosophy, and of the graces of religion. The ornamental should consist of whatever in art and culture, in style and manners, gives

true refinement. To solid intellectuality should be added the graces of Christian amiability and courtesy, activity, and usefulness.

In this line of thought an eloquent writer and brilliant lecturer says: "By the cultivation of the æsthetic and ideal, a poor woman enjoys the gladness of the garden from the geranium in her window, and the coal miner in his dark cavern builds brilliant castles in the air. Jonathan Edwards would walk in the fields and murmur in harmony with the locusts and the bees. Goethe said, 'Cultivate the beautiful and the useful will take care of itself.' Imprisoned in this clay, the soul craves celestial beauty. John Stuart Mill delighted in music and poetry. Frederick the Great daily gave one hour to his flute and two to his library. Quaint Thomas à Kempis's idea of heart's ease was 'to be in a nook with a book.' The æsthetic faculty is blended with the religious. Happiness has its roots in the heart, and its flowers in the soul." Examples equally illustrative of the blending of the solid and ornamental in mental culture might be adduced from the wide galaxy of cultivated and literary women.

Thus far we have written on the borderline of a positive Christian character as the highest inspiration to and the chief ornament of a sound, pure, and ornate mental culture. As the twelve precious stones in the breastplate of the high-priest, representing the twelve tribes of Israel and their several tribal characteristics, education and morals, were suspended in suitable settings from crystal buttons on his shoulders, so the graces and adornments of mental culture should and do hang gracefully from "pearls of great price." The heart is the seat and center, the fountain and the receiver of religious and spiritual life and beauty. For the sake of its best culture and government, for the sake of the highest and holiest duties, and because of its relations to the entire mental nature, and, indeed, to the bodily tastes, appetites, and habits, it needs to be "pure, right, and good." As diamonds artistically cut and highly polished are both more beautiful and valuable than in the rough or than spoiled, so our minds educated and cultured, fashioned and beautified by the graces of Christian character, are the more valuable, useful, and ornamental. Intelligence, culture, and Christian experience constitute the triple excellencies which make up a model character. The basis of intelligence is natural, inherited, and God-given. It belongs to us. Its acquisitions and products depend much on personal and social efforts of reading and study, and of a wise use of what we acquire and know. It is superior to instinct, to intuition, and to what is commonly called genius. But there may be intelligence and practical knowledge without the culture advocated in these pages. Mind can be corrupt. Knowledge can be misused. Habits may be perverse. Heart can be sinful. It is sometimes so in the case of those who think dry wit, quaintness, and personal independence are marks of originality and genius. But when associated with and adorned by mental culture, even these traits win some esteem and gracesome circles in life. As in the productions of art the beautiful, chaste, and solid gracefully blended are most admired, so are they in the best living models of all art—less in outward attire and material adornments than in mental culture and in the grace of genteel demeanor. Culture is as certainly a part of good education as is the acquisition of varied and useful knowledge. It makes what we know and use winning, captivating, effective. It adjusts suitable frames to life-pictures. It gives to living and polished jewels appropriate settings. What green and blooming trailings, and what running and fruit-bearing vines often are to otherwise rugged and barren rocks and to humble dwellings, the graces of culture are to a person, to a family, and to society.

If to these be added Christian experience and character, we have, in a measure, suited to the peculiarities of each those beautiful graces of religion which are every-where commended in the Sacred Scriptures. Being the seat of all emotion, the cradle of all sensibility, the nursery of all passion, the *heart* needs that high degree of culture which only Christian experience and life-

can give. Being strongly inclined to evil, there is special need that this susceptible center of emotions be brought under the power of sterling Christian purpose, thought, and principle.

Very closely related to the heart is the imagination, whose wings of fancy and reverie float as easily and as variously as do the white clouds of Summer. And this brilliant power of soul is a creature of education, and may become dark and foul; or it may be pure and saintly, enrobing every thing with the "beauty of holiness." The designed and appropriate offices of this buoyant faculty are to make all ugliness repulsive and all sin a reproach, to beautify truth, to adorn thought, to make virtue attractive, to give luster to character, and

"Fire-tipped and upward borne,"

to wing the soul to God and heaven.

A sound religious education, in accordance with the teachings of Christianity, is also the best guarantee of a "good conscience," whose sight is clear, whose ear is sensitive, and whose whispers are echoed voicings of the spirit of truth and grace within. An intuitional element of soul, conscience is scarcely less a creature of education, of early teachings, and of use, than is the eye or other sense. It is the moral sense; and yet its goodness or its badness depends largely on the character and culture of the heart, on the correctness of the judgment, and on the purity of settled convictions. If well informed, if uncorrupted, if holding its divinely designed relations to the whole spiritual nature of man, its intuitions and its decisions and its voicings will be right and good.

In the light of all these things we see something of the importance of a sound and well-rounded education, of the bearings of mental culture, and, from a Christian standpoint, of the *duty* of so educating the young as that, in the beautiful conceptions of the inspired Psalmist, "children shall be like olive-plants round about thy table," and "that our sons may be as plants grown up in their youth; that our daughters may be as corner-stones polished after the similitude of a palace." Considered in reference to a beautiful and well formed character, mental culture is a Christian duty that deserves the profound consideration of both the old and the young. In this way will they both "adorn themselves in that which is not corruptible, even a meek and quiet spirit, which is in the sight of God of great price, and adorn the doctrine of God our Savior in all things."

THE STORY OF A STRANGE FAMILY.

A STRANGE and horrible family history is that of the Sansons of Paris, who were for two hundred years the hereditary executioners of the court of criminal justice in Paris. Their career began under Louis XIV, in the seventeenth century, and it was still going on in the reign of Louis Philippe in the nineteenth. Kingdoms had passed into republics, republics into consulates, consulates into empires, and still they held their post. They were at times brought into very close contact with persons of all classes. King and criminal, peer and peasant, priest, and scholar, all were subject to them without appeal in the supreme moment of their lives. None resisted their decree, for they were but the tools of a mightier power. Amid carnage and terror they stood fast, growing ever in wealth and infamy.

The last of the Sansons has given a curious family history, from which the materials for this sketch are taken. He traces back his lineage with manifest pride to the times of the crusaders. A Sanson was Seneschal to Robert Diable, duke of Normandy. He hints at even greater antiquity, but modestly pronounces this but a tradition and quickly returns to facts. He dwells fondly upon the memory of Nicholas Sanson, "one of the fathers of modern geography," esteemed and honored by Richelieu, and selected by Louis XIII as his host, on a visit of that

monarch to Abbeville in 1688. At this time the Sansons belonged to the higher ranks of the *bourgeoisie*.

Charles Sanson de Longval was the first of the family who accepted the post, or, as one author has it, "adopted the profession," of executioner. After seven years spent in more extensive travel than was common at that day, he had entered the army, where he held the rank of lieutenant. His regiment, in the year 1662, was quartered at Dieppe, where, through an accident, he formed the acquaintance of a beautiful girl, Marguerite Jouanne. For a long time he had no idea of her real circumstances; but, discovering her at last to be the daughter of the executioner, he sought her to bid her farewell forever. The story is a tragic and a touching one; but we have no time to dwell upon it. In the end love and remorse conquered, and he accepted the only terms upon which Pierre Jouanne would give him his daughter to wife, that of, in his turn, adopting the "profession" of public executioner. That he repented the step, we can not say; that the duties of the post were abhorrent to him, we know; but the deed was done, and from father to son the office descended, until, in 1847, the last survivor succeeded in freeing himself from the terrible fetters which his ancestors had assumed.

In the light of the doctrine of heredity this family history might offer a curious study. Surely one might be inclined to think a family which for two hundred years lived by the blood of its fellow beings must be thoroughly hardened, brutalized if you will, inaccessible to the softer emotions of humanity. We figure each of its members to ourselves as a species of ghoul or vampire, reveling amidst horrors which sicken us, gloating over the sufferings of his victims, without one pang of pity or remorse. And yet, to this picture to which our reason and our instinct assent, these memoirs (whether truly or not) give the lie. In the course of time, it is true, a horrible species of morbid pride developed itself (in what soil will it not flourish?) which kept them at their post when nature sickened and revolted; but even the lurid and bloody figure of the executioner of the revolution, hardest and most brutal of all the Sansons, is lightened by some gleams of humanity. We see the prisoners led to the scaffold amidst the jeers and insults of the populace, when the only soul to pity them, the only tongue to utter a word of courage and consolation is that of the executioner. We see him, out of compassion for the tortures of his victims, defying the law in order to give the sufferers a speedier release. We see him fainting and faltering beneath his horrible task, sustained only by this curious, distorted sense of family honor and duty to the state. True, these memoirs are written by the descendant of the Sansons, and we must make allowances for the effect of family pride and affection, but may we not believe that, even amidst these men of infamy and horror, all humanity had not been crushed out, even by their bloody and revolting work?

Strange to say, those who were sternest and most implacable in their determination that the office should be kept in the family were not those who were allied to it by blood, and in whom the influence of heredity might be supposed to work; but outsiders, who were allied to it only by marriage. When Charles Sanson, the second in the succession, died, in 1726, he left two sons, the elder of whom was but seven years old. Then the fatal office would have passed into other hands but for the determination of the widow, Martha Dubut. She succeeded in her determination to preserve the heritage to her children, and *questionnaires* were appointed to discharge the duties in the name of the little Charles Jean Baptiste during his minority. In the year 1754, Jean Baptiste was struck with paralysis. As his eldest son was but fifteen, the office was a second time in danger of passing from the family. Again Martha Dubut came forward, and, proving her grandson Charles Henri Sanson to be capable of filling the position, secured his appointment. From this time he superintended the executions in the place of his father, who regained his former energy only upon one occasion, the circumstances connected with which are sufficiently curious to warrant their narration.

One evening many years before, a party of young men had lost their way in one of the suburbs of Paris. In the midst of their bewilderment they came upon a large house in which it was evident that a festivity of some sort was going on. With the audacity of youth they requested permission to enter and join in the merriment. The master of the house, whose marriage was being thus celebrated, consented to their request, but warned them that they might regret their action on learning the name and rank of their hosts. Nothing daunted, however, the young men still persisted, and, in spite of the dark and saturnine countenances of the greater number of the company, spent a merry night. As they were about to leave, the bride-groom again approached them, asking whether they had no curiosity to learn his name and rank. The name was Jean Baptiste Sanson, the rank, Executioner of Paris. To all but one of the young men the news was a shock, but the handsomest of them all laughed lightly. He had long wished, he said, to make the acquaintance of one of these gentry, and, now that he had at last done so, he begged that M. Sanson would show them his instruments. His request being granted, he examined the swords with the deepest interest. One in particular excited his curiosity, and he asked many questions, to which Jean Baptiste Sanson replied that if fate ever brought them together in a more public capacity, he would promise the young man that his sufferings should be short.

Thirty-five years later a brave old man was sentenced to death for mistakes and misdemeanors during his Indian career, which, in the eyes of his judges, assumed the proportions of crimes. This old man was Count de Lally-Tollendal, and he it was to whom Jean Baptiste Sanson had made the above singular promise. In the mean time Jean Baptiste had become paralyzed, and his son Charles Henri discharged the functions of his office, though his father was still present at the executions. The old man (Count Lally) was brought to the scaffold gagged, but Jean Baptiste approaching him, removed the gag and bowing respectfully said: "M. le Comte, I am master here. As it happened thirty-five years ago, you are my guest. Accept the supreme hospitality which I then promised you. You can speak if you like."

"I have spoken enough to man, I have now to speak to God," was the reply, and, after a short prayer, he laid his head calmly upon the block.

Charles Henri raised the sword which thirty-five years before Count Lally had handled; but the first blow failed. The old man sprang to his feet and turned a look of anger and reproach upon his torturer. At this horrible sight Jean Baptiste for one instant regained the strength of which for twelve years he had been deprived. Springing forward he caught the sword from his son's hand, and with one blow released the sufferer.

One of the incidents in these memoirs which strikes us as most singular, befell this Charles Henri Sanson. He, if we can judge from the narrator's account, showed the traces of his ancient lineage in his manners and bearing. Handsome, polished, and courtly, he delighted to set off his natural advantages by the aid of rich and becoming dress. On one occasion, in the course of a sporting tour, he encountered at an inn a certain Mme. la Marquise, who was on her way from her country-seat to Paris. Encouraged by her he entered into conversation and they finally dined in company. Scarcely had M. Sanson left the inn, when a gentleman, who had recognized him, informed Mme. la Marquise of the name and position of her late companion. She was cast into a state of horror and disgust at the news, called for water to wash the hands which had been contaminated by the touch of an executioner, and, on arriving at Paris, petitioned parliament for the punishment of the man who had, from her point of view, insulted her. M. Sanson, finding it impossible to obtain a barrister to defend him, was obliged to plead his own cause.

The same question virtually was brought up some time later in the form of a discussion before the National Assembly in 1789, as to the rights of executioners as regards

the privileges of citizenship. After some discussion the question was decided by the words of Robespierre: "It can never be said in this assembly that a necessary function of the law can be branded by the law. Such a law must be changed."

M. Sanson's curious petition on this occasion shows that the candidates for the office of executioner must be men of good character and that they take the oath like any other public functionary. The whole petition is a curious specimen of plausible reasoning and indignant protest against real or fancied injustice. He shows by numerous examples that the office of executioner was formerly held to be a highly honorable one, and this even in France; dwells upon the virtues of some well-known members of the "profession," and closes with a request that a fine of one hundred livres may be exacted from those who apply the term *bourreau* to an executioner. The assembly treated the petition with a silence which M. Sanson was obliging enough to consider satisfactory.

It may be interesting to our readers to learn the origin of the obnoxious term to which M. Sanson objected. It is derived from the name of one Borel, who, in 1620, combined the duties of priest and executioner. As, however, the Church objects to the shedding of blood, he employed a layman to discharge his duties in the latter capacity. Thence it became customary to speak of executioners as Boreaux, and gradually the orthography was changed to its present form of bourreaux.

A curious history is given of the abolition of tortures in connection with public executions: Jean Lonschart, the son of a smith at Versailles, was sentenced to death for the murder of his father, Mathurin Lonschart. The provocation had been terrible; the murder so purely accidental that until the son was arrested he was ignorant that his father had even been injured. As he was rushing from the shop after a violent quarrel he had flung behind him a hammer which, striking the father upon the head, had killed him instantly. The court condemned him to death; the populace, convinced of the injustice of the sentence, determined upon his rescue. Already the first ripples of the Revolution had spread throughout the land. The people had awakened at last to a sense of their injuries and their power. On the day of the execution the erection of the scaffold went on unimpeded by the throng which watched it, but the eye of the executioner had marked the gathering of the storm. Suddenly the crowd surged forward, the prisoner was snatched from the very steps of the scaffold. The executioner—Charles Henri Sanson—supposed that his last hour had come, but he was passed in safety through the crowd with the exhortation, "Henceforth, Charlot, you must kill your customers without making them suffer." The scaffold was torn to pieces, the fragments piled together, the heap crowned with the horrible wheel, and fired. Around this bonfire men and women, with hand linked in hand, danced madly until the last plank was consumed.

This was probably the first step in the direction of a mitigated form of capital punishment. Toward the end of the year 1789 Dr. Guillotin, deputy of the *tiers état* of Paris, presented for consideration a law by which decapitation was made the punishment for all capital offenses without distinction of rank. Up to this time the mode of death had been curiously proportioned (or disproportioned) to the gravity of the offense, but the wheel had obtained a horrible predominance. Dr. Guillotin also urged the adoption of some mechanical means of execution to prevent the recurrence of the revolting scenes only too common, where the sufferings of the victim were frightfully prolonged and aggravated. At this time, though several such machines had been invented and even used, none of them had attained the requisite degree of perfection. Dr. Guillotin and Charles Henri Sanson consulted together on the subject, but for a long time in vain. At last, however, one Schmidt, a German engineer and musician, with whom M. Sanson was in the habit of playing duets, solved the problem. M. Sanson happened to mention to him the subject of their perplexity. M. Schmidt, after a moment's hesitation, took up a piece of paper and sketched

upon it the form of the guillotine, which which was afterwards adopted. In other accounts Schmidt is spoken of as the carpenter who constructed it; but M. Sanson contradicts this, affirming that Schmidt had been restrained by conscientious scruples from communicating his idea before. The carpenter to whom its construction was finally intrusted was named Guidon. Not the least curious circumstance connected with the affair is that the king (Louis XVI), hearing of the new invention from his physician, Dr. Louis, expressed a desire to examine the model himself. M. Sanson took it to the Tuileries, where the king examined it carefully, and expressed his satisfaction with it, except as regarded the shape of the knife, which, he said, would not suit all throats. M. Sanson admitted that the criticism was a just one, and the king, whose mechanical tastes are well known, taking up a pin, altered the shape of the knife from a crescent to the oblique form which was afterwards adopted. When this objection was first pointed out M. Sanson noticed that the king's own throat was precisely the shape to which the knife, in its first form, was not adapted. Did the king remember this scene on his next meeting with Charles Henri Sanson on the 21st of January, 1793?

"It seems as if you had made a revolution only to give me work!" cried the executioner, in the midst of the bloody scenes of that fearful era.

Over nearly two hundred and fifty pages of the memoirs the story spreads, painting for us, from the inside, the history of those dark days, a story of reckless and unbridled brutality, of despair, of horror. Yet, here and there, even amidst these wild and bloody scenes, are scattered fragments full of heroic tenderness, or grim, fantastic humor.

"Bind these hands, which were the first to sign the declaration of the rights of man!" cries Barnave, holding out his wrists calmly to the executioner.

"I can only spare you the sight of blood; go first, poor man!" says Mme. Roland, compassionately, to her trembling, fainting companion upon the scaffold.

"Look at me," exclaims the young wife of Camille Desmoulins, "and say whether my face is that of a woman who needs consolation? My only wish since Camille's death has been to join him. If I did not detest those who have condemned me, because they murdered the best and most honest of men, I would bless them for the boon they confer upon me;" and so dies "without even turning pale."

A certain Englishman visits Charles Henri Sanson, and offers him money if he will allow him to act as his assistant for a single day. On being questioned, he declares his sole motive for the request to be curiosity. He had come to Paris to see a revolution of which the whole world is talking, and does not wish to return without having witnessed every phase of it. Sanson refuses his request, warning him that if he achieve his object he will in all probability be detected and executed as a spy. The Englishman listens composedly, and avows his fixed intention of assisting at an execution in spite of M. Sanson. Two or three weeks pass, and no more is heard of him. On the 4th Germinal eighteen prisoners are to be executed. When the carts come up to convey them to the scaffold, M. Sanson perceives among the drivers one with a fair beard. It is again the Englishman, still bent upon the gratification of his innocent curiosity. He has found the assistants more accessible to bribes than the executioner. M. Sanson refrains from attracting attention to him, but simply remarking that there are more carts than are needful, orders him to return with the one under his charge. The Englishman hesitates, but the *gens d'armes* are near, and he finally drives off with an "*Au revoir!*" If he made any further attempts in the same direction he did so undetected. Let us hope that his modest ambition was at last gratified!

Thus the dreary record goes on; but at length the executioner's nerve is failing him under the accumulated horrors.

"There are those who smile when I appear," he says. "These smiles produce a singular effect upon me. Experience has made me callous, and I can bear the horror

with which we executioners are regarded; but to get accustomed to people who almost say, 'Thank you,' when they are led to the guillotine is more difficult."

What those times were, we all know. All have figured to themselves, more or less vividly, the unutterable horrors of the Reign of Terror. What wonder that they unnerved him to whom the whole mystery of horror was most fully laid bare? His father, Jean Baptiste Sanson, and he had been the two of the family who had been most thoroughly reconciled to their position, who, indeed, "almost liked their work." Where others failed, they had stood firm; but even this stern and bloody man is overcome at last. After the execution of Cécile Renaud and Ladmiral (the would-be assassins of Robespierre and Collet), together with fifty-two others, he writes:

"I do not boast of extraordinary squeamishness; I have seen too much blood in my life not to be callous. If what I feel is not pity it must be a derangement of my nerves. Perhaps I am punished by the Almighty for my cowardly obedience to mock justice."

Horrible visions haunt his mind; his hands tremble; his nerve fails him. The present loses its reality, and he performs the duties of his office in a horrible dream. Nemesis has overtaken him at last, in spite of his distorted ideas of honor and duty. More than once he succumbs entirely, and "nearly faints," or is obliged to leave the scaffold and return home.

For him the end comes none too soon. Robespierre falls, and with him the reign of carnage ceases. The public is sated with blood, and the executioner may rest at last from his labors. What rest could be his; the old man, whose eyes are haunted by the sight of the blood he has spilled, in whose ears rings forever the last shriek of his victims, the dull thud of the falling ax? Two more glimpses of him are given to us. In his old age he finds his chief pleasure in cultivating his garden. Strange contrast to his former employment! Yet even here the memories of the past are present with him, for his little grandson hears him mutter as he pauses before a bed of bright red tulips:

"How fresh; how red they are! If they saw them, they would say that I water them with blood!"

Yet neither honor nor remorse prevent the stern old man from driving his grandson on in the path which all the family have followed, since Sanson de Longval loved the executioner's daughter. Half an hour before his death he calls his son Henri to his bedside to receive his last words. These words are a repetition of the curious, distorted conviction of duty and honor which has kept him firm at his post through life. He charges him never to forsake the hereditary "profession." He tells him that to give up his office would be a desertion of duty, a breach of family honor; that, moreover, it would be useless, because, whatever path he might choose the hereditary stigma would still cling to him. Yet he assures him that, though men may despise and, indeed, insult him, they will do it without just grounds.

"Do not forget," he says, "that the judge who passes sentence is more responsible than you are."

The father had not intended that his son should follow in the family footsteps, but the words of the grandfather seal his fate. At first, however, he is kept in ignorance of his hereditary position. He is educated as other boys are, and does not suspect the fatal barrier between him and his fellows, but the awakening, when it comes, is only the more cruel. He has formed an intimate friendship with one of his school-mates, and the friendships of boyhood are very true and tender. One day he enters the school-room and finds every thing changed. All his school-mates avoid him, and this intimate friend among the rest. Hurt and wounded, the poor little Henri will not at first demand an explanation, but his grief will not long be borne in silence. For sole answer to his questions, his former friend sketches upon a bit of paper the figure of a guillotine, with victim and executioner, and writting below it, "*Tuus pater carnifex!*" holds it towards him. The whole terrible mystery suddenly bursts upon the boy's mind. Perplexities of the past become clear in the light of this revelation. Overpowered by

agony he rushes home and faints at his mother's feet.

The mother would have saved him from the family fate, but the father is inexorable. He strives to resign himself, but his loathing for his future grows more and more insupportable. He, you see, has not been prepared for his position like the rest of the family, and, in his case, heredity without education proves but a frail reed. He might have cast off the fetters, you say? But it must be a very exceptional boy of thirteen—a French boy, too—who can successfully defy his family, with the traditions of six generations behind them. The grandmother, too, like Martha Dubut in a former generation, endeavors, by her sophistical arguments, to reconcile him to his fate. He yields at last, but, overcome with horror at his first execution, is obliged to leave every thing to his assistants, and finally runs away. After that he becomes more callous, though, according to his own account, he never entirely loses his natural horror of his "profession." As long as his father lives he resigns all hope of escape, and, dying, that father exacts from the son a promise that he will never voluntarily give up his office. He keeps his word, but deliberately neglects the duties of his profession, in the hope, which is finally fulfilled, that he may be dismissed from his office.

And so, at last, the family of Sanson sinks out of public, sight the fondest hope of the survivor being that their very memory may be lost forever, leaving as a legacy to the world only this most curious chapter of history.

LES PETITES.

A FEW years since, one of our most eminent artists produced a painting that, at the time, called forth considerable notice and praise from art critics all over the country. It was called "The Court Favorite," and represented a dwarf, tricked out in the gayest of court finery, descending the broad stairway of a grand palace, while at the foot a group of magnificently attired courtiers stand with reverently bowed and uncovered heads as if in the presence of royalty itself.

The proud and supercilious air of the little man is curiously contrasted with the suspicious look upon his face, as he casts a half-triumphant, half jealous look at the courtly sycophants, as if suspecting, in spite of himself, the secret scorn that underlies all this politic air of deference and respect.

Besides the amusement and pleasure to be derived from the contemplation of this picture, there is to the curious in such matters food for reflection upon the lives and characters of a class of human beings who, unfortunate in their partial isolation from their fellow creatures, have yet, in many cases, played no unimportant part in the world, where they seem to have been intended by nature to fill only very insignificant places.

Far back in an early period of the world's history we find honorable mention made of the most celebrated of these "little folks," whose minds seem to have risen far superior to the puny tenements that they were forced to occupy. Hippocrates tells us of a poet named Philetas, a contemporary of his own, who was so exceedingly diminutive that he was forced to carry leaden weights in his pockets to keep himself from being blown away by the wind. He was an accomplished scholar, and was preceptor to Ptolemy Philadelphus. Another poet called Aristratus is mentioned, of whom it is gravely recorded that he was "so small that nobody could see him,"—a curious exaggeration, reminding one of the fable of the nymph "Echo," whose only possession was a *voice*.

A noted logician and philosopher of Alexandria, named Alypias, was but one foot five inches and a half high; while Julia, the niece of Agustus, had two learned dwarfs, a male and female, each of whom was but two

feet and a hand breadth in height. The emperor himself introduced upon the stage a noted actor whose stature was but two feet.

Throughout the Middle Ages, and even in modern times, these diminutive specimens of humanity have, in many cases, enjoyed the patronage and favor of the greatest sovereigns the world over—petted and pampered at court, yet, like all other playthings, subject to the caprices and ridicule of their royal patrons, who seem seldom to have realized that, however diminutive the body, its owner might have a soul as sensitive and proud as that of the noblest courtier in their train.

Of Peter the Great it is recorded that he found much delight and amusement during his leisure hours in romping with and petting his dwarfish playfellows, of whom he had seven. It was a favorite jest with him at his numerous feasts, to order a dwarf served up in a pastry—a female dwarf for the gentlemen's table, and a male for that of the ladies. These tiny creatures, at a given signal, emerged from their strange prison house and danced or performed acrobatic feats upon the table for the amusement of their royal master and his guests.

Several of Peter's biographers mention, as a proof of his natural kindness of heart, a little incident that occurred during his celebrated visit to England in the early part of his reign. Coaches had been provided by the English monarch to convey his royal visitor about London, on a sight-seeing excursion, and just as they were about to start it was found that there was no room in the czar's coach for his favorite dwarf, who always accompanied him upon his travels. The attendants motioned the manikin to another carriage, but Peter interfered, and settled the matter by taking the little fellow on his own knee, a seat of honor that he occupied with undisguised triumph during the entire drive.

One of the most celebrated dwarfs of which history retains a record is Sir Geoffry Hudson, favorite, courtier, and soldier in the court of the unfortunate Charles I, and a special favorite of his beautiful queen Henrietta Maria, to whose service the doughty little champion considered himself specially dedicated.

His first appearance at court was in a pie served up for her majesty at an entertainment given by the Duke of Buckingham, who, with mock ceremony, presented him as a gift to her amidst the laughter and applause of the delighted courtiers. He was at that time eight years of age, and only eighteen inches high, but when thirty years old he began to grow until he reached the height of three feet nine inches.

Although so diminutive in body, the little man seems to have been both sagacious and brave, with a high sense of his own personal importance that furnished a never-failing source of amusement for the fun-loving gallants of the court. One of these frolics had, however, so tragical a termination that men became more wary of sharpening their wits at the expense of the fiery little brave. A Mr. Crofts, a young gentleman of high family and a great favorite at court, carried his jests upon the dwarf so far that the latter deemed it necessary to resent the insult, and sent him a formal challenge, which was with all due solemnity accepted. But taking advantage of his right as the challenged party to choose his weapons, Crofts appeared upon the field armed with a huge squirt-gun with which he gravely proceeded to drench his enraged and mortified opponent. This was an indignity that only blood could wash out, and Sir Geoffry insisted on having his satisfaction with pistols. Mr. Crofts was forced at last to consent, and was instantly shot through the heart by the unerring bullet of the despised dwarf.

The face and figure of this remarkable creature were immortalized by the brush of Vandyke, from which painting it is probable that Scott drew his characteristic pen-portrait that all readers of "Peveril of the Peak" will be sure to remember:

"Geoffry Hudson, although a dwarf of the least possible size, had nothing positively ugly in his countenance, or actually distorted in his limbs. His head, hands, and feet were, indeed, large and disproportioned to his height, and his body itself was much thicker than was consistent with symmetry,

but in a degree that was rather ludicrous than disagreeable to look upon."

Faithful among the faithless, the bold dwarf led a troop of horse at the battle of Marston Moor, where in defense of his imperiled master he fought with a courage and desperation that might have shamed many a tall cavalier who fled ignominiously from that bloody field of doom. After Charles II's restoration this faithful little adherent of his unlucky house basked for a short season once more in the familiar sunshine of court favor. But his season of prosperity was short; for being suspected of having been connected with the celebrated "Popish Plot," the poor little man ended his life in the gloom and obscurity of a prison, having reached the advanced age of sixty-one years.

A counterpart to the fidelity and courage of this faithful servant of an unfortunate master is found in the favorite dwarf of Marie Antoinette, who, when the palace of the Tuileries was besieged by an infuriated Parisian mob, aided most effectually in its defense by mounting to the roof in full view of the howling demons below, and pouring down hot, melted lead upon the heads of those who were trying to force the doors of the palace that they might glut their rage upon its helpless inmates.

Another notable dwarf was Count Joseph Borowlaski, a Polish nobleman, born in the year 1739, of ordinary sized parents who, in a family of six children, had three who were dwarfs of the most diminutive stature. Joseph wrote a history of his own life, in which he mentions that his eldest brother was three feet six inches, himself two feet and four inches at the age of twenty, while a younger sister, who died at the age of twenty-three, was so small that she could stand beneath his outstretched arm. At the age of fifteen he went to Vienna, where he was presented at the court of the Empress Maria Theresa, who seems to have been perfectly delighted with the handsome courtly little gentleman. His wit and tact never failed him under any circumstances, and when the empress, who was at war with Frederic of Prussia, asked his opinion of that monarch, the tiny courtier's gallant reply was: "Madame, I have not the honor to know him, but were I in his place, instead of waging war with the most beautiful and gracious princess in the world, I would hasten to Vienna to pay my respects to her, thinking it far greater honor to gain her esteem than to win the greatest of warlike victories over her."

The empress laughed heartily at this adroit compliment, and taking the little flatterer upon her lap she kissed him; whereupon he laughed merrily, and when questioned as to the cause of his mirth, replied: "It is so funny to see so small a man upon the lap of so great a woman."

He visited the various European courts, at all of which he was received with every mark of favor, especially by the ladies, who were every-where delighted with his wit and gallantry. He was married in early life to a woman of ordinary size, and became the father of a family of full-grown, intelligent children. He died in England at the extreme age of ninety-eight.
